## DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of four series of handbooks:

ELECTRON TUBES BLUE

## SEMICONDUCTORS RED

INTEGRATED CIRCUITS
PURPLE

## COMPONENTS AND MATERIALS

The contents of each series are listed on pages iv to viii.
The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.
When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Electronic Components and Materials Division is given in our Preferred Type Range catalogue (issued annually).
Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.
Product specialists are at your service and enquiries will be answered promptly.

## ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks comprises:

## T1 Tubes for r.f. heating

T2a Transmitting tubes for communications, glass types
T2b Transmitting tubes for communications, ceramic types
T3 Klystrons
T4 Magnetrons for microwave heating
T5 Cathode-ray tubes
Instrument tubes, monitor and display tubes, C.R. tubes for special applications
T6 Geiger-Müller tubes

T8 Colour display systems
Colour TV picture tubes, colour data graphic display tube assemblies, deflection units
T9 Photo and electron multipliers
T10 Plumbicon camera tubes and accessories

T11 Microwave semiconductors and components
T12 Vidicon and Newvicon camera tubes

T13 Image intensifiers and infrared detectors

T15 Dry reed switches
T16 Monochrome tubes and deflection units
Black and white TV picture tubes, monochrome data graphic display tubes, deflection units

## SEMICONDUCTORS (RED SERIES)

The red series of data handbooks comprises:
S1 Diodes
Small-signal silicon diodes, voltage regulator diodes ( $<1,5 \mathrm{~W}$ ), voltage reference diodes, tuner diodes, rectifier diodes

S2a Power diodes

S2b Thyristors and triacs
S3 Small-signal transistors
S4a Low-frequency power transistors and hybrid modules
S4b High-voltage and switching power transistors
S5 Field-effect transistors

S6 R.F. power transistors and modules

S7 Surface mounted semiconductors

S8 Devices for optoelectronics
Photosensitive diodes and transistors, light-emitting diodes, displays, photocouplers, infrared sensitive devices, photoconductive devices.

S9 Power MOS transistors

S10 Wideband transistors and wideband hybrid IC modules

S11 Microwave transistors

S12 Surface acoustic wave devices

S13 Semiconductor sensors

## INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of data handbooks comprises:

## EXISTING SERIES

Superseded by:
IC1 Bipolar ICs for radio and audio equipment
IC01N

IC2 Bipolar ICs for video equipment
ICO2Na and 1 CO 2 Nb
IC3 ICs for digital systems in radio, audio and video equipment IC01N, IC02Na and IC02Nb

## IC4 Digital integrated circuits

 CMOS HE4000B familyIC5 Digital integrated circuits - ECL IC08N
ECL10000 (GX family), ECL100 000 (HX family), dedicated designs
IC6 Professional analogue integrated circuits
IC7 Signetics bipolar memories
IC8 Signetics analogue circuits IC11N
IC9 Signetics TTL logic ICO9N and IC15N
IC10 Signetics Integrated Fuse Logic (IFL) IC13N
IC11 Microprocessors, microcomputers and peripheral circuitry IC14N

## NEW SERIES

IC01N Radio, audio and associated systems
(published 1985)
Bipolar, MOS
IC02Na Video and associated systems
(published 1985)
Bipolar, MOS
Types MAB8031AH to TDA1524A

IC02Nb Video and associated systems (published 1985)
Bipolar, MOS
Types TDA2501 to TEA1002
IC03N Integrated circuits for telephony
IC04N HE4000B logic family CMOS

IC05N HE4000B logic family - uncased ICs (published 1984)
CMOS

IC06N* High-speed CMOS; PC74HC/HCT/HCU
(published 1986)
Logic family
IC07N High-speed CMOS; PC54/74HC/HCT/HCU - uncased ICs Logic family

IC08N ECL 10K and 100K logic families (published 1984)
IC09N TTL logic series (published 1984)
IC10N Memories
MOS, TTL, ECL

IC11N Linear LSI
(published 1985)

IC12N Semi-custom gate arrays \& cell libraries ISL, ECL, CMOS

IC13N Semi-custom (published 1985)
Integrated Fuse Logic
IC14N Microprocessors, microcontrollers \& peripherals (published 1985) Bipolar, MOS

IC15N FAST TTL logic series
(published 1984)

## Note

Books available in the new series are shown with their date of publication.

[^0]
## COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks comprises:
C1 Programmable controller modules
PLC modules, PC20 modules
C2 Television tuners, coaxial aerial input assemblies, surface acoustic wave filters
C3 Loudspeakers
C4 Ferroxcube potcores, square cores and cross cores
C5 Ferroxcube for power, audio/video and accelerators
C6 Synchronous motors and gearboxes
C7 Variable capacitors
C8 Variable mains transformers
C9 Piezoelectric quartz devices
C10 Connectors
C11 Non-linear resistors
C12 Potentiometers, encoders and switches
C13 Fixed resistors
C14 Electrolytic and solid capacitors
C15 Ceramic capacitors
C16 Permanent magnet materials
C17 Stepping motors and associated electronics
C18 Direct current motors
C19 Piezoelectric ceramics
C20 Wire-wound components for TVs and monitors
C21* Assemblies for industrial use
HNIL FZ/30 series, NORbits 60-, 61-, 90-series, input devices
C22 Film capacitors

* To be issued shortly

## LIST OF SYMBOLS

## Symbols denoting electrodes and electrode connections

| $f$ | Heater |
| :---: | :---: |
| k | Cathode |
| g | Grid Grids are distinguished by means of an additional numeral; the electrode nearest to the cathode having the lowest number |
| $\mathrm{x}_{1}, \mathrm{x}_{2}$ | Deflection plates intended for deflection in horizontal direction |
| $\mathrm{y}_{1}, \mathrm{y}_{2}$ | Deflection plates intended for deflection in vertical direction Sectioned deflection plates are indicated by an additional decimal e.g. Y1 . 1 Y1 . 2 and Y2 . 1 Y2 . 2 |
| m | External conductive coating |
| $\ell$ | Fluorescent screen |
| i.c. | Tube pin which must not be connected externally |
| n.c. | Tube pin which may be connected externally |
|  | Symbols denoting voltages |
| V | Symbol for voltage, followed by an index denoting the relevant electrode |
| $V_{f}$ | Heater voltage (r.m.s. value) |
| $V_{p}$ | Peak value of a voltage |
| $V_{(p-p)}$ | Peak-to-peak value of a voltage |
|  | Symbols denoting currents |
| I | Symbol for current followed by an index denoting the relevant electrode |
| $\mathrm{If}_{f}$ | Heater current (r.m.s. value) |
|  | Symbols denoting powers |
| $W_{\ell}$ | Dissipation of the fluorescent screen |
| $W_{g}$ | Grid dissipation |

## Symbols denoting capacitances

## See IEC Publication 100.

## Symbols denoting resistances

R
Symbol for resistance followed by an index for the relevant electrode pair. When only one index is given the second electrode is the cathode
When $R$ is replaced by $Z$ the "resistance" should read "impedance"

## Symbols denoting various quantities

| $L$ | Luminance |
| :--- | :--- |
| $f$ | Frequency |
| $H$ | Magnetic field strength |
| $M$ | Deflection coefficient |
| $M_{\text {sc }}$ | Scan magnification |
| $B$ | Bandwidth |
| I.w. | Line width |
| $e$ | Eccentricity |
| $t_{p}$ | Pulse duration |

## OPERATIONAL RECOMMENDATIONS

## GENERAL

Unless otherwise stated the published data are typical values.

## TYPICAL OPERATION

Under this heading in the data sheets, the conditions are given which result in the specified performance. This performance represents the best compromise for the intended applications of the tube.

## LIMITING VALUES

Unless otherwise stated the tubes are rated according to the absolute maximum rating system.
Limiting values are in accordance with the applicable rating system as defined by IEC publication 134. Reference may be made to one of the following 3 rating systems.

#### Abstract

Absolute maximum rating system. Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions. These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment. The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment components spread and variation, equipment control adjustment, load variations, signal variation, environmental conditions, and spread or variations in characteristics of the device under considerations and of all other electronic devices in the equipment. Design-maximum rating system. Design-maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions. These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration. The equipment manufacturer should design so that, initially and throughout life, no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

[^1]Design-centre rating system. Design-centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under average conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply-voltage variation, equipment component spread and variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations or spread in the characteristics of all electronic devices.
The equipment manufacturer should design so that, initially, no design-centre value for the intended service is exceeded with a bogey electronic device* in equipment operating at the stated normal supply voltage.
If the tube data specify limiting values according to more than one rating system the circuit has to be designed so that none of these limiting values is exceeded under the relevant conditions.
In addition to the limiting values given in the individual data sheets the directives in the following paragraphs should be observed.

## HEATER SUPPLY

The heater voltage must be within $\pm 7 \%$ of the nominal value when the supply voltage is at its nominal value, and when a tube having the published heater characteristics is employed. This figure is permissible only if the voltage variation is dependent upon more than one factor. In these circumstances the total tolerance may be taken as the square root of the sum of the squares of the individual deviations arising from the effect of the tolerances of the separate factors, providing none of these deviations exceeds $\pm 5 \%$. Should the voltage variation depend on one factor only, the voltage variation must not exceed $\pm 5 \%$.
For maximum cathode life it is recommended that the heater supply be stabilized at the nominal heater voltage. Any deviation from this heater voltage has a detrimental effect on tube performance and life, and should therefore be kept to a minimum. Such deviations may be caused by:

- mains voltage fluctuations;
- spread in the characteristics of components such as transformers, resistors, capacitors, etc.;
- spread in circuit adjustments;
- operational variations.

Cathode-ray tubes with a quick-heating cathode should not be used in series with other tubes.

## CATHODE TO HEATER VOLTAGE

The voltage between cathode and heater should be as low as possible and never exceed the limiting values given in the data sheets of the individual tubes. Operation with the heater positive with respect to the cathode is not recommended.
In order to avoid excessive hum the a.c. component of the heater to cathode voltage should be as low as possible and never exceed 20 V r.m.s. (mains frequency). A d.c. connection should always be present between heater and cathode. Unless otherwise specified the maximum resistance should not exceed $1 \mathrm{M} \Omega$; the maximum impedance at mains frequency should be less than $100 \mathrm{k} \Omega$.

## INTERMEDIATE ELECTRODES (between cathode and final accelerator)

In no circumstances should the tube be operated without a d.c. connection between each electrode and the cathode. The total effective impedance between each electrode and the cathode should be as low as possible and never exceed the published maximum value.

* A bogey tube is a tube whose characteristics have the published nominal values for the type. A bogey tube for any particular application can be obtained by considering only those characteristics which are directly related to the application.

## ELECTRODE VOLTAGES

The reference point for electrode voltages is the cathode. For cathode drive service the reference point is grid 1.

## Grid cut-off voltages

Values are given for the limits of grid cut-off voltage at the specified first accelerator voltage. The brightness control voltage should be arranged so that it can handle any tube within the limits shown, at the appropriate first accelerator voltage.

## First accelerator voltage

The first accelerator electrode of a so-called unipotential lens provides independent focus and brightness controls by applying a fixed voltage. Care should be taken not to exceed the maximum and minimum limits for reasons of reliability and performance.

## Focusing voltage

The focusing voltage ( $\mathrm{V}_{\mathrm{g} 3}$ ) should be adjusted to optimum spot size; the voltage may depend on the beam current.
For automatic pre-adjustment (autofocus) of oscilloscope tubes, $\Delta \mathrm{V}_{\mathrm{g} 3}$ should be derived from the grid drive.

## Astigmatism control voltage

To achieve optimum performance under all conditions it is desirable to apply a voltage for control of astigmatism (a difference in potential of this electrode and the y plates). The required range to cover any tube is given in the relevant data.

## Deflection plate shield voltage

It is essential that the deflection plate shield voltage equals the mean $y$ plate voltage.

## Geometry control voltage

By varying the potential of the geometry control electrode, the necessary range of which is given in the relevant data, the occurrence of pin-cushion and barrel-pattern distortion can be controlled.

## Deflection voltages

For optimum performance it is essential that true symmetrical voltages are applied. It should further be noted that the mean $x$ and $y$-plate potentials must be equal. Moreover the deflection plate shield voltage, the mean astigmatism control voltage, if applicable the mean beam centring voltage and the geometry control voltage should also be equal to the mean $x$ and $y$-plate potentials. If use is made of the full deflection capabilities of the tube, the deflection plates will intercept part of the electron beam near the edge of the scan. Therefore a low impedance deflection plate drive is necessary. (See also ELECTRODE CURRENTS AND CIRCUIT IMPEDANCES on the next page.)

## Raster distortion and its determination

## Limits of raster distortion are given for most tubes.

A graticule, consisting of concentric rectangles is aligned with the electrical $x$-axis of the tube. The edges of a raster will fall between these rectangles with optimum correction potentials applied.
Measuring procedure:

- Shift the $x$-trace to the centre of the graticule.
- Align horizontal centre line of graticule with the centre line of the $x$-trace.
- Shift $x$-trace vertically between upper and lower horizontal lines of graticule; the centre of the $x$-trace now will not fall outside the area bounded by the horizontal graticule lines.
- Without moving the graticule, switch to a vertical trace and shift this trace horizontally (left and right) between the pairs of vertical lines of the graticule; the centre of the $y$-trace will not fall outside the area bounded by the vertical graticule lines.
- Focus and astigmatism will be adjusted for optimum performance.
- Pattern geometry correction will be adjusted for optimum performance in the sense of minimizing simultaneously the deviation of the centre of $x$ and $y$-trace respectively.

## Linearity

Unless otherwise stated the linearity is defined as the sensitivity at a deflection of $75 \%$ of the useful scan with respect to deviations from the sensitivity at a deflection of $25 \%$ of the useful scan. These sensitivities will not differ by more than the indicated value.

## Post deflection shield voltage

In order to optimize contrast in mesh tubes a fixed negative voltage with respect to the geometry control voltage should be applied. The range is given in the data.

## Final accelerator voltage

$\rightarrow$ Tubes with PDA are designed for a given range of final accelerator voltage to first accelerator voltage ratio. Operation at higher or lower ratios may result in changes in deflection uniformity, pattern distortion and useful scan.

## High tension supply

In order to avoid damage to the screen it is important that a deflection voltage, e.g. the time base voltage, is applied prior to the high tension.

## ELECTRODE CURRENTS AND CIRCUIT IMPEDANCES

In each electrode currents caused by interception of a part of the electron beam, leakage or secondary emission, may occur in both directions. For oscilloscope tubes currents up to $10 \mu \mathrm{~A}$ can be expected in the focusing electrode and the deflection plates. In addition, if use is made of the full deflection capabilities, each deflection plate may intercept up to $50 \%$ of the beam current.
For oscilloscope tubes with beam-limiting apertures, the grid 2 and/or grid 4 circuit impedance should be less than $10 \mathrm{k} \Omega$.
For all tubes the control grid circuit resistance should be less than $1 \mathrm{M} \Omega$.

## CAPACITANCES

Unless otherwise stated the values given are nominal values measured at the contacts of a cold tube. The contacts and measuring leads are screened.

## LINE WIDTH

The line width is measured with the shrinking raster method. Focusing and astigmatism voltages should be adjusted to minimize the horizontal and vertical trace widths simultaneously at the screen centre. The raster width should be reduced until the line structure is just discernible. This raster width, divided by the number of lines in the display, is the measure of the line width.

## USEFUL SCREEN AREA

This is the area on the inner side of the faceplate which is provided with phosphor; it may remain uncovered and thus visible from the outside.

## USEFUL SCAN AREA

This is the part of the useful screen area in which the specified performance applies.

