

MB81C4256A-60/-70/-80/-10

CMOS 256K x 4 BIT FAST PAGE MODE DYNAMIC RAM

The Fujitsu MB81C4256A is a CMOS, fully decoded dynamic RAM organized as 262,144 words x 4 bits. The MB81C4256A has been designed for mainframe memories, buffer memories, video image memories requiring high speed and high-band width output with low power dissipation, as well as for memory systems of handheld computers which need very low power dissipation.

Fujitsu's advanced three-dimensional stacked capacitor cell technology gives the MB81C4256A high α -ray soft error immunity and extended refresh time. CMOS technology is used in the peripheral circuits to provide low power dissipation and high speed operation..

Parameter		MB81C4256A -60	MB81C4256A -70	MB81C4256A -80	MB81C4256A -10
RAS Access Time		60 ns max	70 ns max.	80 ns max.	100 ns
Random Cycle Time		110 ns min.	125 ns min.	140 ns min.	170 ns min.
Address Access Time		30 ns max.	35 ns max.	40 ns max.	50 ns max.
CAS Access Time		15 ns max.	20 ns max.	20 ns max.	25 ns max.
Fast Page Mode Cycle Time		40 ns min.	45 ns min.	45 ns min.	55 ns min.
Low Power Dissipation	Operating Current	407 mW max.	374 mW max.	341 mW max.	297 mW max.
	Standby Current	11 mW max. (TTL level) / 5.5 mW max. (CMOS level)			

- 262,144 words x 4 bits organization
- Silicon gate, CMOS, 3-D stacked capacitor cell
- All inputs and outputs are TTL compatible
- 512 refresh cycles every 8.2 ms
- Early write or $\overline{\text{OE}}$ controlled write capability
- $\overline{\text{RAS}}$ only, $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$, or Hidden Refresh
- Fast page mode, Read-Modify-Write capability
- On-chip substrate bias generator for high performance

Absolute Maximum Ratings

Parameter	Symbol	Ratings	Unit
Voltage at any pin relative to V_{SS}	V_{IN}, V_{OUT}	-1 to +7	V
Voltage of V_{CC} supply relative to V_{SS}	V_{CC}	-1 to +7	V
Power dissipation	PD	1.0	W
Short circuit output current	—	50	mA
Storage temperature	T_{STG}	-55 to +125	°C

