DATA SHEET

MB814100A-60/-70/-80

CMOS 4M x 1 BIT FAST PAGE MODE DRAM

CMOS 4,194,304 x 1 BIT FAST PAGE MODE DYNAMIC RAM

The Fujitsu MB814100A is a fully decoded CMOS Dynamic RAM (DRAM) that contains a total of 4,194,804 memory cells in a x1 configuration. The MB814100A features a "fast page" mode of operation whereby high-speed random access of up to 2,048-bits of data within the same row can be selected. The MB814100A DRAM is ideally suited for mainframe, buffers, hand-held computers video imaging equipment, and other memory applications where very low power dissipation and high bandwidth are basic requirements of the design. Since the standby current of the MB814100A is very small, the device can be used as a non-volatile memory in equipment that uses batteries for primary and/or auxiliary power.

The MB814100A is fabricated using silicon gate CMOS and Fujitsu's advanced four-layer polysilicon process. This process, coupled with three-dimensional stacked capacitor memory cells, reduces the possibility of soft errors and extends the time interval between memory refreshes. Clock timing requirements for the MB814100A are not critical and all inputs are TTL compatible.

PRODUCT LINE & FEATURES

Parameter		MB814100A-60	MB814100A-70	MB814100A-80
$\overline{RAS}$ Access Time		60ns max.	70ns max.	80ns max.
$\overline{CAS}$ Access Time		15ns max.	20ns max.	20ns max.
Address Access Time		30ns max.	35ns max.	40ns max.
Random Cycle Time		110ns min.	125ns min.	140ns min.
Fastpage Mode Cycle Time		40ns min.	45ns min.	45ns min.
Low Power Dissipation	Operating current	605mW max.	550mW max.	495mW max.
	Standby current	11mW max. (TTL level) 5.5mW max. (CMOS level)		

- 4,194,304 word x 1 bit organization
- Silicon gate, CMOS, 3D-Stacked Capacitor Cell
- All input and output are TTL compatible
- On chip substrate bias generator for high performance
- Common I/O capability by using early write
- $\overline{RAS}$ only, $\overline{CAS}$-before-$\overline{RAS}$, or Hidden Refresh
- Fast Mode, Read-Modify-Write capability
- 1024 refresh cycles every 16.4ms

ABSOLUTE MAXIMUM RATINGS (see Note)

Parameter	Symbol	Value	Unit
Voltage at any pin relative to VSS	V_{IN}, V_{OUT}	–1 to +7	V
Voltage of V_{CC} supply relative to VSS	V_{CC}	–1 to +7	V
Power Dissipation	PD	1.0	W
Short Circuit Output Current		50	mA
Storage Temperature	TSTG	–55 to +125	°C

Note: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

Input Low Voltage, all inputs [1]	VIL	–2.0		0.8	V	

FUNCTIONAL OPERATION

ADDRESS INPUTS

Twenty-two input bits are required to decode any one of 4,194,304 cell addresses in the memory matrix. Since only eleven address bits (A0-A10) are available, the column and row inputs are separately strobed by $\overline{RAS}$ and $\overline{CAS}$ as shown in Figure 5. First, eleven row address bits are applied on pins A0 through A10 and latched with the row address strobe ($\overline{RAS}$) then, eleven column address bits are applied and latched with the column address strobe ($\overline{CAS}$). Both row and column addresses must be stable on or before the falling edge of $\overline{RAS}$ and $\overline{CAS}$ respectively. The address latches are of the flow-through type; thus, address information appearing after t_{RAH} (min)+ t_T is automatically treated as the column address.

WRITE ENABLE

The read or write mode is determined by the logic state of $\overline{WE}$. When $\overline{WE}$ is active Low, a write cycle is initiated; when $\overline{WE}$ is High, a read cycle is selected. During the read mode, input data is ignored.

DATA INPUT

Input data is written into memory in either of two basic ways — an early write cycle and a read-modify-write cycle. The falling edge of $\overline{WE}$ or $\overline{CAS}$, whichever is later, serves as the input data-latch strobe. In an early write cycle, the input data is strobed by $\overline{CAS}$ and the setup/hold times are referenced to $\overline{CAS}$ because $\overline{WE}$ goes Low before $\overline{CAS}$. In a delayed write or a read-modify-write cycle, $\overline{WE}$ goes Low after $\overline{CAS}$; thus, input data is strobed by $\overline{WE}$ and all setup/hold times are referenced to the write-enable signal.

DATA OUTPUT

The three-state buffers are TTL compatible with a fanout of two TTL loads. Polarity of the output data is identical to that of the input; the output buffers remain in the high-impedance state until the column address strobe goes low. When a read or read-modify-write cycle is executed, valid outputs are obtained under the following conditions:

- **t_{RAC} :** from the falling edge of $\overline{RAS}$ when t_{RCD} (max) is satisfied.
- **t_{CAC} :** from the falling edge of $\overline{CAS}$ when t_{RCD} is greater than t_{RCD} (max).
- **t_{AA} :** from column address input when t_{RAD} is greater than t_{RAD} (max).

The data remains valid until either $\overline{CAS}$ returns to a High logic level. When an early write is executed, the output buffers remain in a high-impedance state during the entire cycle.

FAST PAGE MODE OF OPERATION

The fast page mode of operation provides faster memory access and lower power dissipation. The fast page mode is implemented by keeping the same row address and strobing in successive column addresses. To satisfy these conditions, $\overline{RAS}$ is held Low for all contiguous memory cycles in which row addresses are common. For each fast page of memory, any of 2,048 bits can be accessed and, when multiple MB814100s are used, $\overline{CAS}$ is decoded to select the desired memory fast page. Fast page mode operations need not be addressed sequentially and combinations of read, write, and/or ready-modify-write cycles are permitted.

DC CHARACTERISTICS
(Recommended operating conditions unless otherwise noted) [3]

Parameter		Symbol	Conditions	Value			Unit
				Min	Typ	Max	
Output high voltage [1]		V_{OH}	I_{OH} = –5 mA	2.4			V

57	Fast Page Mode $\overline{CAS}$ Precharge to $\overline{WE}$ Delay Time	t_{CPWD}	35		40		40		ns

Notes:
1. Referenced to VSS
2. I_{CC} depends on the output load conditions and cycle rates. The specified values are obtained with the output open. I_{CC} depends on the number of address change as $\overline{RAS}=V_{IL}$ and $\overline{CAS}=V_{IH}$. I_{CC1}, I_{CC3} and I_{CC5} are specified at one time of address change during $\overline{RAS}=V_{IL}$ and $\overline{CAS}=V_{IH}$. I_{CC4} is specified at one time of address change during one Page Cycle.
3. An Initial pause ($\overline{RAS}$ =$\overline{CAS}$ =VIH) of 200µs is required after power-up followed by any eight $\overline{RAS}$-only cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of eight $\overline{CAS}$-before-$\overline{RAS}$ initialization cycles instead of 8 $\overline{RAS}$ cycles are required.
4. AC characteristics assume t_T = 5ns.
5. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also transition times are measured between VIH (min) and V_{IL} (max).
6. Assumes that $t_{RCD} \leq t_{RCD}$ (max), $t_{RAD} \leq t_{RAD}$ (max). If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will be increased by the amount that t_{RCD} exceeds the value shown. Refer to Figures 2 and 3.
7. If $t_{RCD} \geq t_{RCD}$ (max), $t_{RAD} \geq t_{RAD}$ (max), and $t_{ASC} \geq t_{AA} - t_{CAC} - t_T$, access time is t_{CAC}.
8. If $t_{RAD} \geq t_{RAD}$ (max) and $t_{ASC} \leq t_{AA} - t_{CAC} - t_T$, access time is t_{AA}.
9. Measured with a load equivalent to two TTL loads and 100 pF.
10. t_{OFF} is specified that output buffer change to high impedance state.
11. Operation within the t_{RCD} (max) limit ensures that t_{RAC} (max) can be met. t_{RCD} (max) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (max) limit, access time is controlled exclusively by t_{CAC} or t_{AA}
12. t_{RCD} (min) = t_{RAH} (min)+ $2t_T$ + t_{ASC} (min).
13. Operation within the t_{RAD} (max) limit ensures that t_{RAC} (max) can be met. t_{RAD} (max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (max) limit, access time is controlled exclusively by t_{CAC} or t_{AA}
14. Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.
15. t_{WCS}, t_{CWD}, t_{RWD} and t_{AWD} are not a restrictive operating parameter. They are included in the data sheet as an electrical characteristic only. If $t_{WCS} \geq t_{WCS}$ (min), the cycle is an early write cycle and D_{OUT} pin will maintain high impedance state throughout the entire cycle. If $t_{CWD} \geq t_{CWD}$ (min), $t_{RWD} \geq t_{RWD}$ (min), and $t_{AWD} \geq t_{AWD}$ (min), the cycle is a read modify-write-cycle and data from the selected cell will appear at the D_{OUT} pin. If neither of the above conditions is satisfied, the cycle is a delayed write cycle and invalid data will appear the D_{OUT} pin, and write operation can be executed by satisfying t_{RWL}, t_{CWL}, t_{CAL} and t_{RAL} specifications.
16. t_{CPA} is access time from the selection of a new column address (that is caused by changing $\overline{CAS}$ from “L” to “H”). Therefore, if t_{CP} is long, t_{CPA} is longer than t_{CPA} (max).
17. Assumes that $\overline{CAS}$-before-$\overline{RAS}$ refresh.
18. Assumes that Test mode function.