## LUMINESCENT SCREEN

To prevent permanent screen damage, care should be taken:

- not to operate the tube with a stationary picture at high beam currents for extended periods;
- not to operate the tube with a stationary or slowly moving spot except at extremely low beam currents.

## MOUNTING

Unless otherwise stated the tubes can be mounted in any position. However, a tube should not be supported by the base alone or near the base region, and under no circumstances should the socket be allowed to support the tube.
The tube socket should not be rigidly mounted but should have flexible leads and be allowed to move freely. The mass of the mating socket with circuitry should not be more than 100 g ; maximum permissible torque is 40 mNm .

## Shielding

Oscilloscope tubes need a magnetic shielding for proper operation. Especially for types with an internal permanent magnetic lens system (IMC), a magnetic induction at the tube neck greater than 0,02 T (200 gauss), which corresponds to a magnetic field strength of $1,6 \times 10^{4} \mathrm{~A} / \mathrm{m}$, must be avoided.

## HANDLING

Handling (or destroying) tubes should be done by qualified personnel.
The tubes are evacuated, which implies that mechanical damage must be avoided; care should be taken not to scratch or knock any part of the tube.
Remember when replacing or servicing a tube that a residual electrical charge may be carried by the final accelerator contact and also the external coating if not earthed. Before removing the tube from the equipment, earth the external coating and short the final accelerator contact to the coating.

## PHOTOMETRIC UNITS

S.I. photometric units

| quantity | symbol | S.I. unit | remarks |
| :--- | :--- | :--- | :--- |
| luminous intensity | I | cd (candela) |  |
| luminous flux | $\phi$ | Im (lumen) |  |
| quantity of light | Q | $\mathrm{Im} \cdot \mathrm{s}$ |  |
| luminance | L | $\mathrm{cd} / \mathrm{m}^{2}$ | $1 \mathrm{~cd} / \mathrm{m}^{2}=1 \mathrm{nit}$ |
| luminous exitance | M | $\mathrm{Im} / \mathrm{m}^{2}$ | formerly luminous emittance |
| illuminance | E | Ix (lux) | formerly illumination |

Other photometric units; conversion factors
1 stilb $\quad=1 \mathrm{~cd} / \mathrm{cm}^{2}=10^{4} \mathrm{~cd} / \mathrm{m}^{2}=4 \pi$ lumen $/ \mathrm{cm}^{2}$
1 lambert $\quad=\frac{1}{\pi} \mathrm{~cd} / \mathrm{cm}^{2}=\frac{10^{4}}{\pi} \mathrm{~cd} / \mathrm{m}^{2}=4$ lumen $/ \mathrm{cm}^{2}$
1 foot lambert $=\frac{1}{\pi} \mathrm{~cd} / \mathrm{ft}^{2}=3,426 \mathrm{~cd} / \mathrm{m}^{2}$
1 foot candle $=10,764$ lux

## TYPE DESIGNATION

## Pro Electron type designation code

The CRT type number begins with a single letter followed by two sets of digits, and ends with one or two letters.
The first letter indicates the prime application of the tube:
D : Oscilloscope tube, single trace
E : Oscilloscope tube, multiple trace
F: Radar display tube, direct view
L: Storage display tube
M : TV display tube for professional application, direct view
P : Display tube for professional application, projection
Q : Flying spot scanner tube
The first group of digits indicates the diameter or diagonal of the screen in cm .
The second group of digits is a two or three-figure serial number indicating a particular design or development.
The final group of letters indicates the properties of the phosphor screen (see section "Screen types").
For CRTs with internal graticule a suffix consisting of two or more figures follows the type designation, separated from it by an oblique stroke.
Example:

## SCREEN TYPES

| new system | old system | fluorescent colour | phosphorescent colour | persistence | equivalent <br> JEDEC <br> designation |
| :---: | :---: | :---: | :---: | :---: | :---: |
| BA | C | purplish-blue | - | very short | - |
| BE | B | blue | blue | medium short | P11 |
| BF | U | purplish-blue | - | medium short | - |
| GH | H | green | green | medium short | P31 |
| GK | G | yellowish-green | yellowish-green | medium | - |
| GM | P | purplish-blue | yellowish-green | long | P7 |
| GP | - | bluish-green | green | medium short | P2 |
| GR | - | green | green | long | P39 |
| GU | - | white | white | very short | - |
| GY | - | green | green | medium | P43 |
| KC | - | yellow-green | yellow-green | medium short | - |
| W | w | white | - | - | P4 |
| WA | - | white | - | - |  |
| WE | - | white | white | medium short | P45 |
| X | X | tri-colour screen | - | - | - |
| YA | Y | yellowish-orange | yellowish-orange | medium | - |

The phosphor information given in this section is based in general upon the original phosphor registration (TEPAC and/or PRO ELECTRON) and can be used as a selection guide. Slight differences may occur between the actual phosphor properties and the registered data.

## Survey of applications and persistence of screens

| $M_{y}$ | max. | $11,5 \mathrm{~V} / \mathrm{cm}$ $12,5 \mathrm{~V} / \mathrm{cm}$ |
|  | max. see note | $1 \% 2)$ |
|  | min . | 60 mm |
|  | min. | 50 mm |

1) All that will be necessary when putting the tube into operation is to adjust the astigmatism control voltage once for optimum spot shape in the screen centre. The control voltage will always be in the range stated, provided the mean $\times$ plate and certainly the mean $y$ plate potential was made equal to $V_{g 2, g 4, g 5, \ell}$ with zero astigmatism correction.
2) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
3) The mean $x$ and certainly the mean $y$ plate potential should be equal to $V_{g 2, g 4, g 5, \ell}$ with astigmatism adjustment set to zero.
4) A graticule, consisting of concentric rectangles of $40 \mathrm{~mm} \times 50 \mathrm{~mm}$ and $39,2 \mathrm{~mm} \times 49 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. The edges of a raster will fall between these rectangles.

## INSTRUMENT CATHODE-RAY TUBE

7 cm diameter flat-faced monoaccelerator oscilloscope tube with low heater consumption.
QUICK REFERENCE DATA

| Accelerator voltage | $V_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5}(\ell)$ | 1000 V |

## NOTES

1. The mean $x$-plate potential and the mean $y$-plate potential should be equal to $V_{g 2, g 4, g 5(l) \text { (with }}$ astigmatism control voltage set to zero).
2. When putting the tube into operation the astigmatism control voltage should be adjusted only once for optimum spot size in the centre of the screen. The control voltage will be within the stated range, provided the conditions of note 1 are adhered to.
3. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.
As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows.
a) Under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4, g} \mathrm{~g}(\mathrm{\ell})$ for optimum spot quality at the centre of the screen.
b) Under these conditions, but without raster, the deflection plate voltages should be changed to: $\mathrm{V}_{\mathrm{x} 1}=\mathrm{V}_{\mathrm{x} 2}=1000 \mathrm{~V} ; \mathrm{V}_{\mathrm{y} 1}=300 \mathrm{~V} ; \mathrm{V}_{\mathrm{y} 2}=700 \mathrm{~V}$, thus directing the total beam current to $\mathrm{y}_{2}$. Measure the current on $\mathrm{y}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{y} 2}=10 \mu \mathrm{~A}$.
c) Set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{g} 1}$ control. The screen current of the resulting raster display is now $10 \mu \mathrm{~A}$.
d) Focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule, consisting of concentric rectangles of $57,0 \mathrm{~mm} \times 33,0 \mathrm{~mm}$ and $56 \mathrm{~mm} \times 31,6 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. The edges of a raster will fall between these rectangles.

## FOCUSING electrostatic

DEFLECTION (note 1) double electrostatic
$x$ plates symmetrical
y plates symmetrical)
If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam, hence a low impedance deflection plate drive is desirable.
Angle between $x$ and $y$ traces

$$
90 \pm 10
$$

## LINE WIDTH

Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$. (note 2)
Line width l.w. $0,27 \mathrm{~mm}$

## Notes

1. The mean $x$ and certainly the mean $y$ plate potentials should be equal to $V_{g 2, g 4, g 5, \ell \text { with }}$ astigmatism adjustment set to zero.
2. As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g}}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g}} \mathrm{~g}, \mathrm{~g} 5$, 凤 for optimum spot quality at the centre of the screen.
b) under these conditions, but no raster, the deflection plate voltages should be changed to: $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=1500 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=800 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1200 \mathrm{~V}$, thus directing the total beam current to $\mathrm{x}_{2}$. Measure the current on $x_{2}$ and adjust $V_{g 1}$ for $I_{x 2}=10 \mu \mathrm{~A}$ (being the beam current $I_{\ell}$ ).
c) set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{g} 1}$ control. Now a raster display with a true $10 \mu \mathrm{~A}$ screen current is achieved.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.

If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

## DYNAMIC DEFLECTION DEFOCUSING CORRECTION

The tube has a special electrode, positioned between the x and y -plates, for dynamic correction of deflection defocusing, to improve the uniformity of the extremely good line width up to the screen edges. If use is made of this dynamic correction, a negative voltage proportional to, and approx. $50 \%$ of, the negative horizontal deflection plate voltage should be applied to this electrode (grid 6).
The correction-circuit impedance must be $\leqslant 100 \mathrm{k} \Omega$. To prevent distortion, the output impedances of the $x$-amplifiers should be $\leqslant 10 \mathrm{k} \Omega$.
If no correction is required, grid 6 should be connected to mean $x$-plate potential $\left(V_{g 2}(\ell)\right.$.

[^8]
## NOTES

1. The mean x-plate potential and the mean y-plate potential should be equal to $\mathrm{V}_{\mathrm{g} 2}(\ell)$.
2. The tube features internal magnetic correction for spot shaping (astigmatism) and vertical eccentricity calibration. Correction is obtained at $\mathrm{V}_{\mathrm{g} 2}=1800$ to 2200 V ; optimum at $\mathrm{V}_{\mathrm{g} 2}=2000 \mathrm{~V}$.
3. Measured with the shrinking raster method within the useful scan under typical operating conditions, adjusted for optimum focus and dynamic correction applied.
As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) Under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ for smallest spot size at the centre of the screen. When measuring the beam current, grid 6 should be connected to g2-potential and the diodes should be disconnected from the x-plates.
b) Under these conditions, but without raster, the deflection plate voltages should be changed to: $V_{y 1}=V_{y 2}=2000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=1300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1700 \mathrm{~V}$, thus directing the total beam current to $\mathrm{x}_{2}$. Measure the current on $x_{2}$ and adjust $V_{g 1}$ for $I_{x 2}=10 \mu A$.
c) Set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{g} 1}$ control. The screen current of the resulting raster display is now $10 \mu \mathrm{~A}$.
Adjust $\mathrm{V}_{\mathrm{g} 3}$ for optimum focus in the centre of the screen and apply dynamic correction to grid 6 for optimum vertical line width.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of $70 \mathrm{~mm} \times 56 \mathrm{~mm}$ and $68,4 \mathrm{~mm} \times 54,4 \mathrm{~mm}$ is aligned with the face plate (using the reference points). With optimum trace rotation correction, horizontal and vertical lines will fall between these rectangles.

## Notes

1. The tube is designed for optimum performance when operating at a ratio $V_{g 8(\ell)} / V_{g 2, g 4}=6,7$. The geometry control electrode voltage $\mathrm{V}_{\mathrm{g} 7}$ should be adjusted within the indicated range (values with respect to the mean x-plate potential).
A negative control voltage $\mathrm{V}_{\mathrm{g} 6}$ (with respect to the mean x-plate potential) will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion, and a slight increase of background light. By the use of the two voltages $\mathrm{V}_{\mathrm{g} 6}$ and $\mathrm{V}_{\mathrm{g} 7}$, the best compromise between background light and raster distortion can be found.
2. The deflection plate shield voltage should be equal to the mean y-plate potential. The mean $x$-plate and $y$-plate potentials should be equal for optimum spot quality.
3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4. Measured with the shrinking raster method in the centre of the screen, under typical operating conditions, adjusted for optimum spot size, at a beam current of $10 \mu \mathrm{~A}$.
5. A graticule consisting of concentric rectangles of $80 \mathrm{~mm} \times 64 \mathrm{~mm}$ and $78,2 \mathrm{~mm} \times 62,6 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.
6. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.

## FOCUSING

electrostatic

DEFLECTION
double electrostatic
$x$-plates
symmetrical
$y$-plates
symmetrical
If use is made of the full deflection capabilities of the tube the deflection plates will block part of the electron beam, hence a low impedance deflection plate drive is desirable.

## DYNAMIC DEFLECTION DEFOCUSING CORRECTION

The tube has a special electrode, positioned between the $x$ and $y$-plates, for dynamic correction of deflection defocusing, to improve the uniformity of the extremely good line width up to the screen edges. If use is made of this dynamic correction, a negative voltage proportional to, and approx. $50 \%$ of, the negative horizontal deflection plate voltage should be applied to this electrode (grid 6).
The correction-circuit impedance must be $\leqslant 100 \mathrm{k} \Omega$. To prevent distortion, the output impedances of the $x$-amplifiers should be $\leqslant 10 \mathrm{k} \Omega$.
If no correction is required, grid 6 should be connected to mean $x$-plate potential $\left(\mathrm{V}_{\mathrm{g} 2(\ell)}\right)$.
CAPACITANCES (approx. values)

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $82 \mathrm{~mm} \times 66 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The mean $x$-plate potential and the mean y-plate potential should be equal to $V_{g 2, g 4, g 5(\ell)}$.
3. The tube features internal magnetic correction for astigmatism, orthogonality and eccentricity calibration. Optimum spot is obtained if $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5(\ell)}$ is equal to mean y-potential.
4. An actual focus range of approx. 50 V should be provided on the front panel. $\mathrm{V}_{\mathrm{g} 3}$ decreases with increasing grid drive (see also Fig. 5).
5. Intensity control on the front panel should be limited to the maximum useful screen current (approx. $80 \mu \mathrm{~A}$; see also Fig. 5). It is to be adjusted either by the grid drive (up to 30 V ) or for maximum acceptable line width. The corresponding cathode current or $\operatorname{Ig}_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5}$ (up to $500 \mu \mathrm{~A}$ ) depend on the cut-off voltage and cannot be used for control settings.
6. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
7. A graticule consisting of concentric rectangles of $80 \mathrm{~mm} \times 64 \mathrm{~mm}$ and $78,3 \mathrm{~mm} \times 62,3 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
8. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $180 \pm 25 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by $0,4 \% / \mathrm{K}$ for rising temperature. Approx. 6 mA causes 10 trace rotation. Thus maximum required voltage is approx. 12 V for tube tolerances ( $\pm 5^{\circ}$ ) and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).
9. Measured with the shrinking raster method within the useful scan under typical operating conditions, adjusted for optimum focus and dynamic correction applied.
As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) Under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ for smallest spot size at the centre of the screen. When measuring the beam current, grid 6 should be connected to g2-potential and the diodes should be disconnected from the x-plates.
b) Under these conditions, but without raster, the deflection plate voltages should be changed to: $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=1300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1700 \mathrm{~V}$, thus directing the total beam current to $\mathrm{x}_{2}$. Measure the current on $\mathrm{x}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{x} 2}=10 \mu \mathrm{~A}$.
c) Set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{g} 1}$ control. The screen current of the resulting raster display is now $10 \mu \mathrm{~A}$.
Adjust $\mathrm{V}_{\mathrm{g} 3}$ for optimum focus in the centre of the screen and apply dynamic correction to grid 6 for optimum vertical line width.

Fig. 5 Screen current ( $I_{\text {screen }}$ ) and focusing voltage $\left(\mathrm{V}_{\mathrm{g} 3}\right)$ as a function of grid drive voltage $\left(\mathrm{V}_{\mathrm{d}}\right)$; typical curves.