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DIP-20P-M03

LCC-26P-M04

ZIP-20P-M02

* FPT-24P-M04

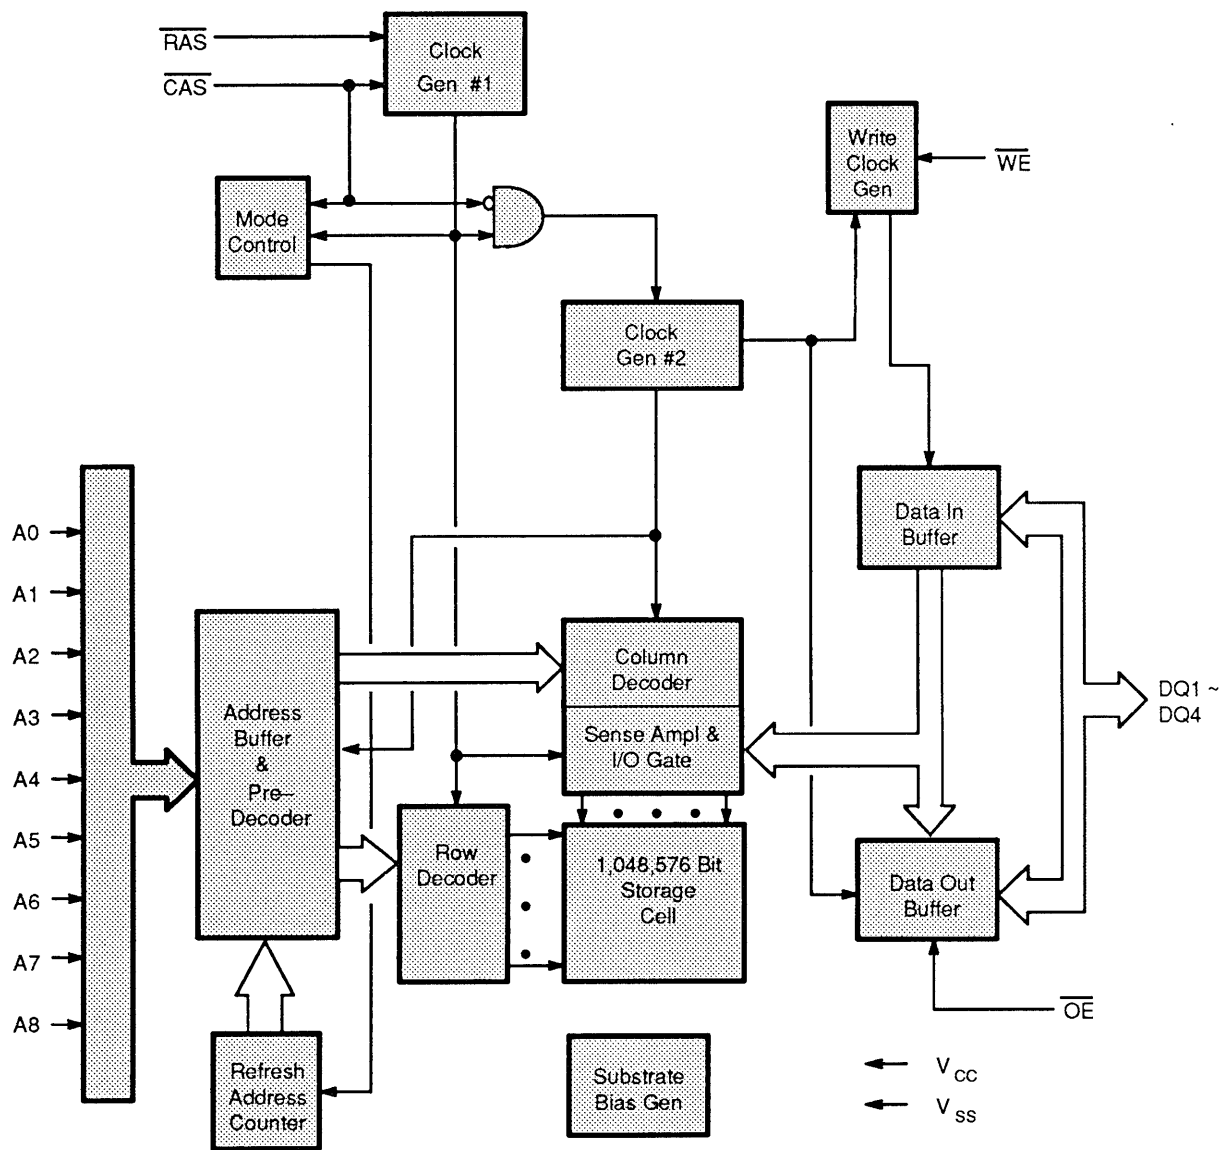

* FPT-24P-M05

* Available for 70/80/100 ns versions

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

RECOMMENDED OPERATING CONDITIONS

Parameter	Notes	Symbol	Min	Typ	Max	Unit	Ambient Operating Temp
Supply Voltage	1	V_{CC}	4.5	5.0	5.5	V	0°C to +70°C
		V_{SS}	0	0	0		
Input High Voltage, all inputs	1	V_{IH}	2.4	—	6.5	V	
Input Low Voltage, all inputs	1	V_{IL}	-2.0	—	0.8	V	
Input Low Voltage, DQ(*)	1	V_{ILD}	-1.0	—	0.8	V	

Note: *: Undershoots of up to -2.0 volts with a pulse width not exceeding 20 ns are acceptable.

FUNCTIONAL OPERATION

ADDRESS INPUTS

Eighteen input bits are required to decode any four of 1,048,576 cell addresses in the memory matrix. Since only nine address bits are available, the column and row inputs are separately strobed by \overline{CAS} and \overline{RAS} as shown in Figure 1. First, nine row address bits are input on pins A0-through-A8 and latched with the row address strobe (\overline{RAS}) then, nine column address bits are input and latched with the column address strobe (\overline{CAS}). Both row and column addresses must be stable on or before the falling edge of \overline{CAS} and \overline{RAS} respectively. The address latches are of the flow-through type; thus, address information appearing after $t_{RAH}(\text{min}) + t_T$ is automatically treated as the column address.

WRITE ENABLE

The read or write mode is determined by the logic state of \overline{WE} . When \overline{WE} is active Low, a write cycle is initiated; when \overline{WE} is High, a read cycle is selected. During the read mode, input data is ignored.

DATA INPUT

Input data is written into memory in either of three basic ways—an early write cycle, an \overline{OE} (delayed) write cycle, and a read-modify-write cycle. The falling edge of \overline{WE} or \overline{CAS} , whichever is later, serves as the input data-latch strobe. In an early write cycle, the input data (DQ1-DQ4) is strobed by \overline{CAS} and the setup and hold times are referenced to \overline{CAS} because \overline{WE} goes Low before \overline{CAS} . In a delayed write or a read-modify-write cycle, \overline{WE} is set low after \overline{CAS} ; thus, input data is strobed by \overline{WE} , and setup and hold times are referenced to the write-enable signal.

DATA OUTPUT

The three-state buffers are TTL compatible with a fanout of two TTL loads. Polarity of the output data is identical to that of the input; the output buffers remain in the high-impedance state until the column address strobe goes Low. When a read or read-modify-write cycle is executed, valid outputs are obtained under the following conditions:

- t_{RAC} : from the falling edge of \overline{RAS} when $t_{RCD}(\text{max})$ is satisfied.
- t_{CAC} : from the falling edge of \overline{CAS} when t_{RCD} is greater than t_{RCD} , $t_{RAD}(\text{max})$.
- t_{AA} : from column address input when t_{RAD} is greater than $t_{RAD}(\text{max})$.
- t_{OEA} : from the falling edge of \overline{OE} when \overline{OE} is brought Low after t_{RAC} , t_{CAC} , or t_{AA} .

The data remains valid until either \overline{CAS} or \overline{OE} returns to a High logic level. When an early write is executed, the output buffers remain in a high-impedance state during the entire cycle.

DC CHARACTERISTICS

Notes: 1. Referenced to V_{SS} .

- I_{CC} depends on the output load conditions and cycle rates; The specified values are obtained with the output open. I_{CC} depends on the number of address change as $\overline{\text{RAS}} = V_{\text{IL}}$, $\overline{\text{CAS}} = V_{\text{IH}}$. I_{CC1} , I_{CC3} , and I_{CC5} are specified at one time of address change during $\overline{\text{RAS}} = V_{\text{IL}}$ and $\overline{\text{CAS}} = V_{\text{IH}}$. I_{CC4} is specified at one time of address change during $\overline{\text{RAS}} = V_{\text{IL}}$ and $\overline{\text{CAS}} = V_{\text{IH}}$.
- An initial pause ($\overline{\text{RAS}} = \overline{\text{CAS}} = V_{\text{IH}}$) of 200 μs is required after power-up followed by any eight $\overline{\text{RAS}}$ -only cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of eight $\overline{\text{CAS}}$ -before-RAS initialization cycles instead of 8 $\overline{\text{RAS}}$ cycles are required.
- AC characteristics assume $t_{\text{f}} = 5 \text{ ns}$.
- V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} (min) and V_{IL} (max).
- Assumes that $t_{\text{RCD}} \leq t_{\text{RCD}}(\text{max})$, $t_{\text{RAD}} \leq t_{\text{RAD}}(\text{max})$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will be increased by the amount that t_{RCD} exceeds the value shown. Refer to Fig. 2 and 3.
- Assumes that $t_{\text{RCD}} \geq t_{\text{RCD}}(\text{max})$, $t_{\text{RAD}} \geq t_{\text{RAD}}(\text{max})$. If $t_{\text{ASC}} \geq t_{\text{AA}} - t_{\text{CAC}} - t_{\text{f}}$, access time is t_{CAC} .
- If $t_{\text{RAD}} \geq t_{\text{RAD}}(\text{max})$ and $t_{\text{ASC}} < t_{\text{AA}} - t_{\text{CAC}} - t_{\text{f}}$, access time is t_{AA} .
- Measured with a load equivalent to two TTL loads and 100 pF.
- t_{OFF} and t_{OEZ} is specified that output buffer change to high impedance state.
- Operation within the $t_{\text{RCD}}(\text{max})$ limit ensures that $t_{\text{RAC}}(\text{max})$ can be met. $t_{\text{RCD}}(\text{max})$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{\text{RCD}}(\text{max})$ limit, access time is controlled exclusively by t_{CAC} or t_{AA} .
- $t_{\text{RCD}}(\text{min}) = t_{\text{RAH}}(\text{min}) + 2t_{\text{T}} + t_{\text{ASC}}(\text{min})$.
- Operation within the $t_{\text{RAD}}(\text{max})$ limit ensures that $t_{\text{RAC}}(\text{max})$ can be met. $t_{\text{RAD}}(\text{max})$ is specified as a reference point only; if t_{RAD} is greater than the specified $t_{\text{RAD}}(\text{max})$ limit, access time is controlled exclusively by t_{CAC} or t_{AA} .
- Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.
- t_{WCS} is specified as a reference point only. If $t_{\text{WCS}} \geq t_{\text{WCS}}(\text{min})$ the data output pin will remain High-Z state through entire cycle.
- Assumes that $t_{\text{WCS}} < t_{\text{WCS}}(\text{min})$.
- Either t_{DZC} or t_{DZO} must be satisfied.
- t_{CPS} is access time from the selection of a new column address (that is caused by changing $\overline{\text{CAS}}$ from "L" to "H"). Therefore, if t_{CP} is shortened, t_{CPA} is longer than $t_{\text{CPA}}(\text{max})$.
- Assumes that $\overline{\text{CAS}}$ -before-RAS refresh only.