Test mode set cycle (CBR)	L	L	L				High-Z	Yes	$t_{CSR} \geq t_{CSR}$ (min) $t_{WSR} \geq t_{WSR}$ (min)
Test Mode set cycle (Hidden)	H → L						Valid	Yes	$t_{CSR} \geq t_{CSR}$ (min) $t_{WSR} \geq t_{WSR}$ (min)

Notes: X= “H” or “L”

1. It is impossible in Fast Page Mode.

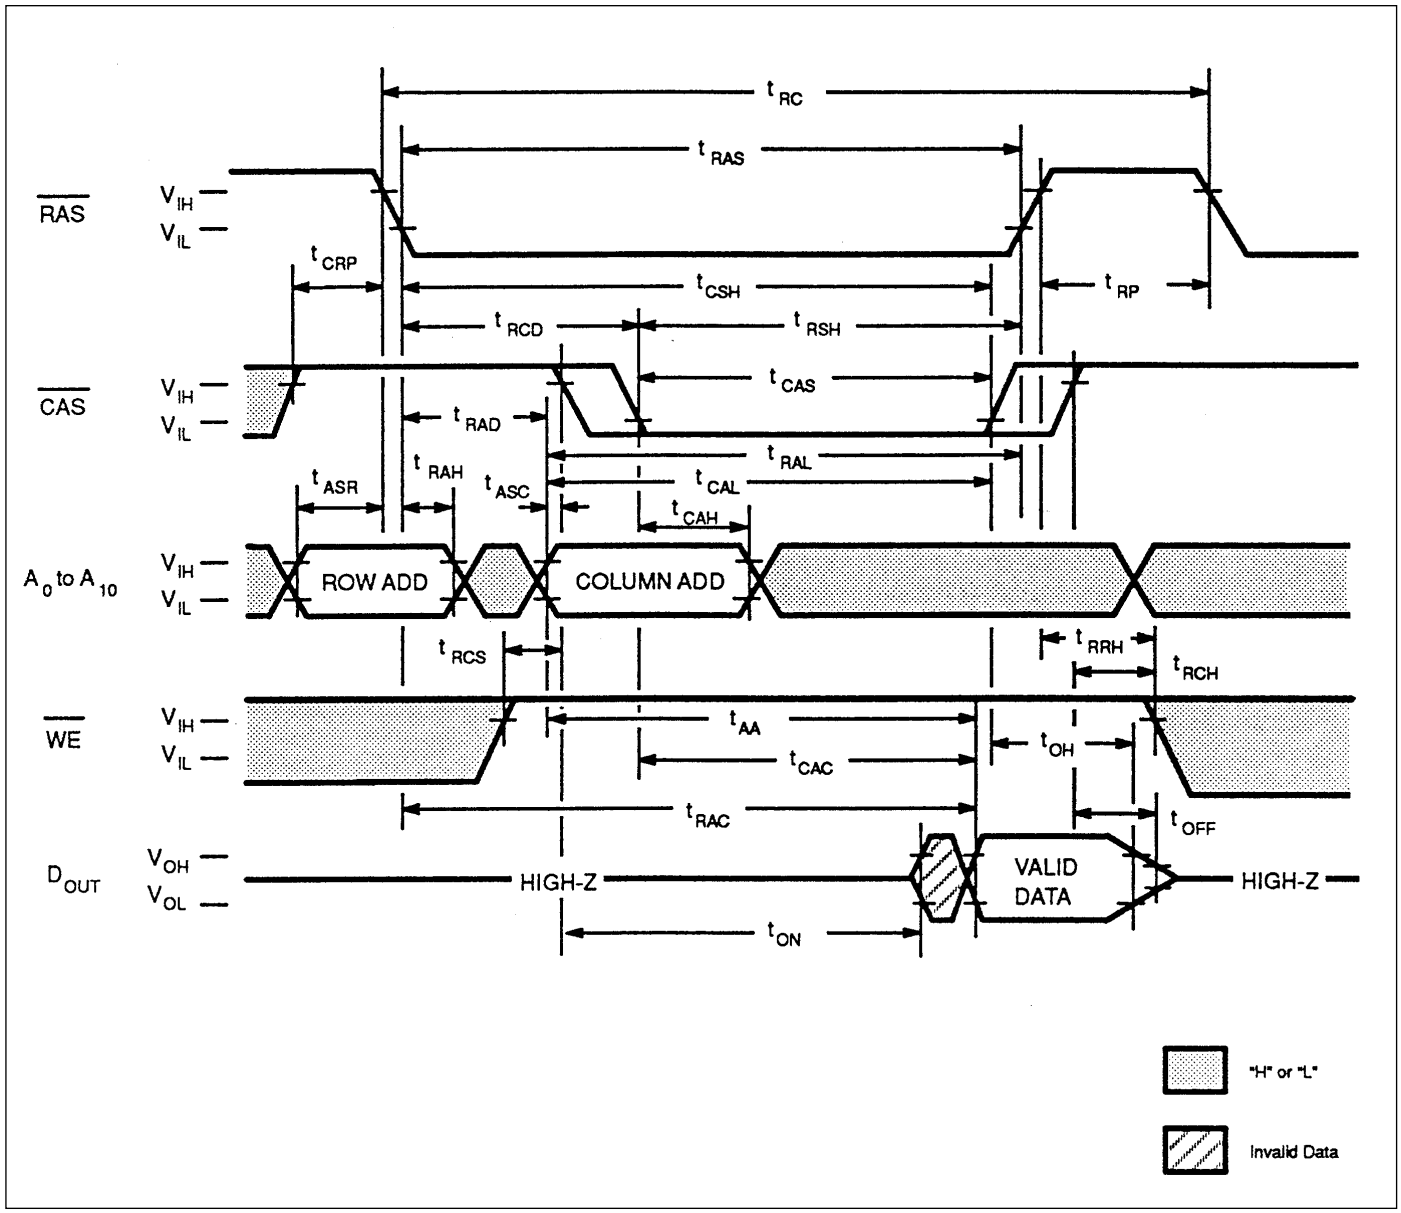

Figure 5. Read Cycle

DESCRIPTION

The read cycle is executed by keeping both $\overline{RAS}$ and $\overline{CAS}$ "L" and keeping $\overline{WE}$ "H" throughout the cycle. The row and column addresses are latched with $\overline{RAS}$ and $\overline{CAS}$, respectively. The data output remains valid with $\overline{CAS}$ "L", i.e., if $\overline{CAS}$ goes "H", the data becomes invalid after t_{OH} is satisfied. The access time is determined by $\overline{RAS}$ (t_{RAC}), $\overline{CAS}$ (t_{CAC}), or Column address input (t_{AA}). If t_{RCD} ($\overline{RAS}$ to $\overline{CAS}$ delay time) is greater than the specification, the access time is t_{AA}.

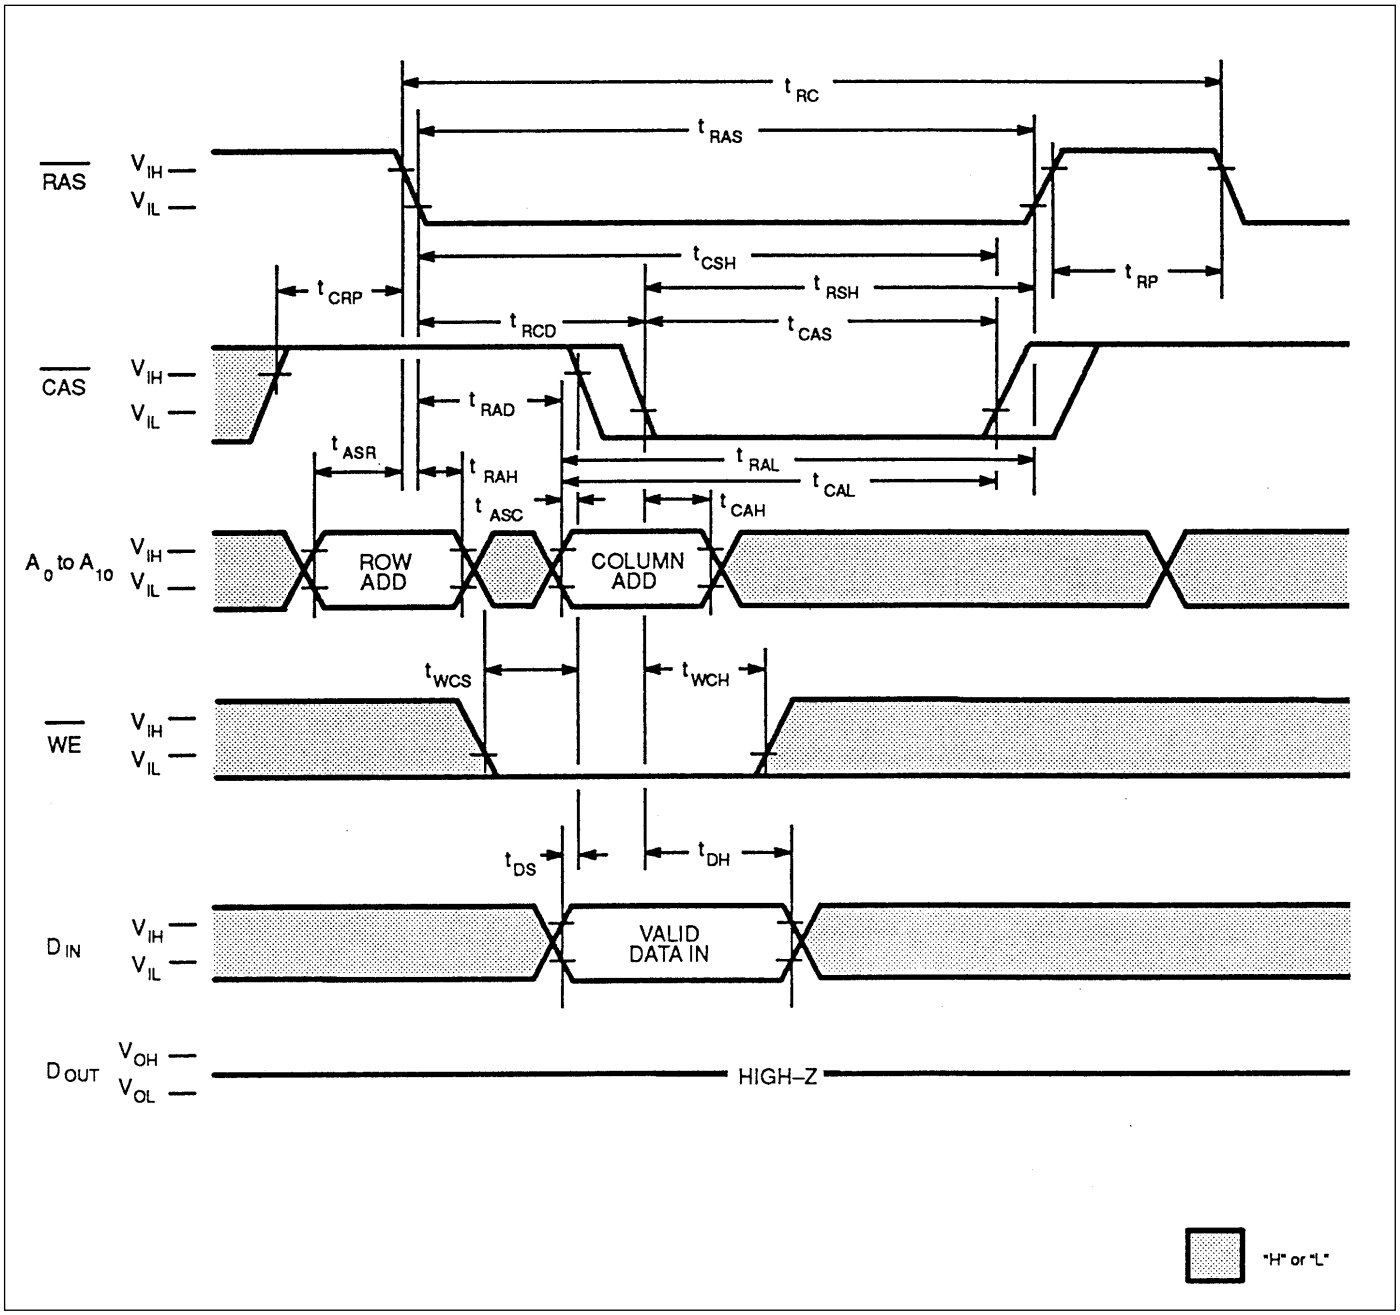

Figure 6. Write Cycle (Early Write)

DESCRIPTION

The write cycle is executed by the same manner as read cycle except for the state of $\overline{WE}$ and DIN pins. The data on DIN pin is latched with the later falling edge of $\overline{CAS}$ or $\overline{WE}$ and written into memory. In addition, during write cycle, t_{RWL} and t_{RAL} must be satisfied with the specifications.