## INSTRUMENT CATHODE-RAY TUBE

- 12 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- low heater power consumption
- internal graticule
- high sensitivity and high brightness
- short overall length
- for compact oscilloscopes with up to 75 MHz bandwidth

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $82 \mathrm{~mm} \times 66 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; floating mean $x$ - or $y$-potentials will result into non-uniform line width and geometry distortion. The mean $x$ - and $y$-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry. A range of $\Delta \mathrm{V}_{\mathrm{g} 5}=-50$ to +50 V may be applied for pincushion/barrel correction. The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case $\mathrm{V}_{\mathrm{g} 5}$ must be made equal to mean x-potential, and a range of 0 to -25 V with respect to mean $y$-potential will be required on g 4 for astigmatism correction. The circuit resistance for $\mathrm{V}_{\mathrm{g} 4}$ should be $\leqslant 10 \mathrm{k} \Omega$.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of $80 \mathrm{~mm} \times 64 \mathrm{~mm}$ and $78,4 \mathrm{~mm} \times 62,4 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $185 \pm 25 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. At typical operation $\left(\mathrm{V}_{\mathrm{g} 5}=2200 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 7}=16,5 \mathrm{kV}\right)$ approx. $6,5 \mathrm{~mA}$ causes $1^{\circ}$ trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances ( $\pm 5^{\circ}$ ) and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).
The required current for $1^{0}$ trace rotation is related to approx. $\sqrt{\mathrm{V}_{\mathrm{g} 5}}$.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.
8. The $X$-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, when the tube is used within its limiting values (beam current $I_{\ell} \leqslant 100 \mu \mathrm{~A}$ ).

Fig. 5 Beam current ( $I_{b x}$ ) and focusing voltage $\left(\mathrm{V}_{\mathrm{g} 3}\right)$ as a function of grid drive voltage $\left(\mathrm{V}_{\mathrm{d}}\right)$ at $\mathrm{V}_{\mathrm{g} 7}=16,5 \mathrm{kV}, \mathrm{V}_{\mathrm{g} 5}=2,2 \mathrm{kV}$; typical curves.
$I_{b x}$ is the beam current, without scan, measured on $x 2$, when the deflection plate potentials have been adjusted to $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2200 \mathrm{~V}, \mathrm{~V}_{\mathrm{x} 1}=1500 \mathrm{~V}, \mathrm{~V}_{\mathrm{x} 2}=1900 \mathrm{~V}$, thus directing the total beam current to $\times 2$.

Measured with the shrinking rastermethod in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $\mathrm{I}_{\ell}=10 \mu \mathrm{~A} .1$ )

Line width
l.w. 0.30 mm
${ }^{1}$ ) As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{gl}}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5, \ell}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but no raster, the deflection plate voltages should be changed to
$\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=1300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1700 \mathrm{~V}$, thus directing the total beam current to x 2 .
Measure the current on $\mathrm{x}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{x} 2}=10 \mu \mathrm{~A}$ (being the beam current I )
c) set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{gl}}$ control. Now a raster display with a true $10 \mu \mathrm{~A}$ screen current is achieved.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
${ }^{3}$ ) See next page.

## INSTRUMENT CATHODE-RAY TUBE

TheD13-500GH/01 is a wide-band oscilloscope tube designed for observation and measurement of high frequency phenomena.
This tube has a rectangular 13 cm diagonal flat face with aluminized screen and internal graticule, post-deflection accelerator with mesh, vertical deflection by means of a symmetrical helix system, scan magnification in the vertical direction by means of an electrostatic quadrupole lens and correction coils for trace alignment, vertical shift of the display area and correction of the orthogonality of traces.

## DESCRIPTION

General
The D13-500GH/01 has been primarily designed for wide-band high-frequency applications. It combines high brightness, high deflection sensitivity and a large bandwidth of the vertical deflection system.
In order to obtain the high sensitivity, the post-deflection acceleration system embodies a mesh. The sensitivity in the vertical direction has been further increased by means of an electrostatic quadrupole lens that has been inserted between the vertical deflection system and the horizontal deflection plates. The large bandwidth has been obtained by using, for the vertical deflection, a delay-line system instead of deflection plates. With the typical operating conditions, 2500 V first accelerator voltage and 15000 V final accelerator voltage, the vertical and the horizontal deflection factors are about $2 \mathrm{~V} / \mathrm{cm}$ and $15 \mathrm{~V} / \mathrm{cm}$ respectively, with a $10 \times 6 \mathrm{~cm}^{2}$ display area.

The bulb has a rectangular face and the screen is aluminized. To eliminate parallax errors, an internal graticule is incorporated. Correction coils have been provided to permit image rotation, correction of the orthogonality of traces and the adjust ment of the vertical useful scan with respect to the graticule.

Fig. 1
Rise time of the display $\boldsymbol{T}$ as a function of the rise time of the input signal $\boldsymbol{\tau}_{2}$

## The vertical deflection system

For the vertical deflection, a delay-line system is used so that transit-time effects are practically eliminated. The system consists of two flattened helices to which a symmetrical deflection signal should be applied. Under these conditions, the characteristic impedance of each helix is $150 \Omega$. The input and output terminals are brought out on opposite sides of the neck on the same plane. The input terminals are connected to the beginning of the helices by means of a matched, internal two wire transmission line. The output of the deflection system should be properly terminated in order to avoid signal reflections.

With the typical operating conditions, the band-width of the deflection system, i.e. the frequency at which the sensitivity is 3 dB below its value at D.C., is about 800 MHz . Even above this frequency, the response decreases only gradually so that, for narrow -band applications, the tube can be used with reduced vertical sensitivity up to about 2000 MHz .

The rise time $\boldsymbol{\tau}_{1}$, i.e. the time interval during which the display of an ideal stepfunction signal applied to the input goes from $10 \%$ to $90 \%$ of its final value, is about 0.45 ns . If the input signal has the rise-time $\tau_{2}$, the rise-time $\boldsymbol{\tau}$ of the display is approximately given by

$$
\tau=\sqrt{\tau_{1}^{2}+\tau_{2}^{2}}
$$

In Fig. $1, \tau^{\prime}$ has been plotted as a function of $\tau_{2}$, with $\tau_{1}=0.45 \mathrm{~ns}$. If, for example, the tube is used in combination with an amplifier and the rise-time of the display is to be 1.4 ns (corresponding with 250 MHz band-width), the rise-time of the amplifier should be 1.33 ns . It can be seen that in this region the rise-time of the display is almost equal to the amplifier rise-time, without a significant contribution of the cathode-ray tube.

If the tube is to be used without an amplifier in order to make use of its full bandwidth capabilities, care should be taken to ensure good symmetry of the input signal.
Fig. 2 shows how the tube can be connected to a $50 \Omega$ coaxial input. A matched power divider is used which delivers two identical output signals. One of these is inverted by means of a pulse inverter. An additional length of $50 \Omega$ cable should be inserted into the path of the non-inverted signal having the same delay time as the pulse inverter so that the two signals arrive at the input of the deflection system at the same time. The $75 \Omega$ shunt resistors serve to obtain a correct termination of the $50 \Omega$ lines. Since each branch of the power divider has 6 dB attenuation, the sensitivity, measured at the $50 \Omega$ input, is also $2 \mathrm{~V} / \mathrm{cm}$.

Fig. 2

Note: Delay of inverter B and cable C are equal.

## Scan magnifier and focusing system

As already mentioned, an electrostatic quadrupole lens, i.e. an electron lens which has two mutually perpendicular planes of symmetry, divergent in one plane and convergent in the other, is used for the magnification of the vertical deflection. This lens is inserted between the vertical deflection system and the horizontal deflection plates, with its plane of divergence in the direction of the vertical deflection.
Therefore, it magnifies the vertical deflection without affecting the horizontal deflection.

Because of the astigmatic properties of this quadrupole lens, a conventional, rotationally symmetrical focusing lens cannot be used. Instead of this, two more electrostatic quadrupole lenses are incorporated so that focusing is accomplished by means of three quadrupole lenses, with alternating orientation of their planes of convergence and divergence. The focusing action is schematically shown in Fig. 3. The strength of the scan-magnifier lens is controlled by applying to the electrode $g_{9}$ a negative voltage with respect to $g_{2}$. Within a certain range of this voltage, cor responding to a scan-magnification factor Msc, i.e. the ratio of the deviations on the screen with and without scan magnification respectively, between 1.8 and 2 the combined effect of the three lenses will yield an approximately circular spot at moderate beam currents. (At high beam currents, when space-charge repulsion causes an increase of spot size, the width of the vertical lines will be smaller than that of the horizontal lines).

## D13-500GH/OI

In this range, line-width at a fixed value of screen current, and screen current at a fixed value of grid No. 1 voltage, are increasing functions of the scan-magnification factor. Figs. 4 and 5 show the average relative change with respect to the values at Msc $=1.9$ which, generally, is the most suitable compromise.
For minimum defocusing of vertical lines near the upper and lower edge of the display area, the electrode $\mathrm{g}_{8}$ should be kept at a positive voltage with respect to $\mathrm{g}_{2}$ (about 200 V with 2500 V first accelerator voltage). As this voltage also has some effect on the scan-magnification factor, both $\mathrm{g}_{8}$ and $\mathrm{g}_{9}$ should be connected to $\mathrm{g}_{2}$ when the deviation without scan magnification is being measured.

Line-width as a function of the scan-magnification factor (approximately) Line-width at $\mathrm{M}_{\mathrm{SC}}=1.9$ is $100 \%, \mathrm{I}_{\text {Screen }}=$ const.

Screen current as a function of the scan-magnification factor (approximately)
Screen current at $\mathrm{M}_{\mathrm{SC}}=1.9$ is $100 \%, \mathrm{~V}_{\mathrm{g}_{1}}=$ const.

For the adjustment of the scan-magnification factor the following procedure is recommended:
a. Set $\mathrm{V}_{8}$ and $\mathrm{V}_{9}$ to 0 with respect to $\mathrm{g}_{2}$.
b. Display a time-base line and adjust $\mathrm{V}_{\mathrm{g}_{6}}$ so that the line appears sharply focused.
c. Apply a square wave signal to the vertical deflection system (the vertical parts of the trace will be out of focus but this is immaterial) and adjust the amplitude so that the height of the display has a convenient value, e.g. 30 mm .
d. Set $\mathrm{V}_{\mathrm{g}}$ and $\mathrm{V}_{\mathrm{g} 9}$ to the appropriate values and readjust $\mathrm{V}_{\mathrm{g}_{6}}$ so that the horizontal parts of the trace are again in focus.
e. Check the height of the display (e.g. for $M_{S C}=1.9$ this height should now be 57 mm ).
$f$. If necessary, readjust $\mathrm{V}_{\mathrm{g} 9}$ until the desired value of $\mathrm{M}_{\mathrm{sc}}$ has been obtained.
Focusing is controlled by means of the electrode voltage $\mathrm{V}_{4}$ and $\mathrm{V}_{\mathrm{g}_{6}}$. The electrodes $\mathrm{g}_{5}$ and $\mathrm{g}_{7}$ can be used to centre the beam with respect to the vertical and horizontal deflection systems.
The voltages of the focusing and correction electrodes can be adjusted as follows:
a. Display a square-wave signal on the screen so that both horizontal and vertical traces are visible.
b. Adjust $\mathrm{V}_{\mathrm{g}}$ so that the horizontal parts of the display are in focus. The vertical parts will, in general, be out of focus.
c. Adjust $\mathrm{V}_{\mathrm{g}}$ so that the vertical traces are brought into focus. Now the horizontal parts of the display will be out of focus again.
d. Repeat b) and c) successively until both vertical and horizontal traces are simultaneously in focus.
e. Adjust $\mathrm{V}_{\mathrm{g}_{3}}$ for minimum width of a horizontal line. If necessary, readjust focusing voltages $\mathrm{Vg}_{4}$ and $\mathrm{V}_{6}$.
f. Adjust $\mathrm{V}_{\mathrm{g}}$ for equal brightness at the left-hand and right-hand edges of the display area. If necessary, readjust the focus by means of $\mathrm{V}_{\mathrm{g}_{6}}$.
g. Adjust $\mathrm{V}_{\mathrm{g}_{5}}$ so that the position of a horizontal trace not deflected in the vertical direction is at the centre of the vertical useful scan. If necessary, readjust the focus by means of $\mathrm{V}_{\mathrm{g}_{4}}$.
If the graticule is not fully covered by the scanned area the image should be shifted by adjusting the correction coil current (see last page) before the adjustment of $\mathrm{V}_{\mathrm{g}_{5}}$ is made.

The procedure for the adjustment of the scan-magnification factor and for focusing, as described above, seems to be rather complicated.
However, in practice it will be sufficient to adjust $\mathrm{V}_{\mathrm{g}}$ to its nominal value without determining the scan-magnification factor for each individual tube. As to focusing, the user can, with some experience, achieve the best setting with very few adjustments.

## Post-deflection acceleration

The use of a p.d.a. shield (mesh) ensures a high deflection sensitivity. A geometry control electrode, $g_{11}$, serves for the correction of pin cushion or barrel distortion of the pattern. In order to suppress background illumination due to secondary electrons originating from the p.d.a. shield $g_{12}$, this shield should be kept 12 V negative with respect to $g_{11}$ whereas the voltage of the interplate shield, $g_{10}$ should be equal to the mean $x$-plate potential.

In order to avoid damage to the side contacts the narrower end of the mu-metal screen should have an internal diameter of not less than 65 mm .

## FOCUSING electrostatic 1)

DEFLECTION double electrostatic
$x$ plates
symmetrical
The y deflection system consists of a symmetrical delay line system.
$\left.\begin{array}{lrl}\text { Characteristic impedance } & 2 \times 150 & \Omega \\ \text { Bandwidth }(-3 \mathrm{~dB}) & 800 & \left.\mathrm{MHz}{ }^{2}\right) \\ \text { Rise time } & <0.45 & \mathrm{~ns}\end{array}{ }^{3}\right)$

If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam: hence a low impedance deflection plate drive is desirable.

Angle between x and y traces
$90^{\circ} 4$ ) (see "Correction coils")

1) Because of the applications of a quadrupole lens for the magnification of the vertical deflection, two more quadrupole lenses are used for focusing. Therefore, controls for two voltages have to be provided.
${ }^{2}$ ) The band-width is defined as the frequency at which the vertical deflection sensitivity is 3 dB lower than at D.C.
${ }^{3}$ ) The rise-time is defined as the time interval between $10 \%$ and $90 \%$ of the final value of deflection when an ideal step-function signal is applied to the vertical deflection system. If the actual signal has an appreciable rise-time $\tau_{2}$, the risetime of the tube can be determined from

$$
\tau_{1}=\sqrt{\tau^{2}-\tau_{2}{ }^{2}}
$$

where $\tau$ is the rise-time observed on the display.
This should be measured after the angle between the $x$-traces and $y$-traces has been corrected by means of the correction coils, otherwise two measurements have to be taken (using either a different polarity of the vertical deflection signal or different direction of the time-base sweep) and the true value of $\tau$ has to be calculated as the arithmetic mean of the two results.
${ }^{4}$ ) Deviations from the orthogonality of traces can be eliminated by means of correction coils.

## LINE WIDTH

Measured with the shrinking raster method in the centre of the screen under typical oper ating conditions, adjusted for optimum spot size at a beam current $\mathrm{I}_{\ell}=10 \mu \mathrm{~A}$ and a screen magnification factor $\mathrm{M}_{\mathrm{Sc}}=1.9$. See also note 3 on page with "Notes".