Fig. 2 – t_{RAC} vs. t_{RCD}

Fig. 3 – t_{RAC} vs. t_{RAD}

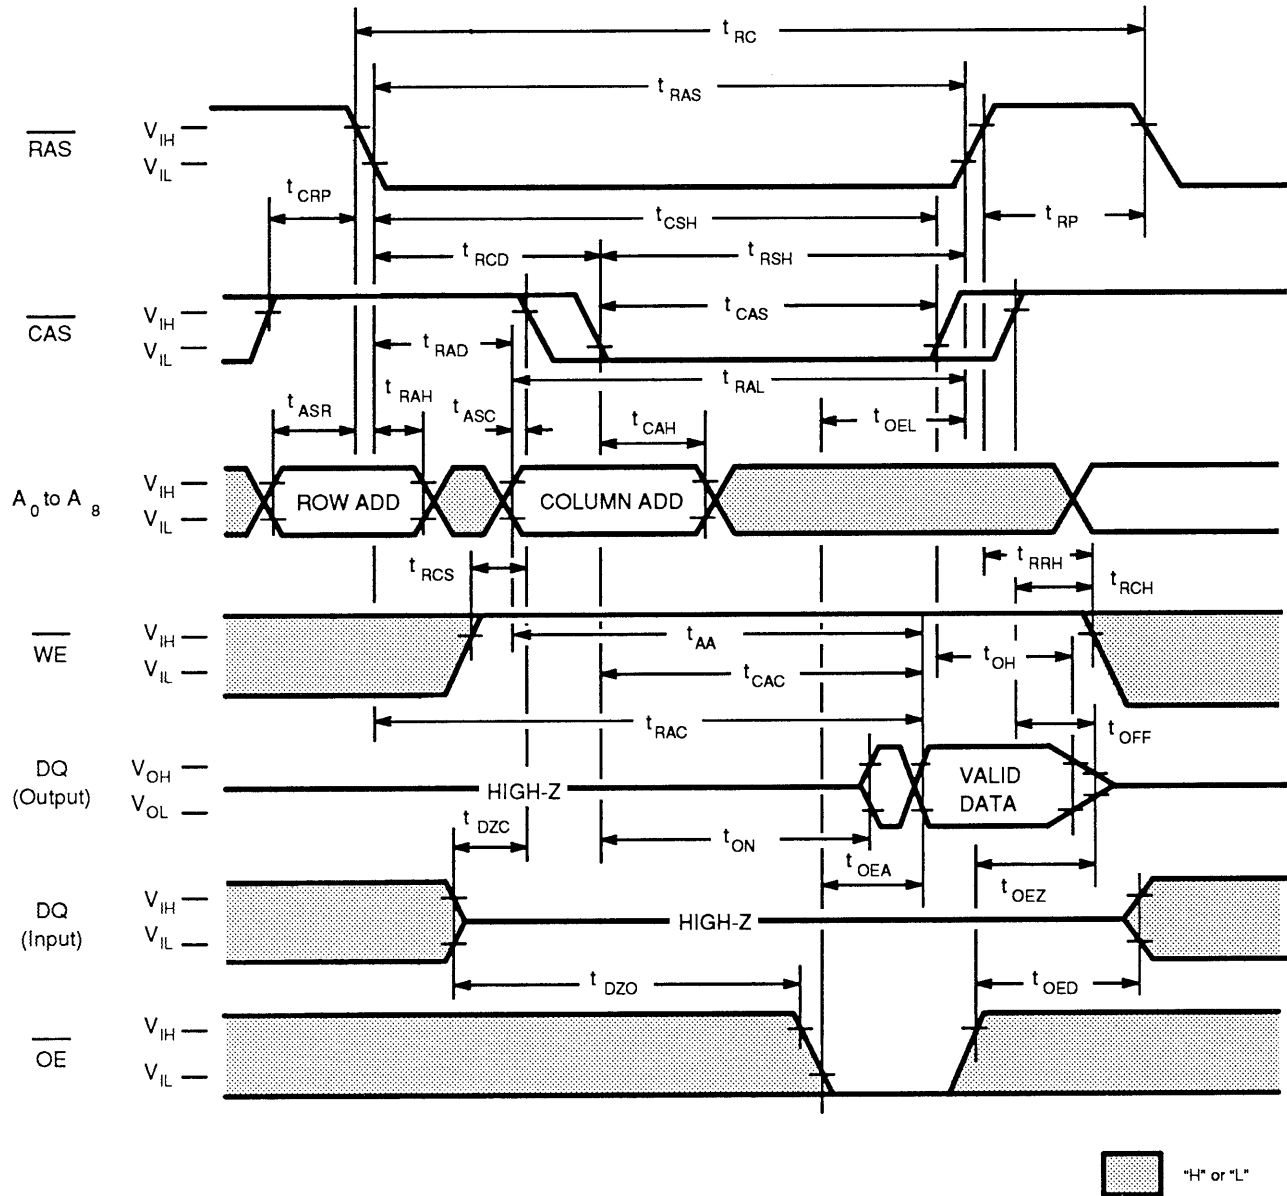

FUNCTIONAL TRUTH TABLE

Operation Mode	Clock Input				Address Input		Data		Refresh	Note
	\overline{RAS}	\overline{CAS}	\overline{WE}	\overline{OE}	Row	Column	Input	Output		
Standby	H	H	X	X	—	—	—	High-Z	—	
Read Cycle	L	L	H	L	Valid	Valid	—	Valid	Yes *	$t_{RCS} \geq t_{RCS}(\text{min})$
Write Cycle (Early Write)	L	L	L	X	Valid	Valid	Valid	High-Z	Yes *	$t_{WCS} \geq t_{WCS}(\text{min})$

Hidden Refresh Cycle	H \rightarrow L	L	X	L	—	—	—	Valid	Yes	Previous data is kept

Notes: X : "H" or "L"

* : It is impossible in Fast Page Mode.