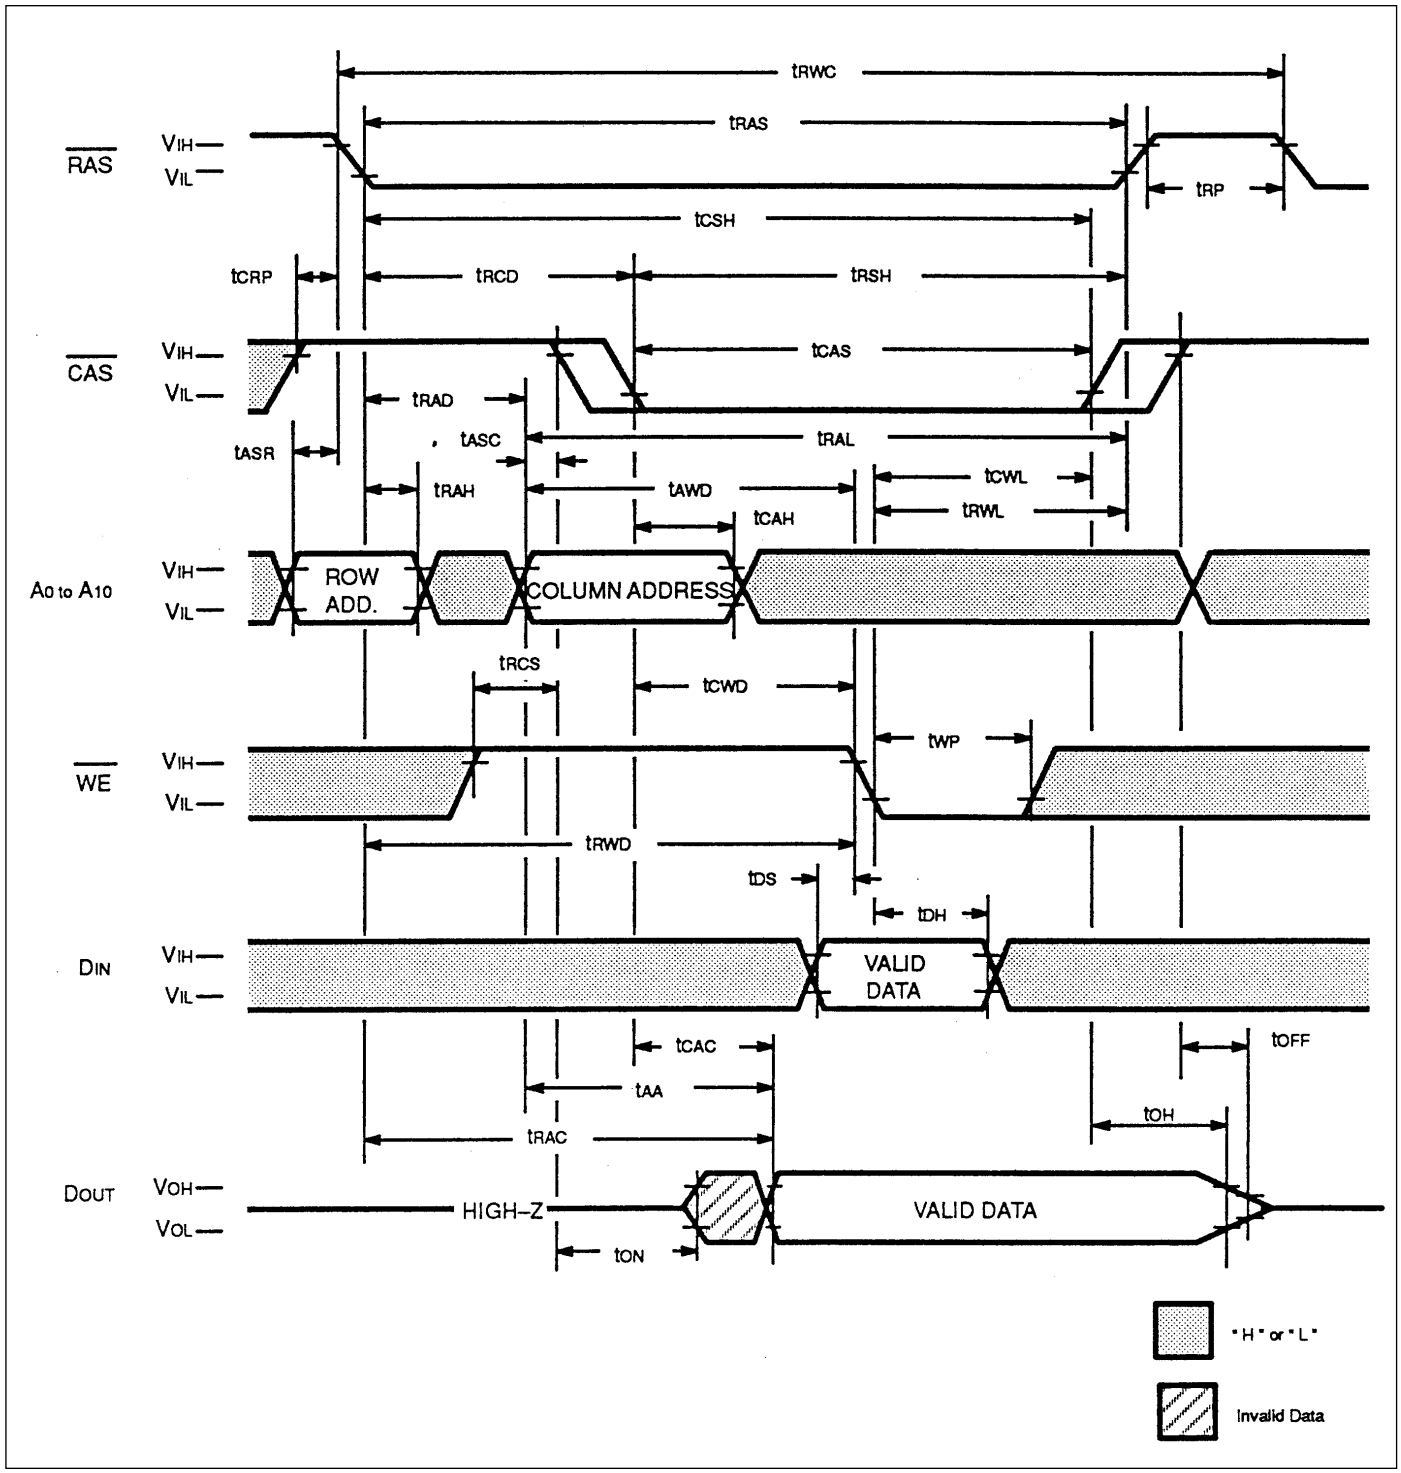

Figure 7. Read Write/Read-Modify-Write Cycle

DESCRIPTION

The read-modify-write cycle is executed by changing $\overline{WE}$ from “H” to “L” after the data appears on the D_{OUT} pin. After the current data is readout, modified data can be rewritten into the same address quickly.