## Notes to page 11

${ }^{1}$ ) This voltage should be adjusted for optimum pattern geometry.
2) This voltage should be equal to the mean $x$-plate potential.
3) The range indicated corresponds to a scan magnification factor, $M_{S c}$, i. e. the ratio by which the vertical deviation on the screen is increased, in the approximate range $1.8<\mathrm{M}_{\mathrm{sc}}<2.0$, and the tube should not be operated outside this range. Within this range, line width and screen current at a fixed value of the control grid voltage are increasing functions of $\mathrm{M}_{\mathrm{Sc}}$. The best compromise between brightness and line width is usually found at $\mathrm{M}_{\mathrm{Sc}} \approx 1.9$ which corresponds to $\mathrm{V}_{\mathrm{g} 9-\mathrm{g} 2} \approx 310 \mathrm{~V}$.
4) For minimum defocusing of vertical lines near the upper and lower edges of the scanned area this voltage should be adjusted approximately to the value indicated. Since the value $\mathrm{V}_{\mathrm{g} 8-\mathrm{g} 2}$ has some effect on the scan magnification factor both $\mathrm{V}_{\mathrm{g} 8}$ and $\mathrm{V}_{\mathrm{g} 9}$ should be connected to $\mathrm{g}_{2}$ when the deviation without scan magnification is to be measured.
5) This voltage should be adjusted for equal brightness in the $x$-direction with respect to the electrical centre of the tube.
7) These voltages should be stabilized to within 1 V .
8) This voltage should be adjusted for minimum width of a horizontal line.
9) For a scan magnification factor $\mathrm{M}_{\mathrm{Sc}}=1.9$. In the above mentioned range of $\mathrm{V}_{\mathrm{g} 9-\mathrm{g} 2}$ the vertical deflection factor will vary approximately $\pm 5 \%$.
10) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
11) A ractangle of $98 \mathrm{~mm} \times 58.2 \mathrm{~mm}$ is concentrically aligned with the internal graticule of the tube. With optimum corrections applied, the edges of a raster will fall between this rectangle and the boundary lines of the internal graticule.

## CORRECTIONS COILS

The tube is provided with a coil unit consisting of:

1. A pair of coils (No. 1 and 2), with approx. $220 \Omega$ resistance per coil, for
a) correction of the orthogonality of the $x$-and $y$-traces so that the angle between these traces at the centre of the screen can be made exactly $90^{\circ}$.
b) vertical shift of the scanned area.
2. A single coil (No.3) with approx. $550 \Omega$ resistance, for image rotation (alignment of the $x$-trace with the $x$-lines of the graticule).

## Orthogonality and shift

The change in the angle between the traces and the shift of the scanned area will be proportional to the algebraic sum and the algebraic difference of the currents in the coils No. 1 and 2.
Under typical operating conditions and with the coil unit closely surrounded by a mu-metal shield, the currents required are max. 5 mA per degree of angle correction and max. 2 mA per millimeter shift. The supply circuit for these coils should be so designed that in each coil a maximum current of 20 mA , with either polarity, can be produced.

If a wider mu-metal shield is used the above-mentioned values have to be multiplied by a factor $K(1<K<2)$ the value of which depends on the dimensions of the shield and approaches 2 for the case no shield is present.

## Image rotation

Under typical operating conditions, a current of max. 45 mA will be required for the alignment.

Fig. 1
With the above circuit almost independent control for shift and angle correction is achieved. This facilitates the correct adjustment to a great extent.
The dissipation in the potentiometers can be reduced considerably if the requirement of independent controls is dropped.

$P_{1}, P_{2}$ potentiometers $220 \Omega, 1$ watt: ganged
$P_{3}, P_{4}$ potentiometers $220 \Omega, 1$ watt: ganged
A further reduction of the dissipation can be obtained by providing a commutator for each coil (see circuit fig.3).
The procedure of adjustment will then become more complicated but it should be kept in mind that a readjustment is necessary only when the tube has to be replaced.

Fig. 3
$P_{1}, P_{2}$ potentiometers $220 \Omega$, 1 watt
$S_{1}, S_{2}$ commutators
A suitable circuit for the image rotating coil is given in fig. 4 .

Fig. 4
$P_{5}, P_{6}$ potentiometers $500 \Omega, 3$ watt: ganged

The following procedure of adjustment is recommended
a. Align the $x$-trace with the graticule by means of the image rotating coil.
b. With the tube fully scanned in the vertical direction, the image has to be shifted so that the graticule is fully covered. With the circuit according to fig. 1 this is done by means of the ganged potentiometers $\mathrm{P}_{1}$ and $\mathrm{P}_{4}$.
c. Adjustment of orthogonality by means of the ganged potentiometers $\mathrm{P}_{2}$ and $\mathrm{P}_{3}$. A slight readjustment of $\mathrm{P}_{1}$ and $\mathrm{P}_{4}$ may be necessary afterwards.
d. Readjustment of the image rotation if necessary.

With a circuit according to fig. 2 or 3 these corrections have to be performed by means of successive adjustments of the currents in the coils.

The most convenient deflection signal is a square wave form permitting an easy and fairly accurate visual check of orthogonality.

## ILLUMINATION OF THE GRATICULE

To illuminate the internal graticule a light conductor (e.g. of perspex) should be used. In order to achieve the most efficient light conductance, the holes for the lamps and the edge adjacent to the tube should be polished, and the distance between the perspex plate and the tube should be as small as possible. It is advisable to apply reflective material to the outer circumference and, if possible, also to the upper and lower faces of the light conductor. The thickness of the conductor should not exceed 3 mm , and its position relative to the frontplate of the tube should be adjusted for optimum illumination of the graticule lines.

## INSTUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat faced oscilloscope tube with mesh and metal backed screen.

## Notes

1. This tube is designed for optimum performance when operating at a ratio $V_{g 7}(\ell) / V_{g 2, g 4}=6,7$. The geometry electrode voltage should be adjusted within the indicated range (values with respect to the mean x-plate potential). A negative control voltage will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion and a slight increase of background light.
2. The deflection plate shield voltage should be equal to the mean $y$-plate potential. The mean $x$-plate and y-plate potentials should be equal for optimum spot quality.
3. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule, consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times 73,6 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.

## INSTRUMENT CATHODE-RAY TUBE

## NOTES

1) In order to align the $x$-trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 amp . turns for the indicated max. rotation of $5^{\circ}$ and should be positioned as indicated on the drawing.
2) This tube is designed for optimum performance when operating at a ratio
$\mathrm{V}_{\mathrm{g}_{8}(\ell)} / \mathrm{V}_{\mathrm{g}_{2}, \mathrm{~g}_{4}}=6,7$
The geometry control voltage $\mathrm{V}_{\mathrm{g}_{7}}$ should be adjusted within the indicated range (values with respect to the mean $x$-plate potential).
A negative control voltage on $g_{6}$ (with respect to the mean $x$-plate potential) will cause some pincushion distortion and less background light.
By the use of the two voltages, $\mathrm{V}_{\mathrm{g}_{6}}$ and $\mathrm{V}_{\mathrm{g}}$, it is possible to find the best com promise between background light and raster distortion.
3) The deflection plate shield voltage should be equal to the mean y-plate potential. The mean $x$ - and $y$-plate potentials should be equal for optimum spot quality.
4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
5) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
6) A graticule, consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times$ $73,6 \mathrm{~mm}$ is aligned with the electrical x axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.
${ }^{7}$ ) To avoid damage to the side contacts the narrower end of the Mu-metal shield should have an internal diameter of not less than 64 mm .

[^18]
## NOTES

1) To avoid damage to the side contacts the narrower end of the mu-metal shield should have an internal diameter of not less than 64 mm .
2) This tube is designed for optimum performance when operating at a ratio $\mathrm{V}_{\mathrm{g} 8(\ell)} / \mathrm{V}_{\mathrm{g} 2 \mathrm{~g} 4}$ $\mathrm{V}_{\mathrm{g} 8(\ell)} / \mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4}=6,7$.
The geometry control voltage $\mathrm{V}_{\mathrm{g}} 7$ should be adjusted within the indicated range (values with respect to the mean x -plate potential).
A negative control voltage on $\mathrm{g}_{6}$ (with respect to the mean x -plate potential) will cause some pincushion distortion and less background light.
By the use of two voltages, $\mathrm{V}_{\mathrm{g} 6}$ and $\mathrm{V}_{\mathrm{g} 7}$, it is possible to find the best compromise between background light and raster distortion.
If a fixed voltage on $\mathrm{V}_{\mathrm{g}} 6$ is required this voltage should be 10 V lower than the mean $x$-plate potential.
3) The deflection plate shield voltage should be equal to the mean $y$-plate potential. The mean $x$ and $y$-plate potentials should be equal for optimum spot quality.
${ }^{4}$ ) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
${ }^{5}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
4) A graticule, consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times 73,6$ mm is aligned with the electrical x -axis of the tube. With optimum corrections applied a a raster will fall between these rectangles.

## CORRECTION COILS

## General

The D14-1626H/09 is provided with a pair of coils L1 and L2 for image rotation which enable the alignment of the $x$-trace with the $x$-lines of the graticule.

The image rotation coils are wound concentrically around the tube neck.
Under typical operating conditions 50 ampere-turns are required for the maximum rotation of $5^{\circ}$. Both coils have 850 turns. This means that a current of $<30 \mathrm{~mA}$ per coil is required which can be obtained by using a 24 V supply when the coils are connected in series, or a 12 V supply when they are in parallel.

Connecting the coils
The coils have been connected to the 4 soldering tags as follows:

## INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal rectangular flat-faced oscilloscope tube with domed post-deflection acceleration mesh, sectioned y-plates, and metal-backed screen with internal graticule.

6. Measured with the shrinking raster method in the centre of the screen, with corrections adjusted for optimum spot size, at a beam current of $10 \mu \mathrm{~A}$.
7. Writing speed measuring conditions:
$\begin{array}{ll}\text { Film } & \text { Polaroid } 410(10000 \mathrm{ASA}) \\ \text { Lens } & \mathrm{F} 1 / 1,2 \\ \text { Object to image ratio } & 1 / 0,5 \\ \text { Modulation } & \Delta \mathrm{V}_{\mathrm{g} 1}=55 \mathrm{~V}\end{array}$
8. The deflection coefficient over each division will not differ more than $5 \%$ from that over any other division; all these deflection coefficients being measured per division along the axes.
9. A graticule consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times 73,6 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.

## CORRECTION COILS

On request a correction coil unit can be made available consisting of

1. a pair of coils L1 and L2 which enable the angle between the x and y traces at the centre of the sceen to be made exactly $90^{\circ}$ (orthogonality correction).
2. a pair of coils L3 and L4 which enable the scanned area to be shifted up and down (vertical shift).
3. a coil $L 5$ for image rotation which enables the alignment of the $x$ trace with the $x$ lines of the graticule.

Orthogonality (coils L1 and L2)
The current required under typical operating conditions with mu-metal shield being used is $<8 \mathrm{~mA}$ for complete correction of orthogonality.
The resistance of each coil is $\approx 160 \Omega$.

## Shift (coils L3 and L4)

The current required under typical operating conditions with mu-metal shield being used is $<12 \mathrm{~mA}$ for a maximum shift of 5 mm .
The resistance of each coil is $\approx 160 \Omega$.

Image rotation (coil L5)
The image rotation coil is wound concentrically around the tube neck. Under typical operating conditions 27 ampere-turns are required for the maximum rotation of $5^{\circ}$. The coil has 1560 turns. This means that a current of $<18 \mathrm{~mA}$ is required. The resistance of the coil is $\approx 185 \Omega$.

## NOTES

1. The mean $x$-plate potential and the mean $y$-plate potential should be equal to $V_{g 2, g 4, g 5(\ell)}$ (with astigmatism control voltage set to zero).
2. When putting the tube into operation the astigmatism control voltage should be adjusted only once for optimum spot size in the centre of the screen. The control voltage will be within the stated range, provided the conditions of note 1 are adhered to.
3. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.

As the construction of the tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, g 4, g 5(\ell)}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but without raster, the deflection plate voltages should be changed to: $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=1300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1700 \mathrm{~V}$, thus directing the total beam current to $\mathrm{x}_{2}$. Measure the current on $x_{2}$ and adjust $V_{g 1}$ for $I_{x 2}=10 \mu \mathrm{~A}$.
c) set again for the conditions under a), without touching the $V_{g 1}$ control. The screen current of the resulting raster display is now $10 \mu \mathrm{~A}$.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times 73 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.

* The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the $x$-trace with the mechanical $x$-axis of the screen. The coil has 1000 turns and a resistance of max. $400 \Omega$. Under typical operating conditions, max. 30 ampere-turns are required for the max. rotation of $5^{0}$. This means the required current is max. 30 mA at a required voltage of max. 12 V .

## Notes to the drawings on opposite page.

1. The bulge at the frit seal may increase the indicated maximum dimensions by not more than 2 mm .
2. The coil is fixed to the envelope by means of adhesive tape.
3. The centre of the contact is situated within a square of $10 \mathrm{~mm} \times 10 \mathrm{~mm}$ around the true geometrical position.
4. The length of the connecting leads of the rotation coil is $\mathbf{m i n} .350 \mathrm{~mm}$.

## NOTES

1. The interplate shield voltage should be equal to the mean $x$-plate potential. The mean $x$-plate and $y$-plate potentials should be equal for optimum spot quality.
2. The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
3. The tube is designed for optimum performance when operating at a ratio $V_{g 7}(\ell) / V_{g 2, g 4}=2$. If this ratio is smaller than 2, the useful scan may be smaller than $100 \mathrm{~mm} \times 80 \mathrm{~mm}$.
4. Measured with the shrinking raster method in the centre of the screen with corrections adjusted for optimum spot size, at a beam current of $10 \mu \mathrm{~A}$.
5. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
6. A graticule consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times 73 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum corrections applied, the edges of a raster will fall between these rectangles.

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and vertical eccentricity calibration. Correction is obtained at $\mathrm{V}_{\mathrm{g} 2}=1800$ to 2200 V ; optimum at $\mathrm{V}_{\mathrm{g} 2}=2000 \mathrm{~V}$.
3. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $180 \Omega$ at $20^{\circ} \mathrm{C}$ (max. $270 \Omega$ at $80^{\circ} \mathrm{C}$ ). Approx. 5 mA causes $1^{\circ}$ trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances ( $\pm 5^{\circ}$ ) and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).
4. The mean $x$-plate potential should be equal to $\mathrm{V}_{\mathrm{g} 2}$. A deviation may lead to raster distortion beyond the indicated range (see note 8).
5. Deviation of mean y-plate potential with respect to $\mathrm{V}_{\mathrm{g} 2}$ will introduce astigmatism (as without internal magnetic correction). The grid 2 impedance should be less than $10 \mathrm{k} \Omega$.
6. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.
7. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
8. A graticule consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and $93 \mathrm{~mm} \times 73 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.