Figure 4. Read Cycle

DESCRIPTION

To implement a read operation, a valid address is latched in by the \overline{RAS} and \overline{CAS} address strobes and with \overline{WE} set to a High level and \overline{OE} set to a low level, the output is valid once the memory access time has elapsed. The access time is determined by $\overline{RAS}(t_{RAC})$, $\overline{CAS}(t_{CAC})$, $\overline{OE}(t_{OEA})$ or column addresses (t_{AA}) under the following conditions:

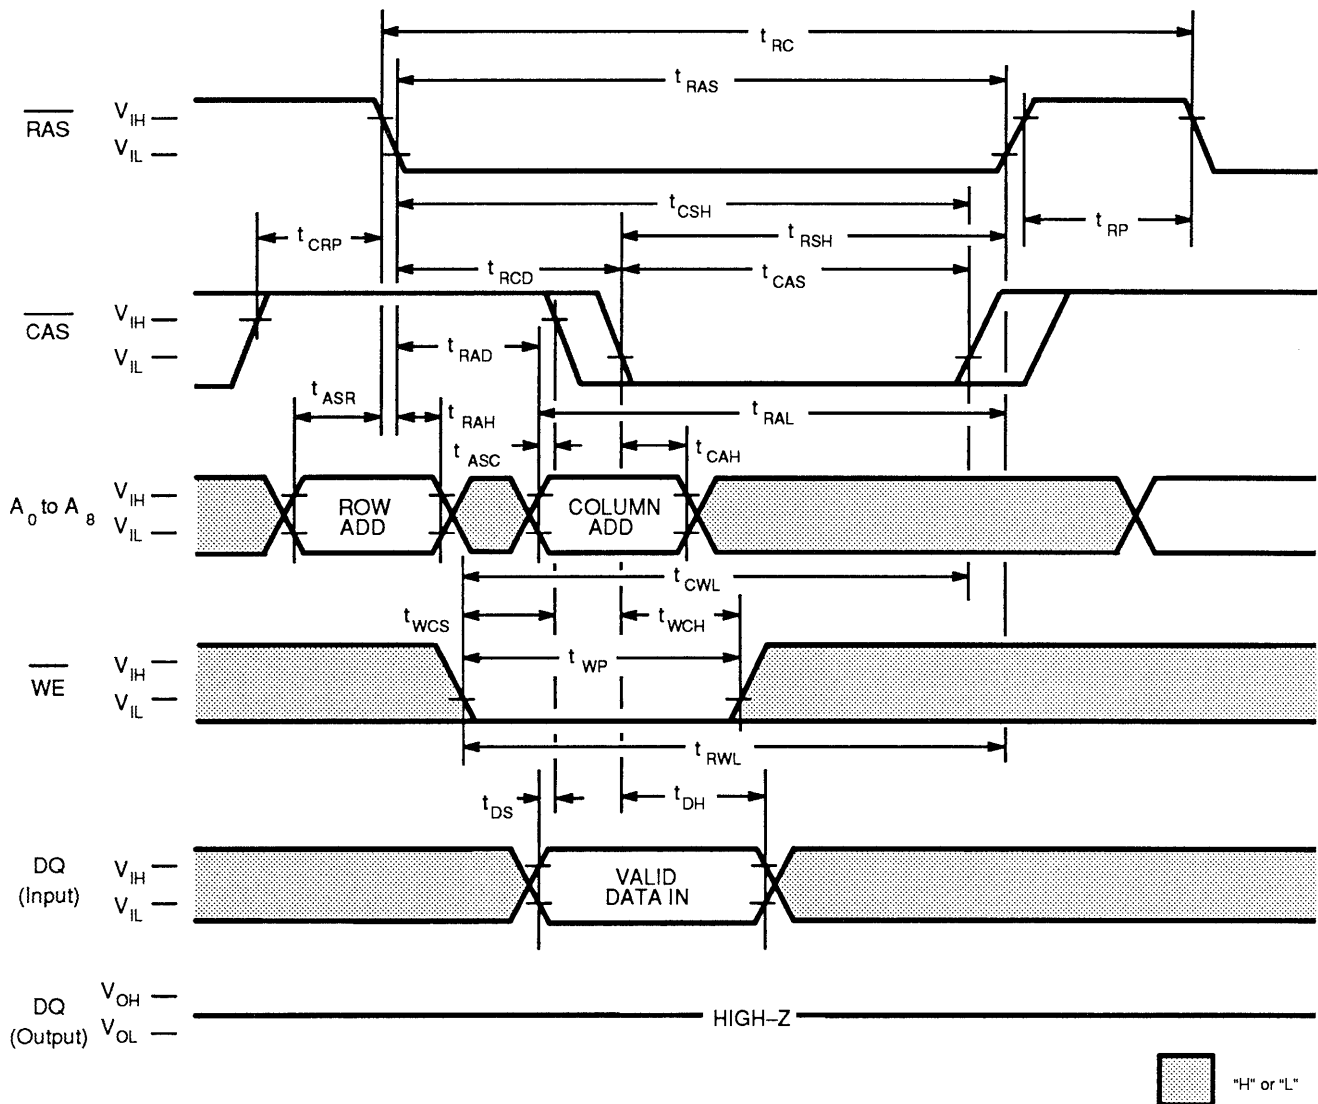

If $t_{RCD} > t_{RCD}(\max)$, access time = t_{CAC} .

If $t_{RAD} > t_{RAD}(\max)$, access time = t_{AA} .

If \overline{OE} is brought Low after t_{RAC} , t_{CAC} , or t_{AA} (which ever occurs later), access time = t_{OEA} .