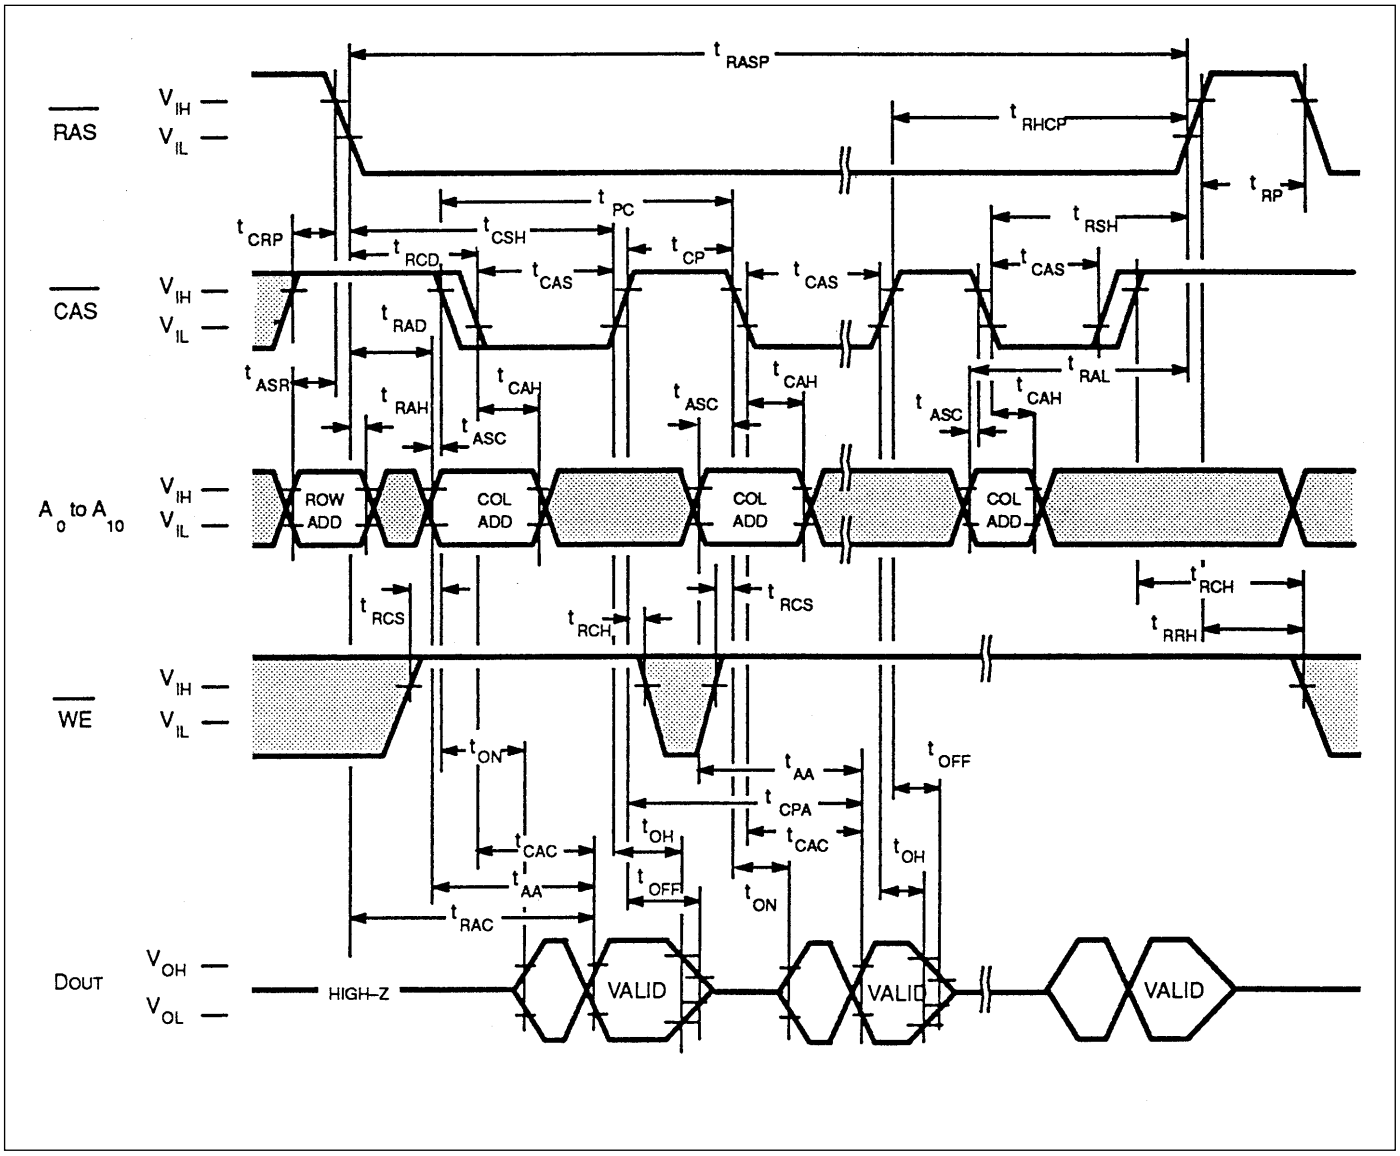

FIgure 8. Fast Page Mode Read Cycle

DESCRIPTION

The fast page mode read cycle is executed after normal cycle with holding $\overline{RAS}$ "L", applying column address and $\overline{CAS}$, and keeping $\overline{WE}$ "H". Once an address is selected normally using the $\overline{RAS}$ and $\overline{CAS}$, other addresses in the same row can be selected by only changing the column address and applying the $\overline{CAS}$. During fast page mode, the access time is t_{CAC}, t_{AA}, or t_{CPA}, whichever occurs later. Any of the 2048 bits belonging to each row can be accessed.

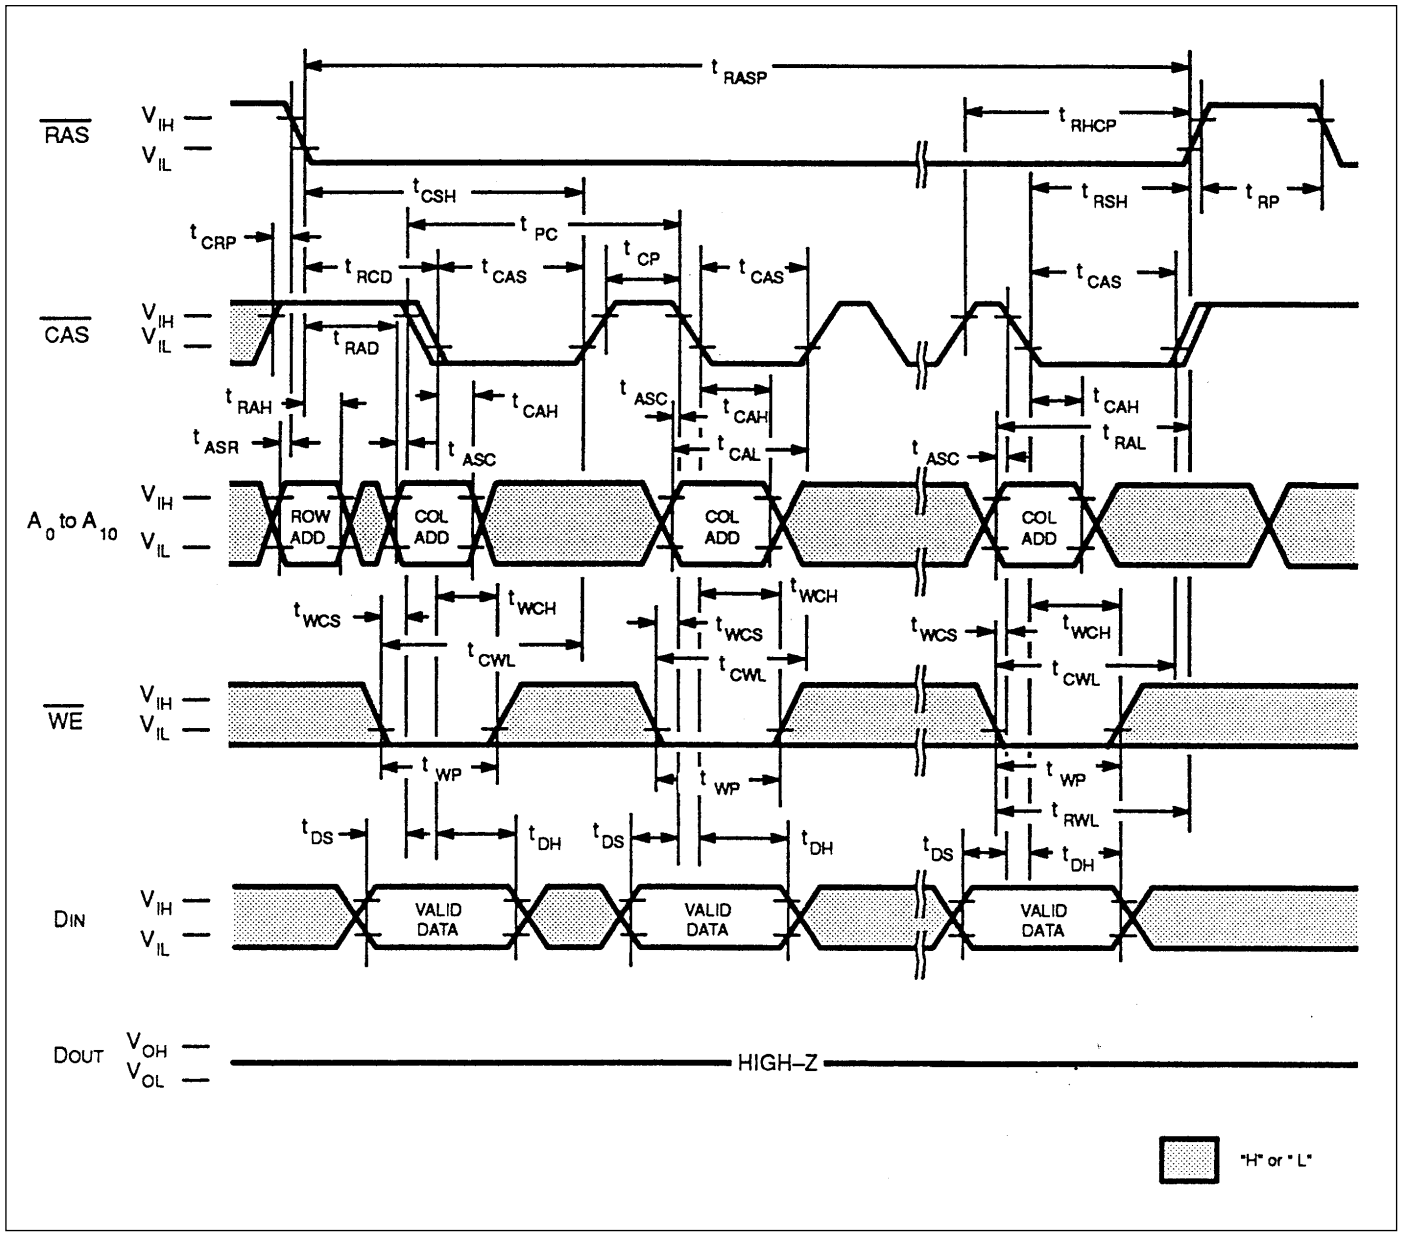

Figure 9. Fast Page Mode Write Cycle (Early Write)

DESCRIPTION

The fast page mode write cycle is executed by the same manner as fast page mode read cycle except for the state of $\overline{WE}$. The data on DIN pin is latched with the falling edge of $\overline{CAS}$ and written into the memory. During fast page mode write cycle, t_{CWL} must be satisfied. Any of the 2048 bits belonging to each row can be accessed.