## INSTRUMENT CATHODE-RAY TUBES

- mono accelerator
- 14 cm diagonal rectangular flat face
- internal magnetic lens system for vertical scan magnification, orthogonality, astigmatism and eccentricity correction
- low heater consumption
- with or without internal graticule
- flat screen edges facilitate graticule illumination
- reference points on faceplate for graticule alignment
- for inexpensive oscilloscopes and read-out devices

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; asymmetric drive introduces trace distortion. It is recommended that the tube be operated with equal mean $x$ - and y-potentials, in order to minimize tube adjustments. Under this condition $g_{5}$ can be connected to $\mathrm{g}_{2}, \mathrm{~g}_{4}$, and made equal to mean y-potential for optimum spot (see also notes 3 and 4).
A difference between mean $x$ - and $y$-potentials up to 75 V is permissible, however this may influence the specified deflection coefficients, and a separate voltage on $g_{5}$ (equal to mean $x$-potential) may be required.
3. The tube meets the geometry specification (see note 8 ) if $\mathrm{V}_{\mathrm{g} 5}$ is equal to mean $x$-potential. A range of $\pm 50 \mathrm{~V}$ around mean $x$-potential may be applied for further correction.
4. Optimum spot is obtained with $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4}$ equal to mean y-potential (see note 2). In general a tolerance of $\pm 4 \mathrm{~V}$ has no visible effect; $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4}$ tends to be lower with $\mathrm{V}_{\mathrm{g} 5}$ more positive. The circuit impedance $R_{g 2, g 4}$ should be less than $10 \mathrm{k} \Omega$.
5. An actual focus range of 30 V should be provided on the front panel. $\mathrm{V}_{\mathrm{g} 3}$ decreases with increasing grid drive (see also Fig. 5).
6. Intensity control on the front panel should be limited to the maximum useful screen current (approx. $50 \mu \mathrm{~A}$; see also Fig. 5). It is to be adjusted either by the grid drive (up to 22 V ) or for maximum acceptable line width. The corresponding cathode current or $\mathrm{I}_{\mathrm{g} 2, \mathrm{~g} 4}$ (up to $500 \mu \mathrm{~A}$ ) depend on the cut-off voltage and cannot be used for control settings.
7. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
8. A graticule consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 78 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
9. The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration.
10. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of $185 \pm 25 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. Approx. 5 mA causes 10 trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances $\left( \pm 5^{\circ}\right)$ and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).
11. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.

Fig. 5 Screen current ( $l_{\text {screen }}$ ) and focusing voltage ( $\mathrm{V}_{\mathrm{g} 3}$ ) as a function of grid drive voltage $\left(\mathrm{V}_{\mathrm{d}}\right)$; typical curves.

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; asymmetric drive introduces trace distortion. It is recommended that the tube be operated with equal mean $x$ - and $y$-potentials, in order to minimize tube adjustments. Under this condition g5 can be connected to $\mathrm{g} 2, \mathrm{~g} 4$, and made equal to mean y-potential for optimum spot (see also notes 3 and 4).
A difference between mean $x$ - and $y$-potentials up to 75 V is permissible, however this may influence the specified deflection coefficients, and a separate voltage on $\mathrm{g}_{5}$ (equal to mean x-potential) may be required.
3. The tube meets the geometry specification (see note 8) if $\mathrm{V}_{\mathrm{g} 5}$ is equal to mean $x$-potential. A range of $\pm 30 \mathrm{~V}$ around mean x-potential may be applied for further correction.
4. Optimum spot is obtained with $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4}$ equal to mean y-potential (see note 2). In general a tolerance of $\pm 4 \mathrm{~V}$ has no visible effect; $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4}$ tends to be lower with $\mathrm{V}_{\mathrm{g} 5}$ more positive. The circuit impedance $R_{g 2, g 4}$ should be less than $10 \mathrm{k} \Omega$.
5. An actual focus range of 30 V should be provided on the front panel. $\mathrm{V}_{\mathrm{g} 3}$ decreases with increasing grid drive (see also Fig. 5).
6. Intensity control on the front panel should be limited to the maximum useful screen current (approx. $50 \mu \mathrm{~A}$; see also Fig. 5). It is to be adjusted either by the grid drive (up to 22 V ) or for maximum acceptable line width. The corresponding cathode current or $\mathrm{I}_{\mathrm{g} 2, \mathrm{~g} 4}$ (up to $500 \mu \mathrm{~A}$ ) depend on the cut-off voltage and cannot be used for control settings.
7. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
8. A graticule consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 78 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
9. The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration.
10. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of $185 \pm 25 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. Approx. 5 mA causes $1^{0}$ trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances $\left( \pm 5^{\circ}\right)$ and earth magnetic field with reasonable shielding $\left( \pm 2^{\circ}\right)$.
11. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.

$R_{g 1} \quad \max . \quad 1 \mathrm{M} \Omega$

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; floating mean $x$ - or $y$-potentials will result into non-uniform line width and geometry distortion. The mean $x$ - and $y$-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry.

The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean $x$-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case $\mathrm{V}_{\mathrm{g} 5}$ must be made equal to mean x-potential, and a range of 0 to --25 V with respect to mean $y$-potential will be required on $g 4$ for astigmatism correction. The circuit resistance for $\mathrm{V}_{\mathrm{g} 4}$ should be $\leqslant 10 \mathrm{k} \Omega$.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 78 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $185 \pm 25 \Omega$ at $0^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. Approx. 6,5 mA causes 10 trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances $\left( \pm 5^{\circ}\right)$ and earth magnetic field with reasonable shielding $\left( \pm 2^{\circ}\right)$.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.
8. The X-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, when the tube is used within its limiting values (beam current $I_{\ell} \leqslant 100 \mu \mathrm{~A}$ ).

## INSTRUMENT CATHODE-RAY TUBE

- 14 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- low heater consumption
- internal graticule
- high sensitivity and high brightness
- short overall length
- for compact oscilloscopes with up to 75 MHz bandwidth

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 4).
2. The deflection plates must be operated symmetrically; floating mean $x$ - or $y$-potentials will result into non-uniform line width and geometry distortion. The mean $x$ - and $y$-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry. A range of $\Delta \mathrm{V}_{\mathrm{g} 5}=-50$ to +50 V may be applied for pincushion/barrel correction. The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean x-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case $\mathrm{V}_{\mathrm{g} 5}$ must be made equal to mean x-potential, and a range of 0 to -25 V with respect to mean $y$-potential will be required on $g 4$ for astigmatism correction. The circuit resistance for $\mathrm{V}_{\mathrm{g} 4}$ should be $\leqslant 10 \mathrm{k} \Omega$.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 78 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $185 \pm 25 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. At typical operation ( $\mathrm{V}_{\mathrm{g} 5}=2200 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 7}=16,5 \mathrm{kV}$ ) approx. $6,5 \mathrm{~mA}$ causes 10 trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances ( $\pm 5^{\circ}$ ) and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).
The required current for 10 trace rotation is related to approx. $\sqrt{V}_{g 5}$.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.

Fig. 5 Beam current ( $I_{\mathrm{bx}}$ ) and focusing voltage ( $\mathrm{V}_{\mathrm{g} 3}$ ) as a function of grid drive voltage ( $\mathrm{V}_{\mathrm{d}}$ ) at $\mathrm{V}_{\mathrm{g} 7}=16,5 \mathrm{kV}, \mathrm{V}_{\mathrm{g} 5}=2,2 \mathrm{kV}$; typical curves.
$I_{b x}$ is the beam current, without scan, measured on $\times 2$, when the deflection plate potentials have been adjusted to $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2200 \mathrm{~V}, \mathrm{~V}_{\mathrm{x} 1}=1500 \mathrm{~V}, \mathrm{~V}_{\mathrm{x} 2}=1900 \mathrm{~V}$, thus directing the total beam current to $\times 2$.

Fig. $60,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curve, measured according to TEPAC104.

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 5).
2. The deflection plates must be operated symmetrically; floating mean $x$ - or $y$-potentials will result into non-uniform line width and geometry distortion. The mean $x$ - and $y$-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry.

The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean $x$-potential up to 50 V positive with respect to mean y-potential is inevitable. In this case $\mathrm{V}_{\mathrm{g} 5}$ must be made equal to mean x-potential, and a range of 0 to -25 V with respect to mean $y$-potential will be required on $g 4$ for astigmatism correction. The circuit resistance for $\mathrm{V}_{\mathrm{g} 4}$ should be $\leqslant 10 \mathrm{k} \Omega$.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 78 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $185 \pm 25 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. Approx. $6,5 \mathrm{~mA}$ causes 10 trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances $\left( \pm 5^{\circ}\right)$ and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.
8. The $X$-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, when the tube is used within its limiting values (beam current $I_{\ell} \leqslant 100 \mu \mathrm{~A}$ ).

## INSTRUMENT CATHODE-RAY TUBE

- 14 cm diagonal rectangular flat face
- domed mesh post-deflection acceleration
- internal magnetic lens system for correction of orthogonality, astigmatism and eccentricity
- low heater consumption
- side contacts to deflection plates
- internal graticule
- high sensitivity and high brightness
- short overall length
- for compact oscilloscopes with up to 150 MHz bandwidth

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 5).
2. The deflection plates must be operated symmetrically; floating mean $x$ - or $y$-potentials will result into non-uniform line width and geometry distortion. The mean $x$ - and $y$-potentials should be equal; under this condition the tube will be within the specification without corrections for astigmatism and geometry. A range of $\Delta \mathrm{V}_{\mathrm{g} 5}=-50$ to +50 V may be applied for pincushion/barrel correction. The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration.
3. For some applications a mean $x$-potential up to 50 V positive with respect to mean $y$-potential is inevitable. In this case $\mathrm{V}_{\mathrm{g} 5}$ must be made equal to mean x -potential, and a range of 0 to -25 V with respect to mean $y$-potential will be required on $g 4$ for astigmatism correction. The circuit resistance for $\mathrm{V}_{\mathrm{g} 4}$ should be $\leqslant 10 \mathrm{k} \Omega$.
4. The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5. A graticule consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 78 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
6. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $185 \pm 25 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. At typical operation ( $\mathrm{V}_{\mathrm{g} 5}=2200 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 7}=16,5 \mathrm{kV}$ ) approx. $6,5 \mathrm{~mA}$ causes 10 trace rotation. Thus maximum required voltage is approx. 13 V for tube tolerances ( $\pm 5^{\circ}$ ) and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).
The required current for 10 trace rotation is related to approx. $\sqrt{\mathrm{V}}_{\mathrm{g} 5}$.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $\mathrm{I}_{\ell}=10 \mu \mathrm{~A}$.

Fig. 6 Beam current ( $\mathrm{l}_{\mathrm{bx}}$ ) and focusing voltage $\left(\mathrm{V}_{\mathrm{g} 3}\right)$ as a function of grid drive voltage $\left(\mathrm{V}_{\mathrm{d}}\right)$; typical curves.
$I_{b x}$ is the boam current, without scan, measured on $\times 2$, when the deflection plate potentials have boen adjusted to $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2200 \mathrm{~V}, \mathrm{~V}_{\mathrm{x} 1}=1500 \mathrm{~V}, \mathrm{~V}_{\mathrm{x} 2}=1900 \mathrm{~V}$, thus directing the total begm current to $\times 2$.

Fig. $70,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curve, measured according to TEPAC104.

Fig. 6 Focusing voltage ( $\mathrm{V}_{\mathrm{g} 3}$ ) as a function of grid drive voltage ( $\mathrm{V}_{\mathrm{d}}$ ); typical curve.

Fig. $70,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curve, measured according to EIA standard RS-502 (formerly TEPAC104).

## NOTES

1. As the frit seal is visible through the faceplate, and not necessarily aligned with the internal graticule, application of an external passe-partout with open area of max. $102 \mathrm{~mm} \times 82 \mathrm{~mm}$ is recommended. The internal graticule is aligned with the faceplate by using the faceplate reference points (see Fig. 5).
2. The tube features internal magnetic correction for orthogonality between $x$ - and $y$-traces, spot shaping (astigmatism) and eccentricity calibration. Correction is obtained at $\mathrm{V}_{\mathrm{g} 2-1, \mathrm{~g} 4}=2500$ to 3300 V ; optimum at $\mathrm{V}_{\mathrm{g} 2-1, \mathrm{~g} 4}=3000 \mathrm{~V}$.
3. For some applications a mean x-potential up to 50 V positive with respect to mean $y$-potential is inevitable. In this case $\mathrm{V}_{\mathrm{g} 5}$ must be made equal to mean $x$-potential, and a range of 0 to -50 V with respect to mean $y$-potential will be required on g 4 for astigmatism correction. The circuit resistance for $\mathrm{V}_{\mathrm{g} 4}$ should be $\leqslant 10 \mathrm{k} \Omega$.
4. Deviation of mean y-plate potential with respect to $\mathrm{V}_{\mathrm{g} 2-1}$ will introduce spot distortion.
5. Deviation of linearity is defined as the proportional deviation of the deflection coefficient over any division on the $x$-axis and $y$-axis from the average values over the central eight (horizontal) and central six (vertical) divisions respectively.
6. A graticule consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 78 \mathrm{~mm}$ is aligned with the internal graticule. With optimum trace rotation correction the edges of a raster will fall between these rectangles.
7. The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a resistance of $185 \pm 20 \Omega$ at $20^{\circ} \mathrm{C}$, which increases by approx. $0,4 \% / \mathrm{K}$ for rising temperature. Approx. 6,7 mA causes 10 trace rotation.
8. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A}$.

## NOTES

1) In order to align the $x$-trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 amp. furns for the indicated max. rotation of $5^{\circ}$ and should be positioned as indicated in the drawing.
2) This tube is designed for optimum performance when operating at a ratio $\mathrm{V}_{\mathrm{g}_{7}} / V_{\mathrm{g}_{9}, g_{4}}=5$.
 with reipect to the mean $x$-plate potential).
A negative controi voltage will cause some pincushion distortion andiess background light, a positive control voltage will give some barrel distortion and a slight increaso of background light.
3) The deflection plate shield voltage should be equal to the mean y-plate potential. The mean $x$ - and $y$-plate potentials should be equal for optimum spot quality.
4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range,
5) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a dellection of $25 \%$ of the useful scan by more than the indicated value.
6) A graticule, consisting of concentric rectangles of $115 \mathrm{~mm} \times 95 \mathrm{~mm}$ and $112,2 \mathrm{~mm} \times 93.0 \mathrm{~mm}$ is aligned with the electrical x -axis of the tube, with optimum correction potentials applied, a raster will fall between these rectangles.

## NOTES

${ }^{1}$ ) This tube is designed for optimum performance when operating at a ratio $\mathrm{V}_{\mathrm{g} 7(\ell)} / \mathrm{V}_{\mathrm{g} 2, \mathrm{~g}_{4}}=6,7$.
The geometry coutrol voltage $\mathrm{V}_{\mathrm{g}}$ should be adjusted within the indicated range (values with respect to the mean x -plate potential).
${ }^{2}$ ) A negative control voltage on $g_{5}$ (with respect to the mean $x$-plate potential) will cause some pincushion distortion and less background light. By varying the two voltages $\mathrm{V}_{5}$ and $\mathrm{V}_{6}$ it is possible to find the best compromise between background light and raster distortion.
${ }^{3}$ ) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
${ }^{4}$ ) The sensitivity at a deflection less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5) A graticule, consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and $96 \mathrm{~mm} \times$ 77 mm is aligned with the electrical x -axis of the tube. With optimum correction potentials applied a raster of each system will fall between these rectangles.

## E14-100GH

## CORRECTION COILS

## General

The E14-100GH is provided with a pair of coils for image rotation which enable the alignment of the $x$-trace with the $x$-lines of the graticule.

The image rotating coils are wound concentrically around the tube neck. Under typical operating conditions 50 A turns are required for the maximum rotation of $5^{\circ}$. Both coils have 850 turns. This means that a current of max. 30 mA per coil is required which can be obtained by using a 24 V supply when the coils are connected in series, or a 12 V supply when they are in parallel.

## Connecting the coils

The coils have been connected to the 4 soldering tags as follows:

## BEAM CENTRING MAGNET

Inherent to the split-beam system a slight difference between the two beam currents can occur after splitting, resulting in different intensities of the two traces. In order to equalize the beam currents, a beam centring magnet should be mounted near the base of the gun and adjusted for the required field direction and field strength.