However, if either \overline{CAS} or \overline{OE} goes High, the output returns to a high-impedance state after t_{OH} is satisfied.

Figure 5. Early Write Cycle ($\overline{\text{OE}}$ = "H" or "L")

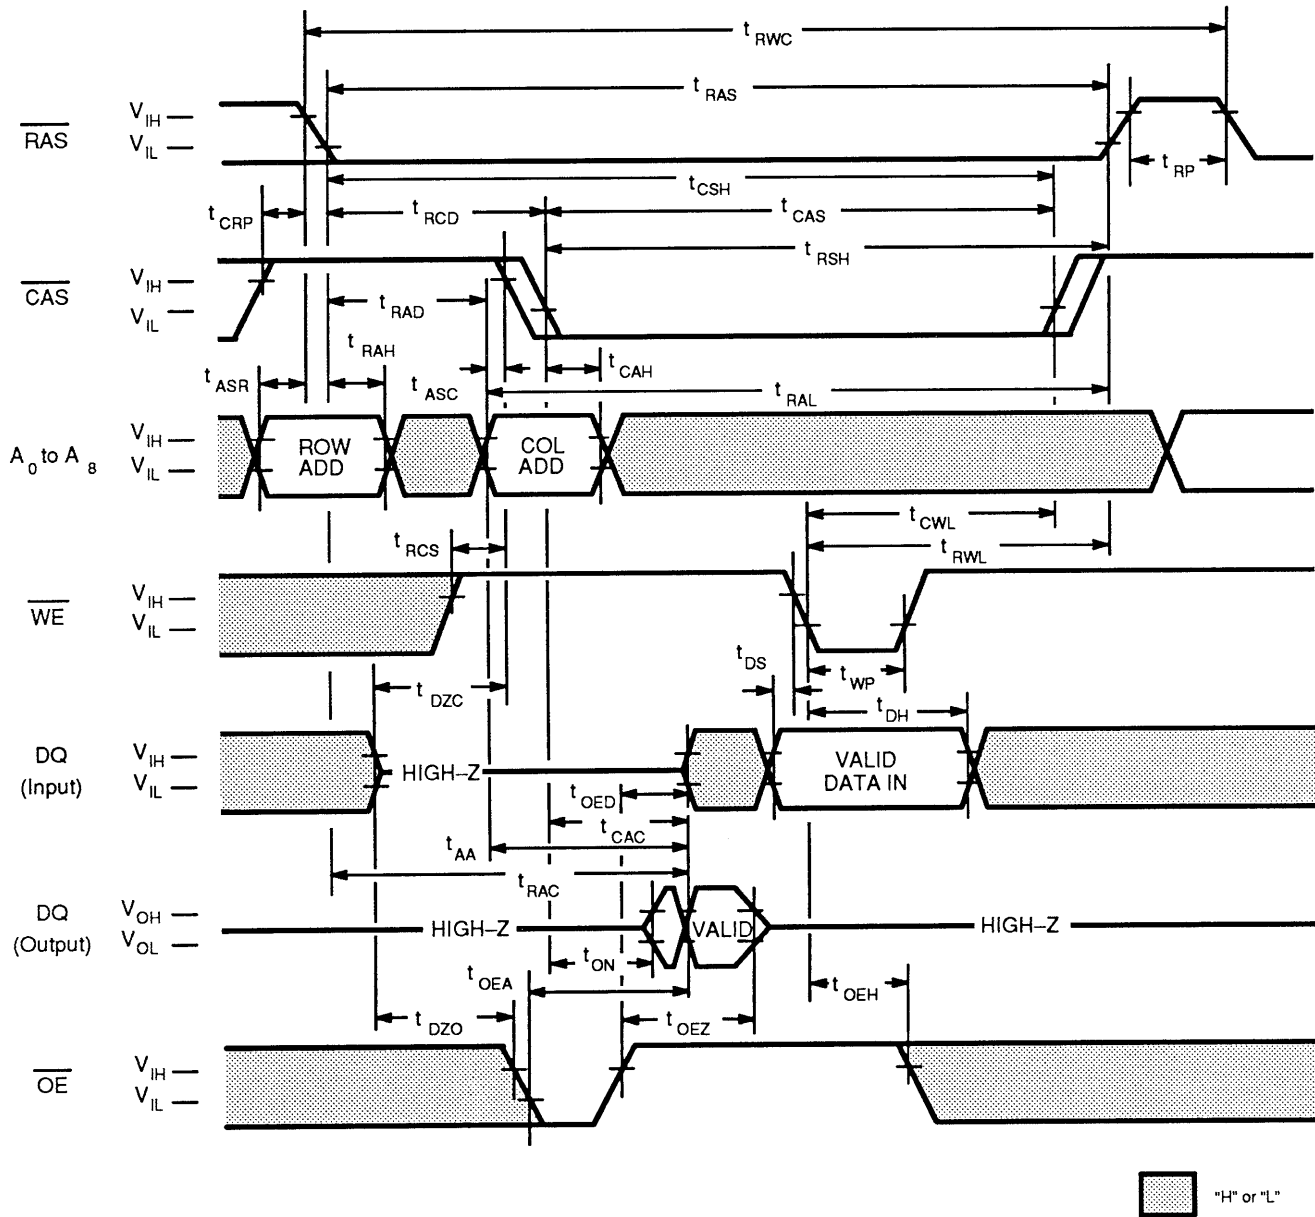

DESCRIPTION

A write cycle is similar to a read cycle except $\overline{\text{WE}}$ is set to a Low state and $\overline{\text{OE}}$ is a "H" or "L" signal. A write cycle can be implemented in either of three ways – early write, $\overline{\text{OE}}$ write (delayed write), or read-modify-write. During all write cycles, timing parameters t_{RWL} , t_{CWL} and t_{RAL} must be satisfied. In the early write cycle shown above t_{WCS} satisfied, data on the DQ pin is latched with the falling edge of $\overline{\text{CAS}}$ and written into memory.

Figure 6. $\overline{\text{OE}}$ (Delayed Write Cycle)**DESCRIPTION**

In the $\overline{\text{OE}}$ (delayed write) cycle, t_{WCS} is not satisfied; thus, the data on the DQ pins is latched with the falling edge of $\overline{\text{WE}}$ and written into memory. The Output Enable ($\overline{\text{OE}}$) signal must be changed from Low to High before $\overline{\text{WE}}$ goes Low ($t_{OED} + t_{DS}$).