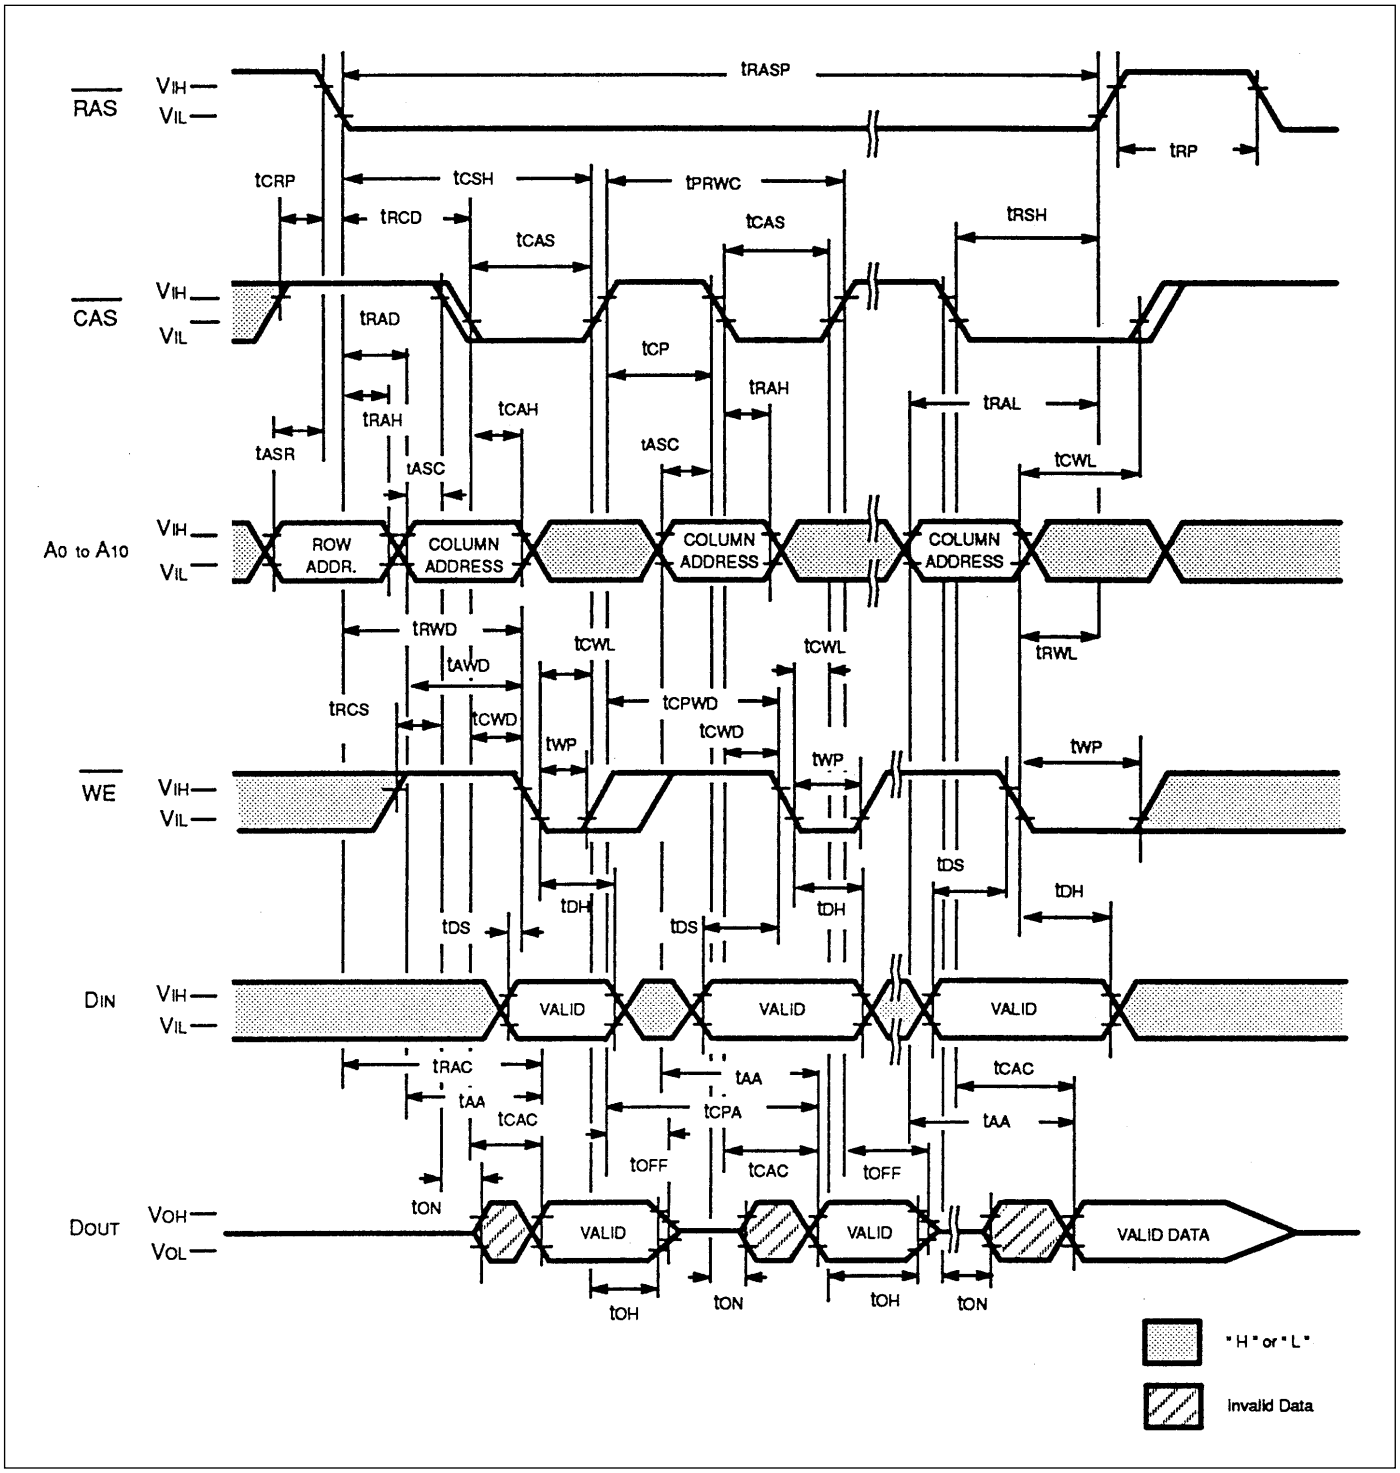

FIgure 10. Fast Page Mode Read-Modify-Write Cycle

DESCRIPTION

During fast page mode, the read-modify-write cycle can be executed by changing $\overline{WE}$ high to low after the data appears at D_{OUT} pin as well as normal cycle. Any of the 2048 bits belonging to each row can be accessed.

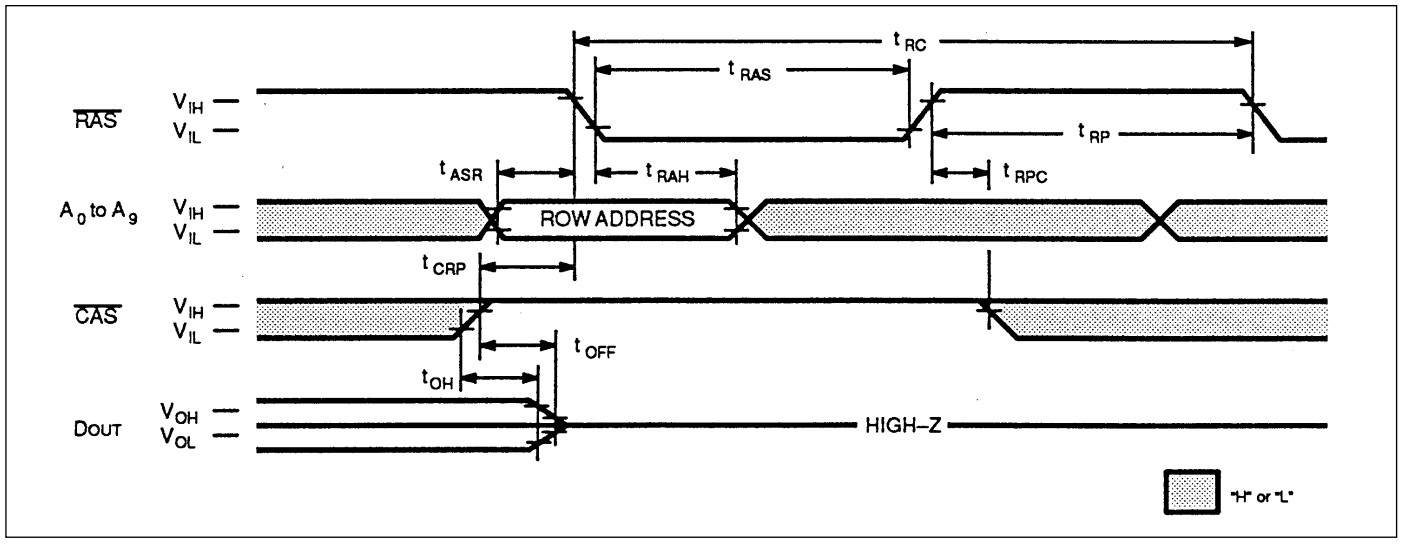

Figure 11. $\overline{RAS}$-Only Refresh ($\overline{WE}$, DIN, A10 = "H" or "L")

DESCRIPTION

The refresh of DRAM is executed by normal read, write or read-modify-write cycle, i.e., the cells on the one row line are also refreshed by executing one of three cycles. 1024 row address must be refreshed every 16.4ms period. During the refresh cycle, the cell data connected to the selected row are sent to sense amplifier and rewritten to the cell. The MB814100A has three types of refresh modes, $\overline{RAS}$-only refresh, $\overline{CAS}$-before-$\overline{RAS}$ refresh, and Hidden refresh.

The $\overline{RAS}$ only refresh is executed by keeping $\overline{RAS}$ "L" and $\overline{CAS}$ "H" throughout the cycle. The row address to be refreshed is latched on the falling edge of $\overline{RAS}$. During $\overline{RAS}$ only refresh, the D_{OUT} pin is kept in a high impedance state.

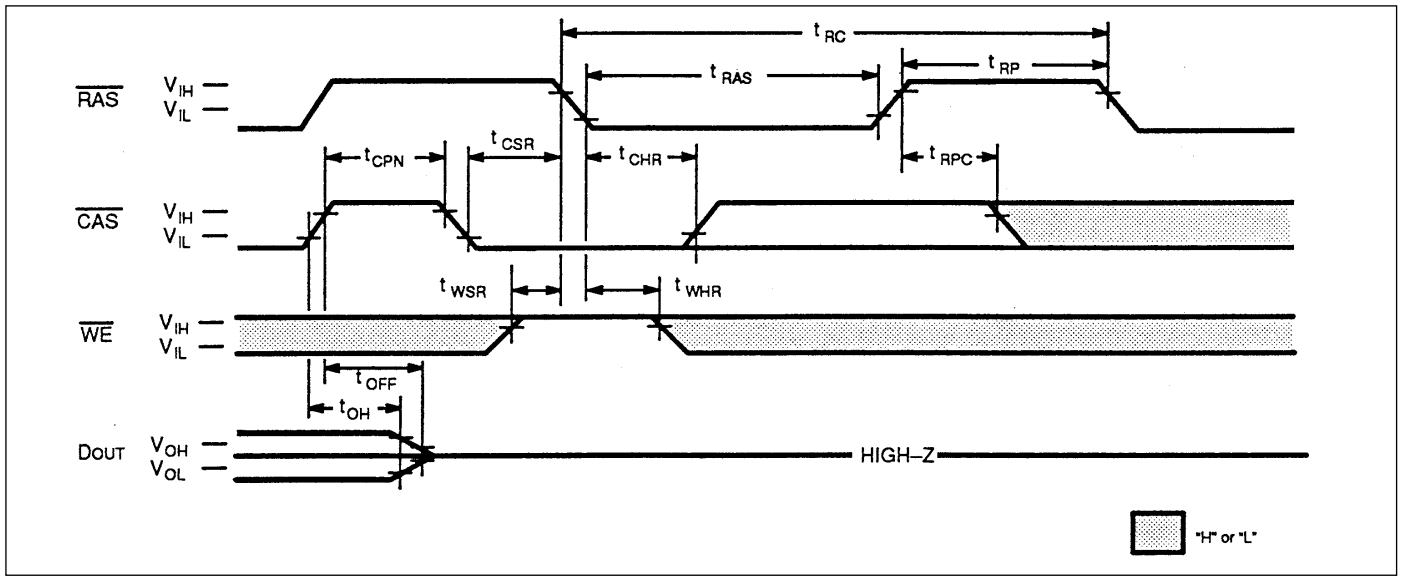

Figure 12. $\overline{CAS}$-Before-$\overline{RAS}$ Refresh (A0 to A10, DIN = "H" or "L")

DESCRIPTION

The $\overline{CAS}$-before-$\overline{RAS}$ refresh is executed by bringing $\overline{CAS}$ "L" before $\overline{RAS}$. By this timing combination, the MB814100A executes $\overline{CAS}$-before-$\overline{RAS}$ refresh. The row address input is not necessary because it is generated internally.

$\overline{WE}$ must be held "H" for the specified set up time (t_{WSR}) before $\overline{RAS}$ goes "L" in order not to enter "test mode".