## INSTRUMENT CATHODE-RAY TUBE

The E14-101GH is equivalent to the E14-100GH but has no rotating coil.

## INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat-faced direct-view storage tube with variable persistence and internal graticule, intended for oscilloscope applications.

## NOTES

1. These values are valid at cut-off of both flood guns and the writing gun. The H.T. unit must be capable of supplying $0,5 \mathrm{~mA}$. To protect the tube against excessive surge current during erasure, an adequately dimensioned RC-network must be connected in series with the screen terminal lead (Fig. 8).

Fig. 8.
2. This voltage should be equal to the mean y-plate potential. The mean $x$ and $y$-plate potentials should be equal for optimum spot quality.
3. The collimator electrode voltage should be adjusted for optimum uniformity of background illumination.
4. The voltage $\mathrm{V}_{\mathrm{g} 2}{ }^{\prime}, \mathrm{V}_{\mathrm{g} 2}{ }^{\prime \prime}$ should be equal to the mean $x$-plate potential.
5. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{b}=10 \mu \mathrm{~A}$ (measured against $x$-plates).
6. The writing speed is defined as the maximum speed at which a written trace is just visible, starting from a background which is just black. The indicated value is guaranteed for the total graticule area, with the exception of maximum $5 \%$ in each corner. The writing speed can be increased to approx. $2,5 \mathrm{div} / \mu \mathrm{s}$ if some background is tolerated.
7. The storage time is defined as the time required for the brightness of the unwritten background to rise from just zero brightness (viewing-beam cut-off) to $10 \%$ of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased.
8. The sensitivity at a deflection less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
9. A graticule, consisting of concentric rectangles of $88 \mathrm{~mm} \times 70 \mathrm{~mm}$ and $86 \mathrm{~mm} \times 68,5 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.

## CORRECTION COILS

## General

The L14-111GH/55 is provided with a coil unit (see Fig. 9) consisting of:

- a pair of coils L3 and L4 which enable the angle between the $x$ and $y$-traces at the centre of the screen to the made exactly $90^{\circ}$ (orthogonality correction);
- a pair of coils L1 and L2 for image rotation which enable the alignment of the $x$-trace with the $x$-lines of the graticule.

Fig. 9 Diagram of coil unit.
Orthogonality (coils L3 and L4)
The current required under typical operating conditions without a mu-metal shield being used is max. 20 mA for complete correction of orthogonality. It will be $30 \%$ to $50 \%$ lower with shield, depending on the shield diameter. The resistance of the coil is approx. $225 \Omega$.

## Image rotation (coils L1 and L2)

The image rotation coils are wound concentrically around the tube neck. Under typical operating conditions 22 ampere-turns are required for maximum rotation of $5^{\circ}$. Both coils have 850 turns. This means that a current of max. $12,5 \mathrm{~mA}$ per coil is required which can be obtained by using a 12 V supply when the coils are connected in series or a 6 V supply when they are in parallel.

## Connecting the coils

The coils have been connected to 8 solder tags according to Fig. 10.

Fig. 10 Bottom view.
With L3 and L4 connected in series according to Fig. 11 a current in the direction indicated will produce a clockwise rotation of the vertical trace and an anti-clockwise rotation of the horizontal trace.

Fig. 11.

## OPERATING NOTES

## Modes of operation

Store mode
a. Dynamic erasure (variable persistence)

Dynamic erasure can be achïeved by applying erasing pulses of positive polarity to the backing electrode. The pulse amplitude required is approximately $9 \mathrm{~V}(<15 \mathrm{~V})$ and the persistence of a stored display can be controlled by varying the duty factor of these pulses.
b. Static erasure.

If no dynamic erasing pulses are applied, the storage time is limited by the potential shift of the storage layer due to landing of positive ions. In order to erase a stored display, the backing electrode should first be connected to the collector electrode voltage and then returned to its original potential for about 100 ms ; after that, an erasing pulse of positive polarity and a duration of not less than 300 ms should be applied. For the adjustment of the amplitude of this pulse see Procedure of adjustment.

## Non-store mode

For non-store operation, it is sufficient to make the backing electrode about 35 V negative with respect to the viewing gun cathodes. The viewing guns should not be switched off in this mode of 1)peration since slight variations in raster geometry and deflection sensitivity might otherwise be caused. Care should be taken, especially when switching from store mode to non-store mode, that excessive writing beam current is avoided, as otherwise the storage layer may be damaged.

## Procedure of adjustment

a. Adjust the cathode current of each viewing gun to $0,4 \mathrm{~mA}$ by means of its control grid voltage.
b. Adjustment of the erasing pulse amplitude (static erasure)

The pulse amplitude should be just sufficient to suppress any background illumination at the centre of the display area ( this adjustment should be done under low ambient light conditions). Data on storage time and maximum writing speed are based on erasure to "just black". A larger pulse amplitude (erasure to "blacker than black") yields a longer storage time at the expense of maximum writing speed. On the other hand, writing speed can be increased if some background illumination is tolerated. To erase to "just black" the amplitude of this pulse is approximately 9 V .
c. Adjustment of the collimator voltage

With dynamic erasing pulses applied and a persistence control setting that yields a convenient background illumination intensity, the collimator voltage is adjusted for optimum background uniformity. This voltage will be approximately 80 V with respect to the viewing gun cathode potential. If this voltage is too high or too low, there is a decrease of intensity at the four corners or at the centres of the vertical edges of the display area respectively. For a good erasure of the display, the collimator voltage should be as low as possible.

## INSTRUMENT CATHODE-RAY TUBE

14 cm -diagonal rectangular flat-faced direct-view storage tube with split-beam writing gun, variable persistence and internal graticule, intended for oscilloscope applications.

QUICK REFERENCE DATA

| Final accelerator voltage | $V_{\mathrm{g} 10}(\ell)$ | $8,5 \mathrm{kV}$ |

| $I_{f}^{\prime \prime}$ | 300 mA |

## MECHANICAL DATA

## Mounting position

any
The tube should not be supported by the base alone and under no circumstances should the socket be allowed to support the tube. The tags near the screen should not be subjected to mechanical stress.

| Net mass | approx. $\quad 1,1 \mathrm{~kg}$ |
| :---: | :---: |
| Base | 14 pin, all glass |
| Dimensions and connections |  |
| See also outline drawing |  |
| Overall length (socket included) | max. 445 mm |
| Face dimensions | max. $100 \times 120 \mathrm{~mm}$ |
| Accessories |  |
| Socket (supplied with tube) | type 55566 |
| Side contact connector (16 required) | type 55561 |
| Small ball contact connector (3 required) | type 402210221590 |
| FOCUSING | electrostatic |
| DEFLECTION | double electrostatic |
| x-plates | symmetrical |
| $y$-plates | symmetrical |

If use is made of the full deflection capabilities of the tube, the deflection plates will block part of the electron beams, hence a low impedance deflection plate drive is desirable.
Angle between $x$ and $y$ traces, each beam $90^{\circ}$
Angle between $x$-trace and $x$-axis of the internal graticule $0^{\circ}$
Angle between corresponding $y$-traces at the centre of the screen 45'

## NOTES

1. These values are valid at cut-off of both viewing (flood) guns and the writing gun. The H.T. unit must be capable of supplying $0,5 \mathrm{~mA}$. To protect the tube against excessive surge current during erasure, an adequately dimensioned RC-network must be connected in series with the screen terminal lead (Fig. 8).

Fig. 8.
2. This voltage should be equal to the mean $y$-plate potential. The mean $x$ and $y$-plate potentials should be equal for optimum spot quality.
3. The collimator electrode voltage should be adjusted for optimum uniformity of background ilfumination.
4. The voltage $\mathrm{V}_{\mathrm{g} 2^{\prime}}, \mathrm{V}_{\mathrm{g} 2^{\prime \prime}}$ should be equal to the mean x-plate potential.
5. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{b}=5 \mu \mathrm{~A}$ per system (measured against x-plates).
6. The writing speed is defined as the maximum speed at which a written trace is just visible, starting from a background which is just black. The indicated value is guaranteed for the total graticule area, with the exception of maximum $5 \%$ in each corner. The writing speed can be increased to approx. $1,25 \mathrm{div} / \mu \mathrm{s}$ if some background is tolerated.
7. The storage time is defined as the time required for the brightness of the unwritten background to rise from just zero brightness (viewing-beam cut-off) to $10 \%$ of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased.
8. The sensitivity at a deflection less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
9. A graticule, consisting of concentric rectangles of $88 \mathrm{~mm} \times 70 \mathrm{~mm}$ and $84,8 \mathrm{~mm} \times 67,6 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.

## CORRECTION COILS

## General

The L14-131GH/55 is provided with a coil unit (see Fig. 9) consisting of:

1. A pair of coils L3 and L4 which enable the angle between the $x$ and $y$-traces at the centre of the screen to be made exactly $90^{\circ}$ (orthogonality correction).
2. A pair of coils L1 and L2 for image rotation which enable the alignment of the $x$-trace with the $x$-lines of the graticule.

Fig. 9 Diagram of coil unit.

## Orthogonality (coils L3 and L4)

The current required under typical operating conditions without a mu-metal shield being used is max. 20 mA for complete correction of orthogonality. It will be $30 \%$ to $50 \%$ lower with shield, depending on the shield diameter. The resistance of the coil is approx. $225 \Omega$.

## Image rotation (coils L1 and L2)

The image rotation coils are wound concentrically around to the tube neck. Under typical operating conditions 22 ampere-turns are required for maximum rotation of $5^{\circ}$. Both coils have 850 turns. This means that a current of max. $12,5 \mathrm{~mA}$ per coil is required which can be obtained by using a 12 V supply when the coils are connected in series or a 6 V supply when they are in parallel.

## Connecting the coils

The coils have been connected to 8 solder tags according to Fig. 10.

Fig. 10 Bottom view.
With L3 and L4 connected in series according to Fig. 11 a current in the direction indicated will produce a clockwise rotation of the vertical trace and an anti-clockwise rotation of the horizontal trace.

Fig. 11.

## BEAM CENTRING MAGNET

Inherent to the split-beam system a slight difference between the two beam currents can occur after splitting, resulting in different intensities of the two traces. In order to equalize the beam currents, a beam centring magnet should be mounted near the base of the gun and adjusted for the required field direction and field strength.

## OPERATING NOTES

## Modes of operation

Store mode
a. Dynamic erasure (variable persistence).

Dynamic erasure can be achieved by applying erasing pulses of positive polarity to the backing electrode. The pulse amplitude required is approximately $9 \mathrm{~V}(<15 \mathrm{~V})$ and the persistence of a stored display can be controlled by varying the duty factor of these pulses.
b. Static erasure.

If no dynamic erasing pulses are applied, the storage time is limited by the potential shift of the storage layer due to landing of positive ions. In order to erase a stored display, the backing electrode should first be connected to the collector electrode voltage and then returned to its original potential for about 100 ms ; after that, an erasing pulse of positive polarity and a duration of not less than 300 ms should be applied. For the adjustment of the amplitude of this pulse see Procedure of adjustment.

## Non-store mode

For non-store operation, it is sufficient to make the backing electrode about 35 V negative with respect to the viewing gun cathodes. The viewing guns should not be switched off in this mode of operation since slight variations in raster geometry and deflection sensitivity might otherwise be caused. Care should be taken, especially when switching from store mode to non-store mode, that excessive writing beam current is avoided, as otherwise the storage layer may be damaged.

## Procedure of adjustment

a. Adjust the cathode current of each viewing gun to $0,4 \mathrm{~mA}$ by means of its control grid voltage.
b. Adjustment of the erasing pulse amplitude (static erasure)

The pulse amplitude should be just sufficient to suppress any background illumination at the centre of the display area (this adjustment should be done under low ambient light conditions). Data on storage time and maximum writing speed are based on erasure to "just black". A larger pulse amplitude (erasure to "blacker than black") yields a longer storage time at the expense of maximum writing speed. On the other hand, writing speed can be increased if some background illumination is tolerated. To erase to "just black" the amplitude of this pulse is approximately 9 V .
c. Adjustment of the collimator voltage.

With dynamic erasing pulses applied and a persistence control setting that yields a convenient background illumination intensity, the collimator voltage is adjusted for optimum background uniformity. This voltage will be approximately 80 V with respect to the viewing gun cathode potential. If this voltage will be approximately 80 V with respect to the viewing gun cathode potential. If this voltage is too high or too low, there is a decrease of intensity at the four corners or at the centres of the vertical edges of the display area respectively.

## INSTRUMENT CATHODE-RAY TUBE

14 cm diagonal, rectangular flat-faced direct-view charge transfer storage tube with internal graticule. The tube has vertical scan-magnification with 3 quadrupole lenses and is for wide-band ( 100 MHz ) oscilloscopy with fast store mode and variable persistence.

## NOTES

1. Because of the use of a quadrupole lens for the magnification of the vertical deflection, two more quadrupole lenses are used for focusing. Therefore, controls for two voltages have to be provided.
2. The tube has a rotation coil, concentrically wound around the tube neck, to allow alignment of the $y$-trace with the mechanical $y$-axis of the screen. The coil has 2000 turns and a maximum resistance of $650 \Omega$. Under typical operating conditions, a maximum of 30 ampere-turns is required for the maximum rotation of $5^{\circ}$. This means the required supply is 15 mA maximum at 12 V maximum.

max. write: $\geqslant 15 \mathrm{~s}$
Fast-store mode
max. write: $\geqslant 15 \mathrm{~s}$

## NOTES

1. These values are valid at cut-off of both flood guns and the writing gun. The H.T. unit must be capable of supplying $0,5 \mathrm{~mA}$. To protect the tube against excessive surge current during erasure, an RC-network as shown in Fig. 7 must be connected in series with the screen terminal lead; the resistance of 15 to $20 \mathrm{M} \Omega$ includes the internal resistance of the H.T. supply.

Fig. 7.
2. This voltage should be adjusted for equal brightness in the $x$-direction with respect to the electrical centre of the tube.
3. For minimum defocusing of vertical lines near the upper and lower edges of the scanned area this voltage should be the value indicated.
4. The indicated values concern the d.c. levels; during the erasing, preparing and transfering operation these electrodes are pulsed.
5. The sensitivity at a deflection less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
6. A graticule, consisting of concentric rectangles of $90 \mathrm{~mm} \times 72 \mathrm{~mm}$ and $87,8 \mathrm{~mm} \times 70,5 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.
7. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $\mathrm{I}_{\mathrm{b}}=10 \mu \mathrm{~A}$ (measured against x-plates).

## NOTES (continued)

8. The writing speed is defined as the maximum speed at which a written trace is just visible starting from a background which is just black. The indicated value is guaranteed for the central $80 \%$ of the minimum screen area, except the outmost 3 mm of the screen. However, in any corner not more than 4 square divisions fall outside the guaranteed area. The writing speed can be increased, if some background is tolerated. Within the same area, a trace, written with the indicated value of max. write, remains just visible within the indicated storage time of max. write.
The writing speed in max. write, with background, is defined as the maximum speed at which the written trace remains just visible within the indicated storage time.
9. The storage time in just black mode is defined as the time required for the brightness of the unwritten background to rise from zero brightness (viewing beam cut-off) to $10 \%$ of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased. The storage time in max. write and fast is related to the writing speed.

## OPERATING NOTES

## Scan magnifier

A scan magnification $M_{S C} \approx 1,8$ is the best compromise between line width and sensitivity. This is obtained with $V_{g 7}=-600 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{g} 4}=200 \mathrm{~V}$. Performance is tested and specified under this condition and no adjustment will be necessary for individual tubes.