Figure 7. Read-Modify-Write Cycle

DESCRIPTION

The read-modify-write cycle is executed by changing \overline{WE} from High to Low after the data appears on the DQ pins. In the read-modify-write cycle, \overline{OE} must be changed from Low to High after the memory access time.

Figure 8. Fast Page Mode Read Cycle

**DESCRIPTION**

The fast page mode of operation permits faster successive memory operations at multiple column locations of the same row address. This operation is performed by strobing in the row address and maintaining $\overline{\text{RAS}}$ at a Low level and $\overline{\text{WE}}$ at a High level during all successive memory cycles in which the row address is latched. The access time is determined by t_{CAC} , t_{AA} , t_{CPA} , or t_{OEA} , whichever one is the latest in occurring.

Figure 9. Fast Page Mode Write Cycle (\overline{OE} = "H" or "L")

DESCRIPTION

The fast page mode write cycle is executed in the same manner as the fastpage mode read cycle except the states of \overline{WE} and \overline{OE} are reversed. Data appearing on the DQ pins is latched on the falling edge of CAS and written into memory. During the fast page mode write cycle, including the delayed (\overline{OE}) write and read-modify-write cycles, t_{CWL} must be satisfied.

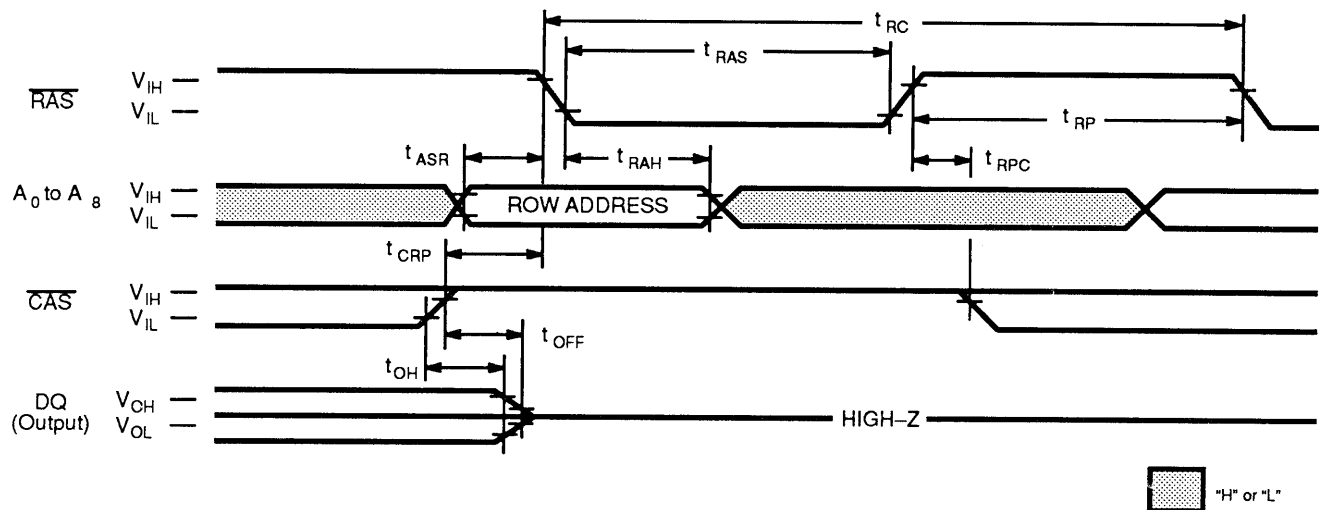

Figure 10. Fast Page Mode $\overline{\text{OE}}$ Write Cycle

DESCRIPTION

The fast page mode $\overline{\text{OE}}$ (delayed) write cycle is executed in the same manner as the fast page mode write cycle except for the states of $\overline{\text{WE}}$ and $\overline{\text{OE}}$. Input data on the DQ pins are latched on the falling edge of $\overline{\text{WE}}$ and written into memory. In the fast page mode delayed write cycle, $\overline{\text{OE}}$ must be changed from Low to High before $\overline{\text{WE}}$ goes Low ($t_{\text{OED}} + t_{\text{DS}}$).

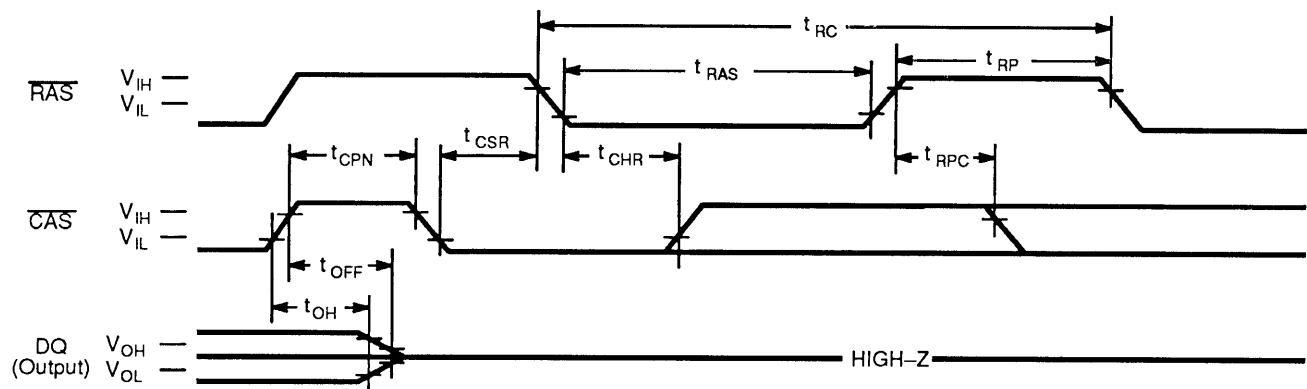

[illegible]

During fast page mode of operation, the read-modify-write cycle can be executed by switching $\overline{\text{WE}}$ from High to Low after input data appears at the DQ pins during a normal cycle.