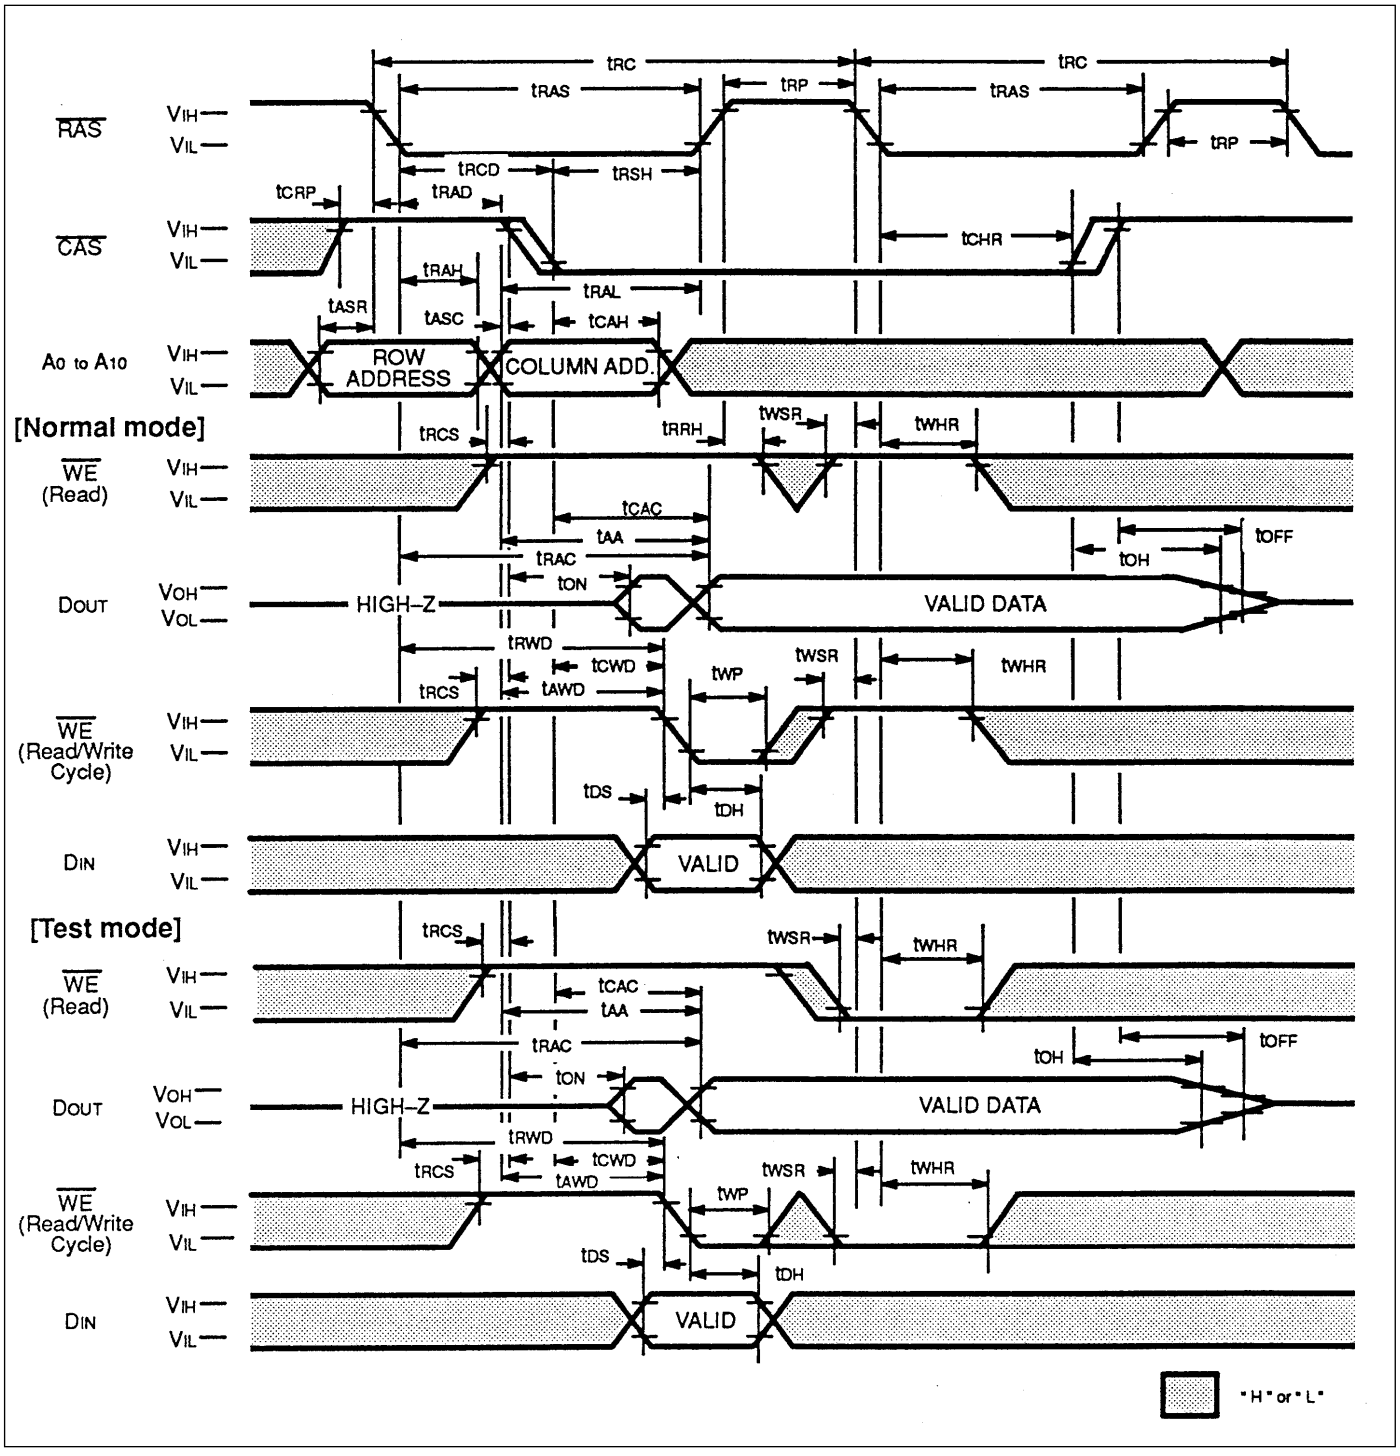

Figure 13. Hidden Refresh Cycle

DESCRIPTION

The hidden refresh is executed by keeping $\overline{CAS}$ "L" to next cycle, i.e., the output data at previous cycle is kept during next refresh cycle. Since the $\overline{CAS}$ is kept low continuously from previous cycle, followed refresh cycle should be $\overline{CAS}$-before-$\overline{RAS}$ refresh. $\overline{WE}$ must be held "H" for the specified set up time (t_{WSR}) before $\overline{RAS}$ goes "L" for the second time in order not to enter "test mode" to be specified later.

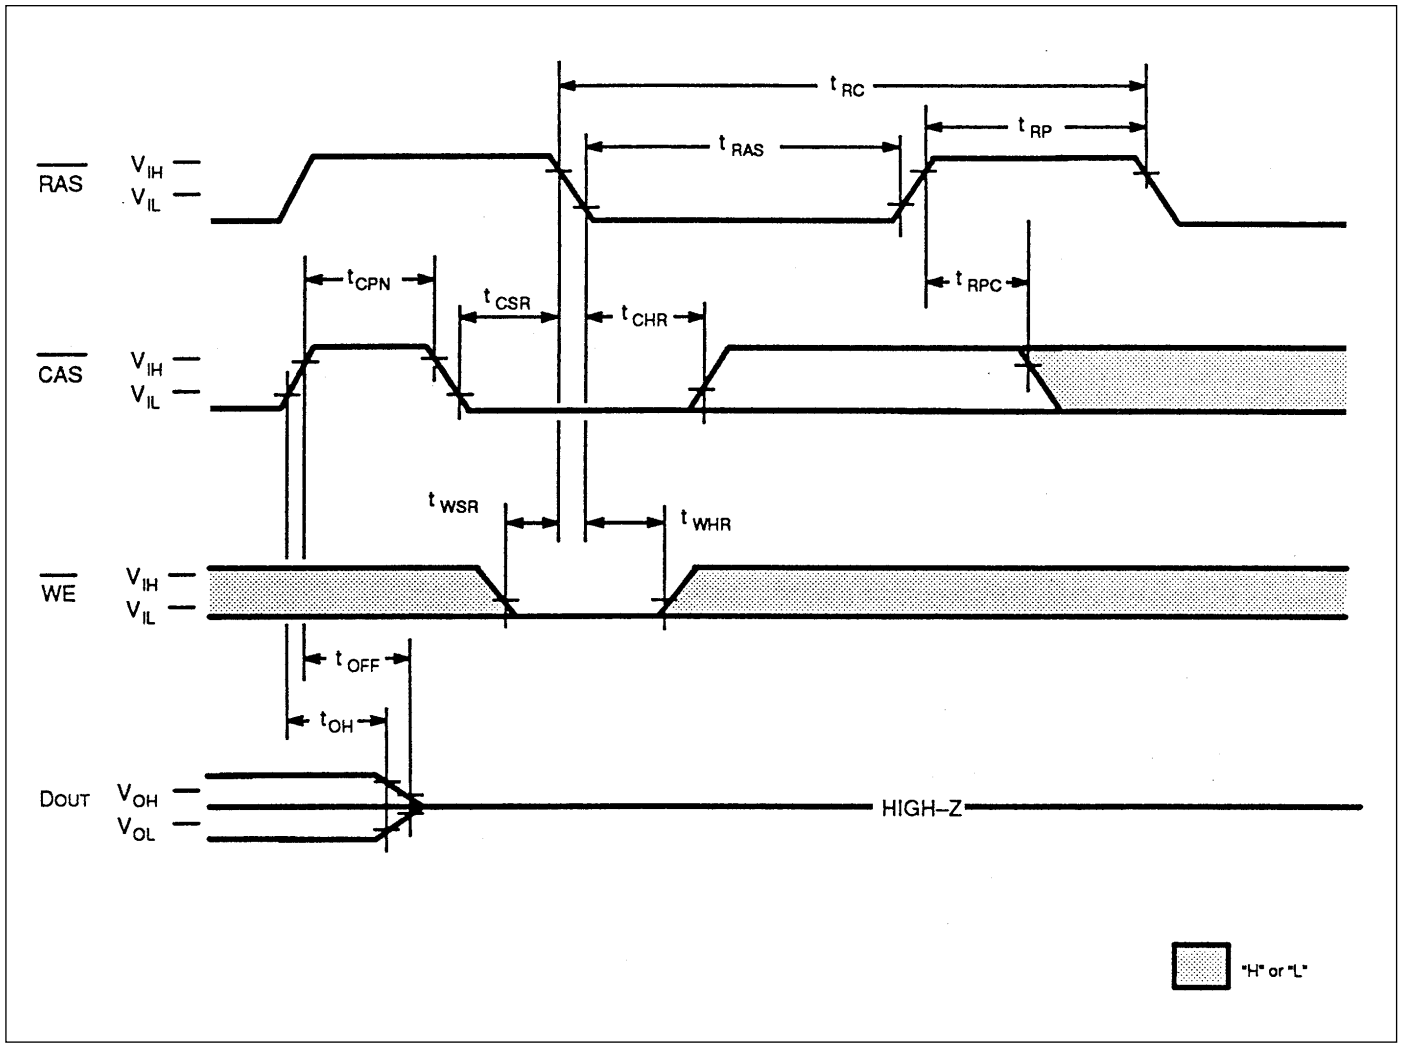

Figure 14. Test Mode Set Cycle (A0 to A10, DIN = “H” or “L”)

DESCRIPTION

Test Mode

The purpose of this test mode is to reduce device test time to one eighth of that required to test the device conventionally. The test mode function is entered by performing a $\overline{WE}$ and $\overline{CAS}$-before-$\overline{RAS}$ (WCBR) refresh for the entry cycle. In the test mode, read and write operations are executed in units of eights bits which are selected by the address combination of RA10, CA0 and CA10. In the write mode, data at DIN is written into eight cells simultaneously. In the read mode, eight cells at the selected addresses are read back and checked in the following manner.