Focusing is separate for horizontal and vertical directions with $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 5}$ respectively. Both focus settings may depend on beam current with different steepness. Although both electrodes are positive with respect to cathode, reverse current may result from secondary electrons leaving grid 3 (max. $5 \mu \mathrm{~A}$ ) and grid 5 (max. $50 \mu \mathrm{~A}$ ).
Normal current direction from beam interception is to be expected on the horizontal correction electrode $\mathrm{g}_{6}$ (up to $500 \mu \mathrm{~A}$ ) and, as usual, on $\mathrm{g}_{2}$ and deflection plates.

## Modes of operations

## Non-store mode

For non-store operation the front mesh $\mathrm{V}_{\mathrm{g} 12}$ is set to -50 V with respect to FGK.
The viewing guns should not be switched off in this mode of operation since slight variations in raster geometry and deflection sensitivity might otherwise be caused. Care should be taken, especially when switching from store mode to non-store mode, that excessive writing beam current is avoided, as otherwise the storage layer may be damaged.

## Variable persistence mode

The fast mesh is switched off for this operation and used as collector by setting $\mathrm{V}_{\mathrm{g} 11}=140 \mathrm{~V}$.
a. Static erasure

If no dynamic erasing pulses are applied the storage time is limited by the potential shift of the storage layer due to landing of positive ions.

In order to erase a stored display, $\mathrm{V}_{\mathrm{g} 12}$ is increased to 500 V for 100 ms and than returned to its original potential for about 500 ms ; after that, an erasing pulse of positive polarity (max. 20 V ) and a duration of 600 ms should be applied.
While the erasing pulse amplitude is to be adjusted with zero d.c. level for "just black", the background illumination can be changed - even with a stored signal - by varying the d.c. level for optimum contrast or maximum writing speed.

Background egality can be optimized by balancing the viewing gun cathodes by means of a potentiometer of $2,2 \mathrm{k} \Omega$, proper collimator adjustment, and by increasing $V_{F G A} \cdot V_{g 9-1}$ and $V_{g 9-3}$ in positive direction during erasure.

Before first installation, depending on transport conditions, demagnetization of the tube face region may be necessary.
b. Dynamic erasure

Dynamic erasure can be achieved by applying extra erasing pulses of positive polarity to the backing electrode of the front mesh $\left(g_{12}\right)$. The amplitude of these extra pulses is equal to that of the original erasing pulse, the frequency is 120 Hz and the persistence of the display can be controlled by varying the duty factor.

## Fast-store mode

For erasure in the fast mode the front mesh has to be erased first in the same way as in the variable persistence mode but separate adjustments should be foreseen.
The fast mesh is to be prepared by reducing $\mathrm{V}_{\mathrm{g} 11}$ from 140 V to the stabilizing level ( 0 to max. 20 V ) during the erasing pulse on the front mesh.
After writing, at the end of the unblanking pulse, a transfer pulse ( $500 \mathrm{~V}, 100 \mathrm{~ms}$ ) is to be applied on the front mesh.
During the transfer pulse, $\mathrm{V}_{\mathrm{g} 11}$ is further reduced about 1 V for enhanced transmission during transfer. This reduction has to be carefully adjusted for optimum contrast and writing speed.
During the whole cycle, $\mathrm{FGA}, \mathrm{V}_{\mathrm{g}} 9-1$ and $\mathrm{V}_{\mathrm{g}} 9-3$ may be increased for more viewing gun current. Details on the adjustment procedure and the voltage range to be provided for can be made available.

* The tube has a rotation coil, concentrically wound around the tube neck, to allow alignment of the $x$-träce with the mechanical $x$-axis of the screen. The coil has 2000 turns and a maximum resistance of $650 \Omega$. Under typical operating conditions, a maximum of 20 ampere-turns is required for the maximum rotation of $5^{\circ}$. This means the required supply is 10 mA maximum at 8 V maximum.

## NOTES

1. These values are valid at cut-off of both flood guns and the writing gun. The H.T. unit must be capable of supplying $0,5 \mathrm{~mA}$. To protect the tube against excessive surge current during erasure, an RC network as shown in Fig. 10 must be connected in series with the screen terminal lead; the resistance of 15 to $20 \mathrm{M} \Omega$ includes the internal resistance of the H.T. supply.

Fig. 10.
2. This voltage should be equal to the mean $y$-plate potential. The mean $x$ and $y$-plate potentials should be equal for optimum spot quality.
3. When putting the tube into operation, the astigmatism control voltage should be adjusted only once for optimum spot size in the screen centre. The control voltage will be within the stated range, provided the conditions of note 2 are adhered to.
4. The collimator electrode voltage $\mathrm{V}_{\mathrm{g} 7-2}$ and $\mathrm{V}_{\mathrm{g} 7-3}$ should be adjusted for optimum uniformity of background illumination.
5. Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $\mathrm{I}_{\mathrm{b}}=10 \mu \mathrm{~A}$ (measured on x -plates).
6. The writing speed is defined as the maximum speed at which a written trace is just visible starting from a background which is just black. The indicated value is guaranteed for the central $75 \%$ of the minimum screen area, except the outmost 4 mm of the screen. However, in any corner not more than 4 square divisions fall outside the guaranteed area. The writing speed can be increased, if some background is tolerated. Within the same area, a trace, written with the indicated value of max. write, remains just visible within the indicated storage time of max. write.
The writing speed in max. write, with background, is defined as the maximum speed at which the written trace remains just visible within the indicated storage time.
7. The storage time in just black mode is defined as the time required for the brightness of the unwritten background to rise from zero brightness to $10 \%$ of saturated brightness. At reduced intensity (by pulsing the flood beams) the storage time can be increased.

The storage time in max. write is related to the writing speed.
8. The sensitivity at a deflection less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
9. A graticule, consisting of concentric rectangles of $72 \mathrm{~mm} \times 54 \mathrm{~mm}$ and $69,8 \mathrm{~mm} \times 52,5 \mathrm{~mm}$ is aligned with the electrical $x$-axis of the tube. With optimum corrections applied, a raster will fall between these rectangles.

## OPERATING NOTES

## Modes of operations

Non-storage mode
For non-storage operation the front mesh $\mathrm{V}_{\mathrm{g} 9}$ is set to -50 V with respect to FGK .
The viewing guns should not be switched off in this mode of operation since slight variations in raster geometry and deflection sensitivity might otherwise be caused.

## Variable persistence mode

a. Dynamic erasure

Dynamic erasure can be achieved by applying extra erasing pulses of positive polarity to the backing electrode $\mathrm{V}_{\mathrm{g} 9}$. The amplitude of these extra pulses is equal to that of the original erasing pulse, the frequency is 120 Hz and the persistence of the display can be controlled by varying the duty factor.
b. Static erasure (Fig. 9)

If no dynamic erasing pulses are applied the storage time is limited by the potential shift of the storage layer due to landing of positive ions.
In order to erase a stored display, $\mathrm{V}_{\mathrm{g} 9}$ is increased to 150 V for 100 ms and than returned to its original potential for about 500 ms ; after that, an erasing pulse of positive polarity (max. 15 V ) and a duration of 600 ms should be applied.
While the erasing pulse amplitude is to be adjusted with zero d.c. level for "just black", the background illumination can be changed - even with a stored signal - by varying the d.c. level for optimum contrast or maximum writing speed.
Back ground egality can be optimized by balancing the viewing gun cathodes by means of a potentiometer of $2,2 \mathrm{k} \Omega$, proper collimator adjustment, and by increasing $V_{F G A} \cdot V_{g 7-1}, V_{g 7-2}$ and $V_{g 7-3}$ in positive direction during erasure.
Before first installation, depending on transport conditions, demagnetization of the tube face region may be necessary.

## SURVEY OF MONITOR AND DISPLAY TUBES

PREFERRED TYPES: recommended for new design.
M17-1.42WE
M17-143WE
M17-144WE
M17-145WE
M38-200
MAINTENANCE TYPES: no longer recommended for equipment production.
M24-100W
M24-101W
M31-130W
M31-131W

OBSOLESCENT TYPES: available until present stocks are exhausted.
M17-140W
M17-141W
M38-120W
M38-121W

## SCREENS

Although WA and WE are the standard screens certain applications require screens of a different persistence and/or colour (e.g. GH, GR, GM). Tubes with such screens are supplied to special order.

## BONDED FACEPLATES

Tubes with bonded faceplates are supplied to special order.

## MONITOR TUBE

17 cm diagonal rectangular flat face monitor tube primarily for use as a viewfinder in television cameras. This tube has been replaced by type M17-142WE, which features a $1,5 \mathrm{~W}$ cathode $(6,3 \mathrm{~V} / 240 \mathrm{~mA})$ with short warm-up time (quick-heating cathode), and an improved phosphor, type WE. The data of M17-140W are equivalent to those of type M17-142WE, except for the following.

HEATING
Indirect by a.c. or d.c.*

| Heater voltage | $\mathrm{V}_{\mathrm{f}}$ | $6,3 \mathrm{~V}$ |
| :--- | :--- | :--- |
| Heater current | $\mathrm{I}_{\mathrm{f}}$ | 300 mA |

## SCREEN

$\begin{array}{ll}\text { Phosphor type } & \text { W } \\ \text { fluorescent colour } & \text { white }\end{array}$

* Not to be connected in series with other tubes.

## MONITOR TUBE

17 cm diagonal rectangular flat face monitor tube primarily for use as a viewfinder in television cameras. It has a bonded face plate and a metal mounting band. This tube has been replaced by type M17-143WE, which features a $1,5 \mathrm{~W}$ cathode ( $6,3 \mathrm{~V} / 240 \mathrm{~mA}$ ) with short warm-up time (quick-heating cathode), and an improved phosphor, type WE.

The data of M17-141W are equivalent to those of type M17-143WE, except for the following.

## HEATING

Indirect by a.c. or d.c.*

| Heater voltage | $V_{f}$ | $6,3 \mathrm{~V}$ |

** Catalogue number 3322142 11401; supplied with directions for use with each tube.

- Luminance is measured with a photocell, of which the spectral response curve is identical to that of the human eye, on a 312 -lines raster with dimensions $70 \mathrm{~mm} \times 70 \mathrm{~mm}$.

X-radiation limit curves, at a constant anode current of $250 \mu \mathrm{~A}$, measured according to TEPAC103A.

$0,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curves, measured according to TEPAC103A.

## Product safety

X-ray shielding of the cone is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 14 kV .

## FLASHOVER PROTECTION

With the high voltage used with this tube internal flashovers may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps. The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible.

## MONITOR TUBES

* For optimum focus at a beam current of $50 \mu \mathrm{~A}$.
** Catalogue number 3322142 11401; supplied with directions for use with each tube.
- Luminance is measured with a photocell, of which the spectral response curve is identical to that of the human eye, on a 312 -lines raster with dimensions $70 \mathrm{~mm} \times 70 \mathrm{~mm}$.

## X-RADIATION LIMIT

X-radiation limit curves, at a constant anode current of $250 \mu \mathrm{~A}$, measured according to TEPAC103A.

$0,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curves, measured according to TEPAC103A.

## Product safety

X-ray shielding of the cone is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 14 kV .

## FLASHOVER PROTECTION

With the high voltage used with this tube internal flashovers may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.
The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible.

## MONITOR TUBE

The M24-100W is a 24 cm -diagonal rectangular television tube with metal-backed screen primarily intended for use as a monitor or display tube.

| QUICK REFERENCE DATA |  |

## PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to $800 \mathrm{~A} / \mathrm{m}$ ( 0 to 10 Oe). Adjustment of the centring magnet should not be such that a general reduction in brightness or shading of the raster occurs.

## NOTES

1) The reference line is determined by the plane of the upper edge of the of the flange of reference line gauge when the gauge is resting on the cone.
${ }^{2}$ ) The maximum dimension is determined by the reference line gauge.
${ }^{3}$ ) Deflection coil AT1071/03 is recommended. If another coil is considered, it is advisable to contact the local tube supplier.
${ }^{4}$ ) The bulge at the spliceline seal may increase the indicated maximum values for envelope width, diagonal and height by not more than $6,4 \mathrm{~mm}$, but at any point around the seal the bulge will not protrude more than $3,2 \mathrm{~mm}$ beyond the envelope surface.

## PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to $800 \mathrm{~A} / \mathrm{m}$ ( 0 to 10 Oe ). Adjustment of the centring magnet should not cause a general reduction in brightness or shading of the raster.

## NOTES TO OUTLINE DRAWINGS

${ }^{1}$ ) The reference line is determined by the plane of the upper edge of the flange of the reference line gauge with the gauge resting on the cone.
2) The maximum dimension is determined by the reference line gauge.
${ }^{3}$ ) This tube has an external conductive coating ( m ), which must be earthed.
The capacitance of this coating to the final accelerator is used for smoothing the EHT. The tube marking and warning labels are on the side of the cone opposite the final accelerator contact, and this side should not be used for making contact to the conductive coating.
4) This area must be kept clean.
5) Minimum space to be reserved for mounting lugs.
6) The mounting screws in the cabinet must be situated within a circle with a diameter of 4 mm drawn around the true geometrical position (corners of a rectangle of $207,4 \mathrm{~mm}$ $\mathrm{x} 158,5 \mathrm{~mm}$ ).
${ }^{7}$ ) The maximum displacement of any lug with respect to the plane through the other three lugs is 2 mm .
8) The metal rim-band must be earthed. The hole of $2,5 \mathrm{~mm}$ diameter in each lug is provided for this purpose.
${ }^{9}$ ) The bulge at the spliceline seal may increase the indicated maximum values for envelope width, diagonal and height by not more than $6,4 \mathrm{~mm}$, but at any point around the seal the bulge will not protrude more than $3,2 \mathrm{~mm}$ beyond the envelope surface.

## PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to $800 \mathrm{~A} / \mathrm{m}$ ( 0 to 10 Oe ). Adjustment of the centring magnet should not cause a general reduction in brightness or shading the raster.

## NOTES TO OUTLINE DRAWINGS

1) The reference line is determined by the plane of the upper edge of the flange of the reference line gauge with the gauge resting on the cone.
2) The maximum dimension is determined by the reference line gauge.
3) This tube has a external conductive coating (m), which must be earthed.

The capacitance of this coating to the final accelerator is used for smoothing the EHT. The tube marking and warning labels are on the side of the cone opposite the final accelerator contact, and this side should not be used for making contact to the conductive coating.
4) This area must be kept clean.
5) Minimum space to be reserved for mounting lugs.
6) The mounting screws in the cabinet must be situated within a circle with a diameter of 6 mm drawn around the true geometrical position (corners of a rectangle of $267,5 \mathrm{~mm}$ x 204, 4 mm ).
7) The maximum displacement of any lug, with respect to the plane through the other three lugs is 2 mm .
8) The metal rim-band must be earthed. For this purpose the band is provided with a tag.
9) The bulge of the spliceline seal may increase the indicated maximum values for envelope width, diagonal, and height by not more than $6,4 \mathrm{~mm}$, but at any point around the seal the bulge will not protrude more than $3,2 \mathrm{~mm}$ beyond the envelope surface.

## NOTES TO OUTLINE DRAWING

${ }^{1)}$ The reference line is determined by the plane of the upper edge of the flange of reference line gauge, (JEDEC 126) when the gauge is resting on the cone.
2) End of guaranteed contour. The maximum neck and cone contour is given by the Reference line gauge.
3) Bulge at splice-line seal may increase the indicated maximum value for envelope width, diagonal and height by not more than $6,4 \mathrm{~mm}$, but at any point around the seal, the bulge will not protrude more than $3,2 \mathrm{~mm}$ beyond the envelope surface at the location specified for dimensioning the envelope width, diagonal and height.
${ }^{4}$ ) The tube should be supported on both sides of the bulge. The mechanism used should provide clearance for the maximum dimensions of the bulge.
${ }^{5}$ ) The maximum dimension is determined by the reference line gauge

## PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to $800 \mathrm{~A} / \mathrm{m}$ ( 0 to 10 oersted ). Adjustment of the centring magnet should not be such that a general reduction in brightness or shading of the raster occurs.