Figure 12. $\overline{\text{RAS}}$ -Only Refresh Cycle ($\overline{\text{WE}} = \overline{\text{OE}} = \text{"H" or "L"}$)**DESCRIPTION**

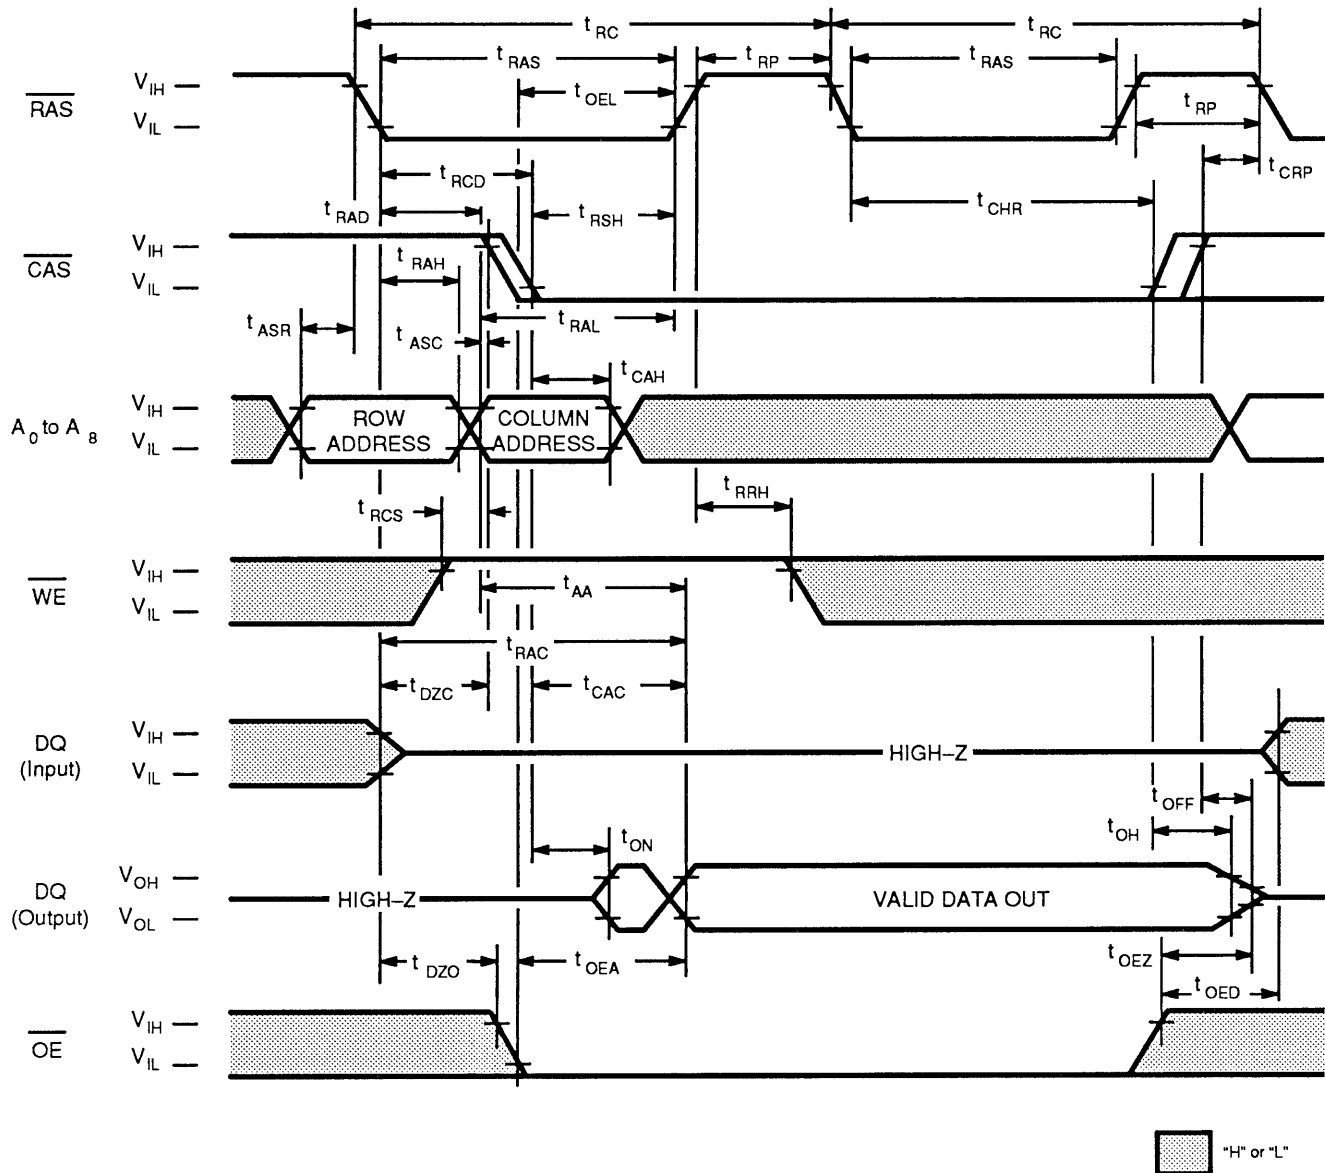

Refresh of RAM memory cells is accomplished by performing a read, a write, or a read-modify-write cycle at each of 512 row addresses every 8.2-milliseconds. Three refresh modes are available: $\overline{\text{RAS}}$ -only refresh, $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh, and hidden refresh.

$\overline{\text{RAS}}$ -only refresh is performed by keeping $\overline{\text{RAS}}$ Low and $\overline{\text{CAS}}$ High throughout the cycle; the row address to be refreshed is latched on the falling edge of $\overline{\text{RAS}}$. During $\overline{\text{RAS}}$ -only refresh, DOUT pin is kept in a high-impedance state.

Figure 13. $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ Refresh Cycle (Addresses = $\overline{\text{WE}} = \overline{\text{OE}} = \text{"H" or "L"}$)**DESCRIPTION**