When the eight bits are all “L” or all “H”, a “H” level is output.

When the eight bits show a combination of “L” and “H”, a “L” level is output.

The test mode function is exited by performing a $\overline{RAS}$-only refresh or a $\overline{CAS}$-before-$\overline{RAS}$ refresh for the exit cycle. In test mode operation, the following parameters are delayed approximately 5ns from the specified value in the data sheet.

tRC, tRWC, tRAC, tAA, tRAS, tCSH, tRAL, tRWD, tAWD, tC, tPRWC, tCPA, tRHCP, tCPWD

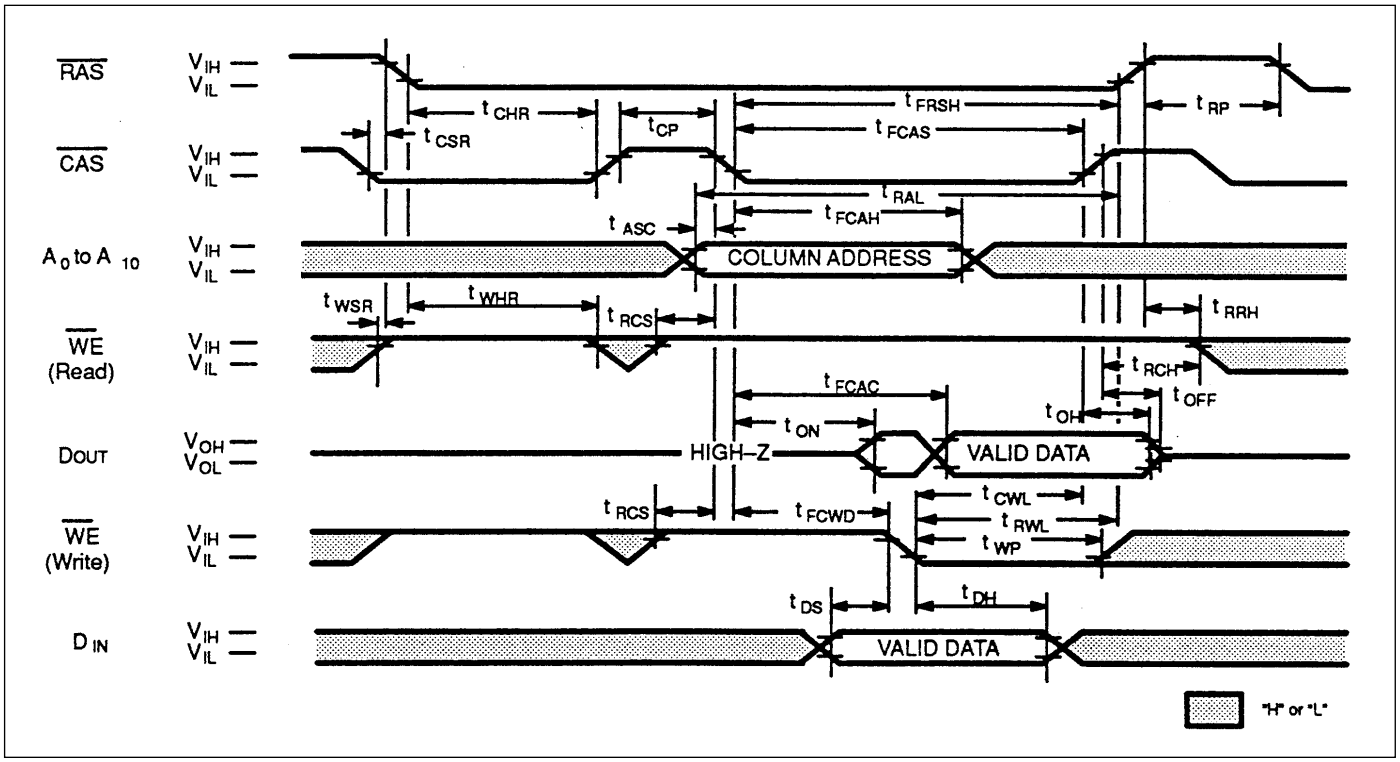

Figure 15. $\overline{CAS}$-before-$\overline{RAS}$ Refresh Counter Test Cycle

DESCRIPTION

A special timing sequence using the $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test cycle provides a convenient method to verify the functionality of $\overline{CAS}$-before-$\overline{RAS}$ refresh circuitry. If, after a $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle, $\overline{CAS}$ makes a transition from High to Low while $\overline{RAS}$ is held Low, read and write operations are enabled as shown above. Row and column addresses are defined as follows:

Row Address: Bits A0 through A10 are defined by the on-chip refresh counter.
Column Address: Bits A0 through A10 are defined by latching levels on A0-A9 at the second falling edge of $\overline{CAS}$.

The $\overline{CAS}$-before-$\overline{RAS}$ Counter Test procedure is as follows:

1. Initialize the internal refresh address counter by using 8 $\overline{RAS}$ only refresh cycles.
2. Use the same column address throughout the test.
3. Write “0” to all 1024 row addresses at the same column address by using normal write cycles.
4. Read “0” written in procedure 3 and check, simultaneously write “1” to the same addresses by using $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test (read-modify-write cycles). Repeat this procedure 1024 times with addresses generated by the internal refresh address counter.
5. Read and check data written in procedure 4 by using normal read cycle for all 1024 memory locations.
6. Reverse test data and repeat procedures 3, 4, and 5.

(At recommended operating conditions unless otherwise noted)

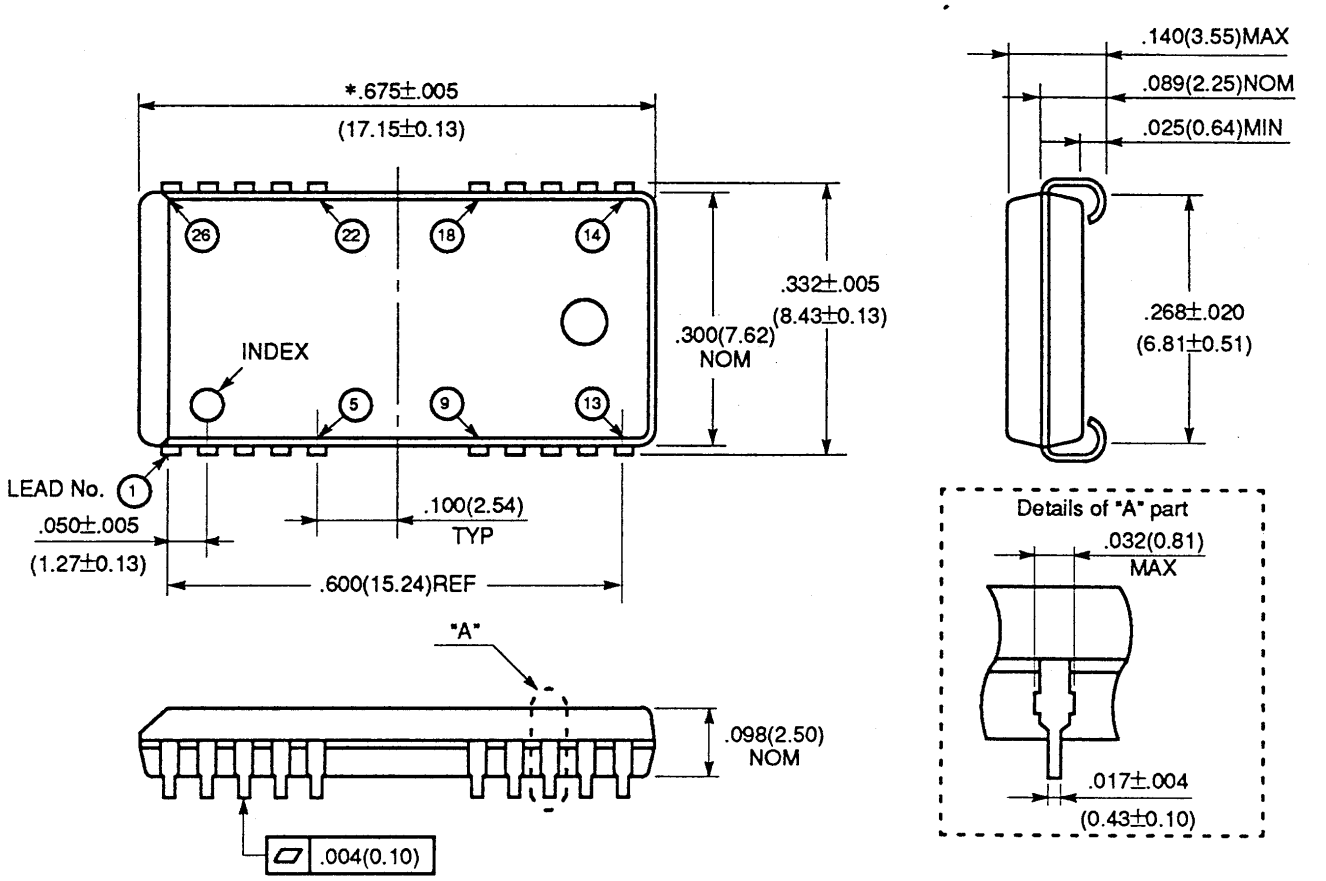
No.	Parameter	Symbol	MB814100A-60		MB814100A-70		MB814100A-80		Unit
			Min	Max	Min	Max	Min	Max	
90	Access Time from $\overline{CAS}$	t_{FCAC}	—	50	—	55	—	60	ns
91	Column Address Hold Time	t_{FCAH}	30	—	30	—	35	—	ns
92	$\overline{CAS}$ to $\overline{WE}$ Delay Time	t_{FCWD}	50	—	55	—	60	—	ns
93	$\overline{CAS}$ Pulse Width	t_{FCAS}	50	—	55	—	60	—	ns
94	$\overline{RAS}$ Hold Time	t_{FRSH}	50	—	55	—	60	—	ns

Note: Assumes that $\overline{CAS}$-before-$\overline{RAS}$ refresh counter test cycle only.

PACKAGE DIMENSIONS

(Suffix: -PJN)

26-LEAD PLASTIC LEADED CHIP CARRIER
(CASE No.: LCC-26P-M04)

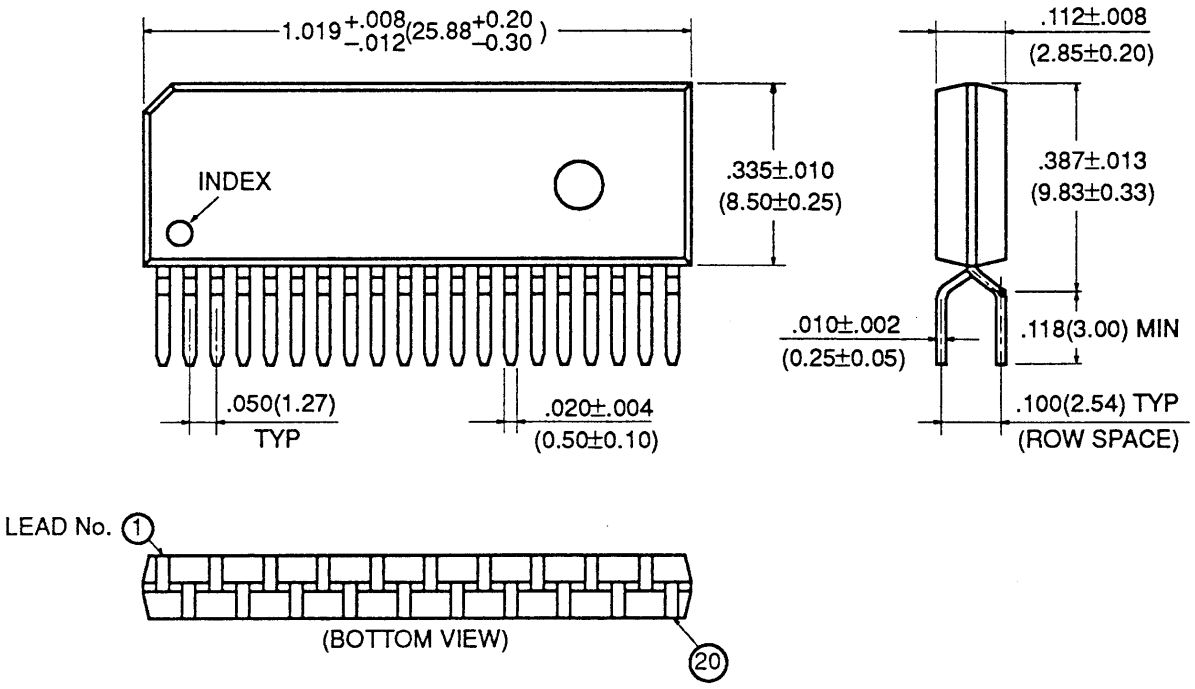


Note: 1. *:Resin protrusion. (Each side:.006(0.15)MAX)
2. Although this package has 20 leads only, its pin positions are the same as that of 26-lead package.
3. Dimensions in inches (millimeters)

PACKAGE DIMENSIONS (Continued)

(Suffix: -PZ)

20-LEAD PLASTIC ZIG-ZAG IN-LINE PACKAGE
(CASE No.: ZIP-20P-M02)

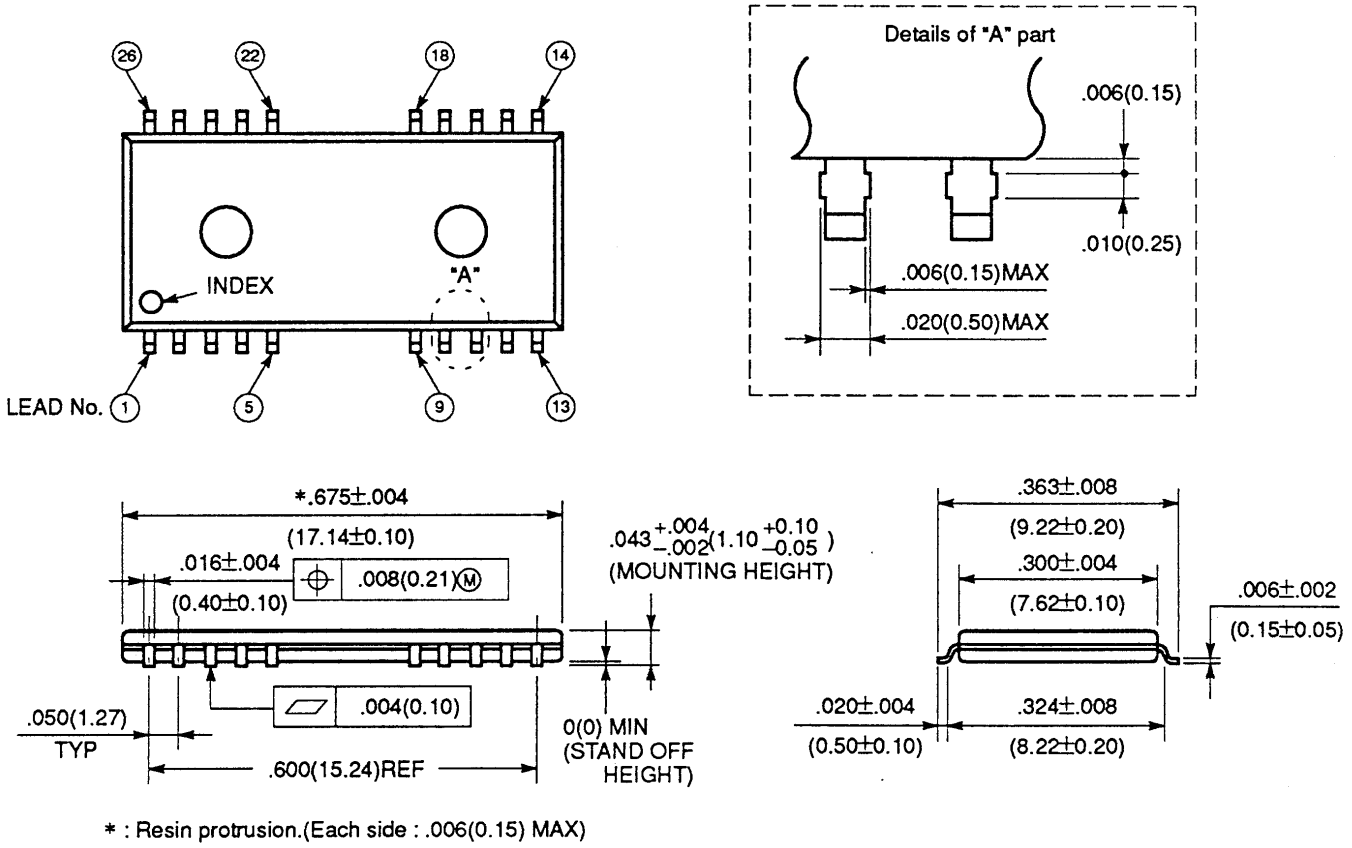


Dimensions in
inches (millimeters)

PACKAGE DIMENSIONS (Continued)

(Suffix: -PFTN)

26-LEAD PLASTIC FLAT PACKAGE
(CASE No.: FPT-26P-M01)



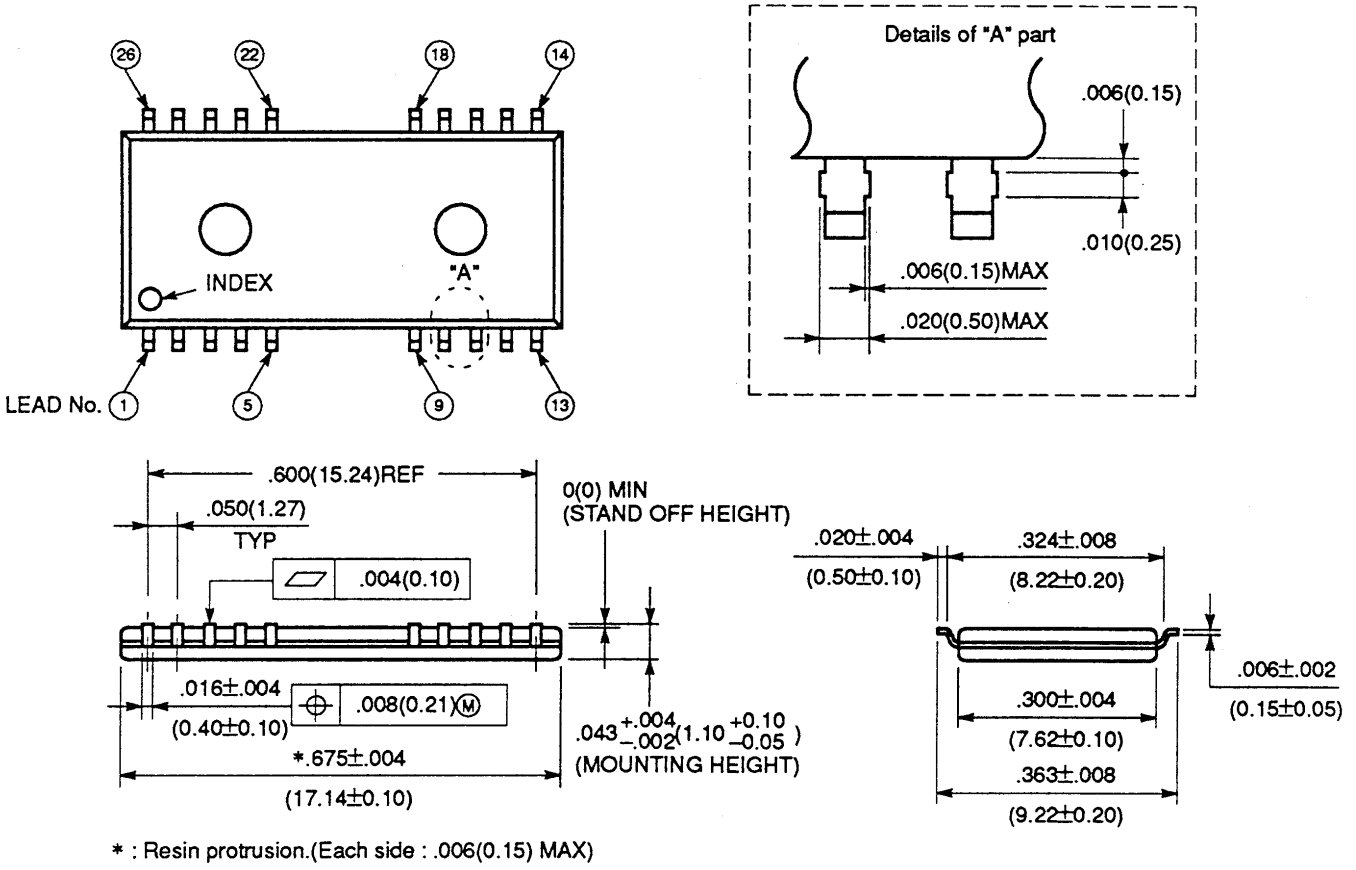
* : Resin protrusion.(Each side : .006(0.15) MAX)

Dimensions in
inches (millimeters)

PACKAGE DIMENSIONS (Continued)

(Suffix: -PFTR)

26-LEAD PLASTIC FLAT PACKAGE
(CASE No.: FPT-26P-M02)



* : Resin protrusion.(Each side : .006(0.15) MAX)

Dimensions in
inches (millimeters)