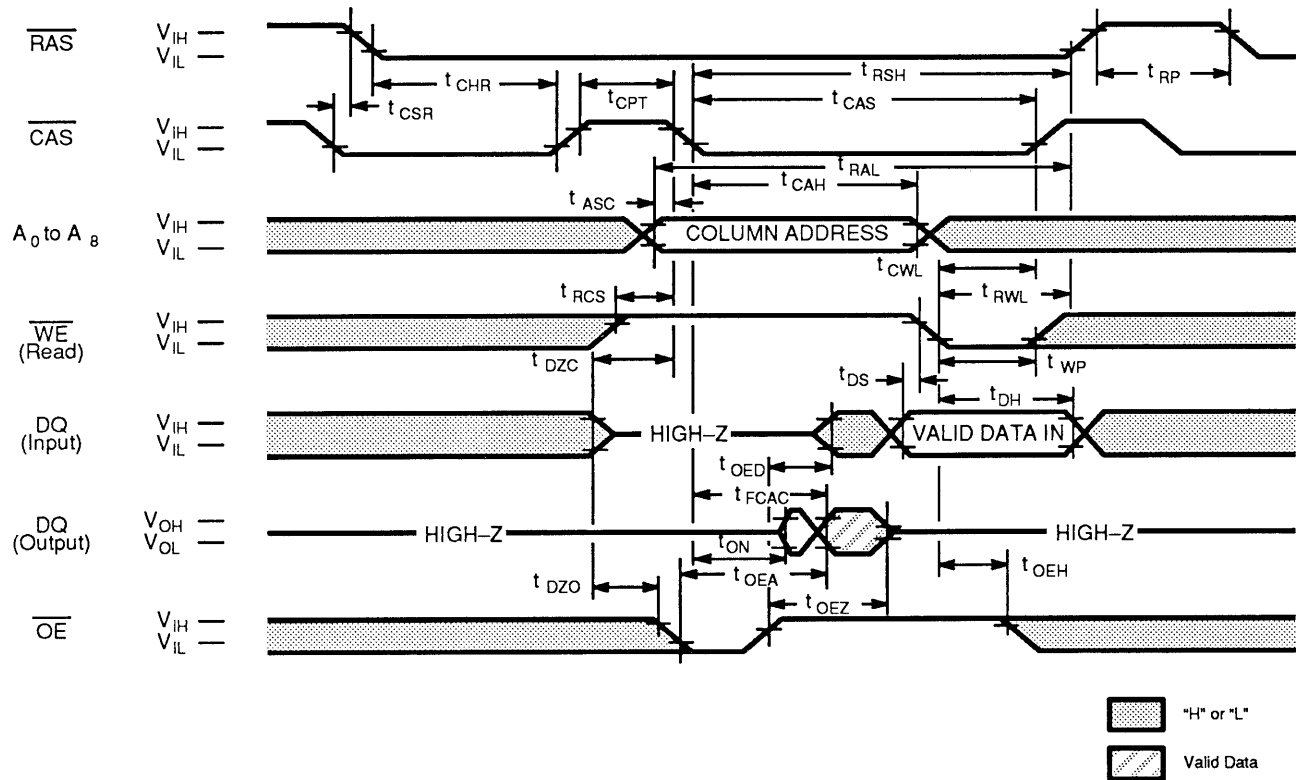

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh is an on-chip refresh capability that eliminates the need for external refresh addresses. If $\overline{\text{CAS}}$ is held Low for the specified setup time (t_{CSR}) before $\overline{\text{RAS}}$ goes Low, the on-chip refresh control clock generators and refresh address counter are enabled. An internal refresh operation automatically occurs and the refresh address counter is internally incremented in preparation for the next $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh operation.

Figure 14. Hidden Refresh Cycle

DESCRIPTION

A hidden refresh cycle may be performed while maintaining the latest valid data at the output by extending the active time of \overline{CAS} and cycling \overline{RAS} . The refresh row address is provided by the on-chip refresh address counter. This eliminates the need for the external row address that is required by DRAMs that do not have \overline{CAS} -before- \overline{RAS} refresh capability.

Figure 15. $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ Refresh Counter Test Cycle**DESCRIPTION**

A special timing sequence using the $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh counter test cycle provides a convenient method to verify the functionality of $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh circuitry. If, after a $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle, $\overline{\text{CAS}}$ makes a transition from High to Low while $\overline{\text{RAS}}$ is held Low, read and write operations are enabled as shown above. Row and column addresses are defined as follows:

Row Address: Bits A0 through A8 are defined by the on-chip refresh counter.

Column Address: Bits A0 through A8 are defined by latching levels on A0–A8 at the second falling edge of $\overline{\text{CAS}}$.

The $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ Counter Test procedure is as follows ;

- 1) Initialize the internal refresh address counter by using 8 $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycles.
- 2) Use the same column address throughout the test.
- 3) Write "0" to all 512 row addresses (DQ1 to DQ4) at the same column address by using normal write cycles.
- 4) Read "0" written in procedure 3) and check; simultaneously write "1" to the same addresses by using $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh counter test (read-modify-write cycles). Repeat this procedure 512 times with addresses generated by the internal refresh address counter.
- 5) Read and check data written in procedure 4) by using normal read cycle for all 512 (DQ1 to DQ4) memory locations.
- 6) Complement test pattern and repeat procedures 3), 4), and 5).

(At recommended operating conditions unless otherwise noted.)

No.	Parameter	Symbol	MB81C4256A-60		MB81C4256A-70		MB81C4256A-80		MB81C4256A-10		Unit
			Min	Max	Min	Max	Min	Max	Min	Max	
90	Access Time from $\overline{\text{CAS}}$	t_{FCAC}	—	40	—	45	—	50	—	60	ns
91	$\overline{\text{CAS}}$ Precharge Time	t_{CPT}	20	—	20	—	20	—	20	—	ns

Note . Assumes that $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh counter test cycle only.

PACKAGE DIMENSIONS

(Suffix —P)

Dimensions in
inches (millimeters)

(Suffix -PJ)

Technical drawing of a 26-pin D-sub connector. The drawing includes a top view, a side view, and a detail of the "A" part.

Top View Dimensions:

- Overall Width: $.675 \pm .005$ (17.15 \pm 0.13)
- Overall Height: $.332 \pm .005$ (8.43 \pm 0.13)
- Pin Pitch (Typical): $.100$ (2.54) TYP
- Reference Dimension: $.600$ (15.24) REF
- Pin 1 Location: $.050 \pm .005$ (1.27 \pm 0.13) from the bottom left corner.
- Pin Numbers: 1, 5, 9, 13, 14, 18, 22, 26.
- INDEX: A circular feature on the left side of the housing.

Side View Dimensions:

- Overall Height: $.268 \pm .020$ (6.81 \pm 0.51)
- Mounting Flange Thickness: $.140$ (3.55) MAX
- Flange Width: $.089$ (2.25) NOM
- Pin Thickness: $.025$ (0.64) MIN

Detail of "A" part:

- Overall Width: $.032$ (0.81) MAX
- Pin Thickness: $.017 \pm .004$ (0.43 \pm 0.10)

Bottom View Dimensions:

- Overall Height: $.098$ (2.50) NOM
- Pin Pitch: $.004$ (0.10)