## CAPACITANCE

Control grid to all other elements
Cathode to all other elements
Final accelerator to external conductive coating

## WARNING

X-ray shielding is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 16 kV .

## EXTERNAL CONDUCTIVE COATING

This tube has an external conductive coating (m), which must be earthed and capacitance of this to the final electrode is used to provide smoothing for the EHT supply. The tube marking and warning labels are on the side of the cone opposite the final electrode connector and this side should not be used for making contact to the external conductive coating.

## REFERENCE LINE GAUGE

Dimensions in mm
JEDEC 126

## REMARK

With the high voltage used with this tube internal flash-overs may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.
The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible. On request the tube can be supplied with spark traps mounted in the base (ring trap base).

## MONITOR TUBE

The M38-121 is a 38 cm -diagonal rectangular television tube with metai backed screen and integral protection primarily intended for use as a monitor or display tube.

## REMARK

With the high voltage used with this tube internal flash -overs may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.
The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible.
On request the tube can be supplied with spark traps mounted in the base (ring trap base).

## VERY HIGH RESOLUTION CATHODE-RAY TUBE

The M38-200 is a $38 \mathrm{~cm}, 70^{\circ}$ data graphic display tube with a resolution of more than 6,6 line pairs per mm (corresponding to 3000 TV lines). Used in conjunction with deflection unit AT1991 it is eminently suitable for full page document display.
The resolution easily meets the stringent requirements of the CCITT recommendations for digital group III, high resolution facsimile transmission, and those of graphic displays for computer-aided design.

Tubes with white (WA and WE) or green (GH) screen phosphors are standard; the WE phosphor is recommended for photographic applications. Other phosphors are available to special order. The tubes have a metal-backed screen and rim band for implosion protection.

## X-RADIATION

Radiation emitted will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ throughout the useful life of the tube when operated within the given ratings.

## FLASHOVER PROTECTION

With the high voltage used with this tube internal flashovers may occur. These may destroy the cathode of the tube. Therefore it is necessary to provide protective circuits, using spark gaps. The spark gaps must be connected as follows:

Fig. 11.
No other connections between the outer conductive coating and the chassis are permissible.

## VERY HIGH RESOLUTION CATHODE-RAY TUBE/COIL ASSEMBLY

This tube/coil assembiy consists of the very high resolution tube M38-200 and the deflection unit AT1991; it is adjusted for astigmatism correction of the spot at the screen centre. For data see the data sheets of M38-200 and AT1991.

## REMARKS

Measures should be taken for the beam current to be switched off immediately when one of the time-base circuits becomes defective.

An X-ray radiation shielding with an equivalent lead thickness of 0.5 mm is required to protect the observer.

[^56]

ACCESSORIES

## DEFLECTION UNIT

## QUICK REFERENCE DATA

| Monitor tube <br> diagonal <br> neck diameter | $17 \mathrm{~cm}(7 \mathrm{in})$ |
| :--- | :--- |
| Deflection angle | $28,6 \mathrm{~mm}$ |
| Line deflection current, edge to edge at 15 kV | $90^{\circ}$ |
| Inductance of line coils | $7,6 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Field deflection current, edge to edge at 15 kV | $86,5 \mu \mathrm{H}$ |
| Resistance of field coils (parallel connected) | $0,79 \mathrm{~A} \mathrm{(p-p)}$ |

## APPLICATION

This deflection unit is for use with $17 \mathrm{~cm}(7 \mathrm{in}) 70^{\circ}$ monitor tube M17-142 in conjunction with:
line output transformer AT2102/02;
linearity control unit AT4036/00A;
line driver transformer AT4043/56.

## DESCRIPTION

The saddle-shaped line deflection coils are moulded so that the deflection centre is well within the conical part of the monitor tube. The field deflection coils are wound on a Ferroxcube yoke ring which is flared so that the frame and line deflection centres coincide. Provisions are made for centring, and correction of pin-cushion distortion. The unit meets the self-extinguishing and non-dripping requirements of IEC 65.

## MOUNTING

The unit should be mounted as far forward as possible on the neck of the monitor tube, so that it touches the cone.

To orient the raster correctly, the unit may be rotated by hand on the neck of the monitor tube, with which it makes a slip fit. A screw-tightened clamping ring permits it to be locked, both axially and radially, in the desired position.

Fig. 1 Deflection unit AT1071/07. Facilities for fitting correction magnets:
(1) for plastic-bonded FXD magnet rods catalogue number 312210490360 ;
(2) for plastic-bonded FXD magnets, catalogue number 312210494120.

The unit is provided with solder pins for connection. The pin numbering in Fig. 1 corresponds to that in the connection diagram (Figs 2a and 2b).

$0,79 \mathrm{~A}(p-p)$

Geometric distortion measured without correction and centring magnets on a $17 \mathrm{~cm}(7 \mathrm{in}) 70^{\circ}$ reference tube (dimensions in mm )
The spreads in raster geometry are tabulated below as deviations from the ideal rectangle at the points indicated. Cartesian coordinates are used to show the extent of deviation resolved along $x$ and $y$ areas. Points A, B, C, D, E are fixed and hence zero spreads.

Spreads ( $\mathrm{x}, \mathrm{y}$ ) per point
F ( $-0,5 \pm 2,0, \quad+1,0 \pm 1,5$ )
$\mathrm{G}(+0,5 \pm 2,0, \quad+1,0 \pm 1,5)$
$H(-0,5 \pm 2,0,-1,0 \pm 1,5)$
$\mathrm{J}(+0,5 \pm 2,0,-1,0 \pm 1,5)$

Fig. 3.

## CORRECTION FACILITIES

## For centring

After adjustment of the linearity of the deflection current, the eccentricity of the monitor tube and the deflection unit can be corrected by means of two independently movable centring magnets of plastic-bonded Ferroxdure. These magnets are magnetized diametrically. By turning the magnets with respect to each other the resulting field strength is varied. The direction of the resulting magnetic field is adjusted by turning the magnets simultaneously.
These centring magnets cannot be used for compensating the effects of non-linearity or of phase differences between the synchronization and time base, as otherwise the correction needed becomes excessive. Even if the correction is within the range of the magnets, curved lines may appear in the centre of the raster.

Fig. 4.

## For pin-cushion distortion

Pin-cushion distortion can be corrected by two Ferroxdure magnets with pole-shoebrackets, which have been mounted on the deflection unit. Limited correction of asymmetrical pin-cushion distortion can be-achieved by unequal movement of these magnets. The field strength can be adjusted by rotation of these magnets. To correct the top and bottom of the raster, two plastic-bonded Ferroxdure magnet rods* can be fitted (Fig. 1). To correct the corners of the raster, four plastic-bonded Ferroxdure magnets** (Fig. 1) can be fitted.

[^57]
## DEFLECTION UNIT

- For use with very high resolution c.r.t. M38-200.

## QUICK REFERENCE DATA

| Associated c.r.t. | $38 \mathrm{~cm}(15 \mathrm{in})$ |
| :--- | :--- |
| $\quad$ diagonal | $36,8 \mathrm{~mm}$ |
| neck diameter | $70^{\circ}$ |
| Deflection angle | $4,03 \mathrm{~A}$ |
| Line deflection current, edge to edge, at 18 kV | $136,5 \mu \mathrm{H}$ |
| Inductance of line coils, parallel connected | 474 mA |
| Field deflection current, edge to edge, at 18 kV | $23,5 \Omega$ |
| Resistance of field coils, series connected |  |

## APPLICATION

This deflection unit is for use with $38 \mathrm{~cm}, 70^{\circ}$ cathode ray tube $\mathrm{M} 38-200$, neck diameter $36,8 \mathrm{~mm}$.

## DESCRIPTION

The saddle-shaped line and field deflection coils are surrounded by a Ferroxcube yoke ring in such a way that the line and field deflection centres coincide. Provisions are made for centring correction, and astigmatism correction of the spot at the screen centre. The field coils have internal damping resistors. The unit has a non-magnetic metal clamping ring for fixing to the tube neck.
The deflection unit meets the self-extinguishing requirements of UL.

Fig. 1.
Tightening torque on clamping ring
Torque on centring magnets

1,3 to $1,5 \mathrm{Nm}$
35 to 250 mNm

## Mounting

The unit should be mounted as far forward as possible on the neck of the tube, so that it touches the cone.
The tube/coil combination is optimized for use in "portrait" scan mode, with line scan frequency up to $125 \mathrm{kHz} ; \mathrm{H}$.T. contact and top of the deflection unit upwards.
To orient the raster correctly, the unit may be manually rotated around the neck. The screw-tightened clamping ring permits it to be locked, both axially and radially, in the desired position.

ENVIRONMENTAL DATA

| Maximum operating temperature (average copper temperature) | $95^{\circ} \mathrm{C}$ |

Fig. 3.

## CENTRING CORRECTION

The eccentricity of the c.r.t. and the deflection unit can be corrected by two independently movable centring magnets, which are magnetized diametrically. By turning the magnets with respect to each other the resulting field strength is varied. The direction of the resulting magnetic field is adjusted by turning the magnets simultaneously. The magnets must be adjusted so that the curvature of the horizontal and vertical axes disappears; in general the picture will be centred at the same time, otherwise this should be corrected electronically.

Fig. 4.

## ASTIGMATISM CORRECTION

The astigmatism of the undeflected beam can be corrected by two independently movable quadripole magnets, which are placed next to the centring magnets. By turning the quadripole magnets with respect to each other the resulting four-pole field strength varies. The direction of the resulting four-pole field is adjusted by turning the quadripole magnets simultaneously. The astigmatism of the undeflected beam is examined during a slow variation of the focusing voltage; the beam is free of astigmatism when the size, and not the shape, of the beam changes when the focusing voltage is varied around its optimum (Figs 5 and 6).

## BEAM CENTRING MAGNET

## INSTRUCTIONS FOR USE

To obtain the best performance from an electrostatically focussed tube, it is important that the axis of the beam should coincide with that of the lens. In bractice this is not always so because of small errors in geometry. By means of this magnet it is possible to adjust, if necessary, the position of the beam and so produce a true alignment in every case. The effect is illustrated in Figs lat and 16 which show enlarged views of a single element in a spot raster under the special operating conditions given in the directions for setting. With a well aligned beam, an image such as that in Fig. la can be seen. Very small errors will produce a spot as shown in Fig. lb where the brightest part of the image does not appear in the centre of the diffused area or haze. In such a case, the picture quality would be good but with only a small adjustment of the beam, so that the brightest part becomes central, a noticeable improvement can be made.

The unit has a non-magnetic ring containing a diametrically magnetized Ferroxdure core and two soft-iron pole pieces covered with plastic material to protect the glass surface.

Fig. la

Fig. 1b

The field strength can be altered by turning the core as indicated in Fig. 2, and the direction by turning the whole unit. Moving the unit along the neck of the tube will cause a small change in the position of the beam but it is most effective at about 20 mm from the cap (Fig. 3).

Fig. 2

Fig. 3

## SETTING

This can best be done with a spot raster on the screen, and by observing one of the elements near the centre. A suitable raster would have, for instance, a spot duration of $1 / 6 \mu \mathrm{~s}$ with a repetition time of $6 \mu \mathrm{~s}$ and an image as in Fig. 1 can then be produced with the following conditions.

*) To avoid burning the screen, adjust slowly from -50 V to zero
Set the unit on the neck at about 20 mm from the cap and turn it until the brightest part of the image appears central in the haze.

Fig. 4

The diagrams in Fig. 4 show the process of adjusting the brightest part from its original position to the centre. The distance between the two points will be determined by the field strength, and the position of the new point along the dotted line will depend on the direction of the field.
If the magnet is under or over-correcting as in (Figs 4a and 4b), the field strength must be changed. To do this, remove the unit from the neck, push the core out sufficiently to get a finger grip and turn it towards maximum or minimum Figs 2a and $2 b$ as required. Return it to the stop in the clamp and set the unit once again on the neck.

If the means of producing a spot raster are not available, a test pattern or suitable picture can be used when setting. It is not easy with this method, however, to assess the degree of change needed in field strength or direction but if a start is made with the line on the core set at about $20^{\circ}$ from the minimum position in Fig. 2, an improvement can be made in most cases where it is required. In others, it may be necessary to try one or two further core settings, but with a little experience it is not difficult to find an arrangement which gives the best vertical and horizontal resolution.
The unit should be sufficiently tight on the neck to prevent movement during transit but if, for some reason, this does not appear to be so, the bends on the ring should be compressed slightly.

[^0]:    * Supersedes the ICO6N 1985 edition and the Supplement to IC06N issued Autumn 1985.

[^1]:    * A bogey tube is a tube whose characteristics have the published nominal values for the type. A bogey tube for any particular application can be obtained by considering only those characteristics which are directly related to the application.

[^2]:    l) As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:
    a) under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5, \ell}$ for optimum spot quality at the centre of the screen.
    b) under these conditions, but no raster, the deflection plate voltages should be changed to
    $\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=1000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=700 \mathrm{~V}$, thus directing the total beam current to x 2 .
    Measure the current on $\mathrm{x}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{x} 2}=10 \mu \mathrm{~A}$ (being the beam current Il)
    c) set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{g} 1}$ control. Now a raster display with a true $10 \mu \mathrm{~A}$ screen current is achieved.
    d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
    3) See next page.

[^3]:    * Not to be connected in series with other tubes.

[^4]:    * Not to be connected in series with other tubes.

[^5]:    * The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the x-trace with the mechanical $x$-axis of the screen. The coil has 1000 turns and a maximum resistance of $250 \Omega$. Under typical operating conditions, a maximum of 10 ampere-turns are required for the maximum rotation of $3^{\circ}$. This means the required current is 10 mA maximum at a required voltage of $2,5 \mathrm{~V}$ maximum.

[^6]:    * Not to be connected in series with other tubes.

[^7]:    * The tube has a trace rotation coil, fixed onto the lower cone part. The coil has 1000 turns and a typical resistance of $165 \Omega$ at $20^{\circ} \mathrm{C}$ (max. $250 \Omega$ at $80^{\circ} \mathrm{C}$ ). Approx. 5 mA causes $1^{\circ}$ trace rotation. Thus maximum required voltage is approx. 11 V for tube tolerances ( $\pm 5^{\circ}$ ) and earth magnetic field with reasonable shielding ( $\pm 2^{\circ}$ ).

[^8]:    * Notes are on the next page.

[^9]:    * Not to be connected in series with other tubes.

[^10]:    * The tube has a rotation coil, concentrically wound around the tube neck, to allow alignment of the $x$-trace with the mechanical $x$-axis of the screen. The coil has 1000 turns and a maximum resistance of $150 \Omega$. Under typical operating conditions, approx. 50 ampere-turns are required for the maximum rotation of $5^{\circ}$.

[^11]:    * Not to be connected in series with other tubes.

[^12]:    * Not to be connected in series with other tubes.

[^13]:    * Notes are on last page but one.

[^14]:    ${ }^{1}$ ) All that will be necessary when putting the tube into operation is to adjust the astigmatism control voltage once for optimum spot shape in the screen centre. The control voltage will always be in the range stated, provided the mean x and certainly the mean $y$ plate potential was made equal to $\mathrm{V}_{\mathrm{g}_{2}}, \mathrm{~g}_{4}, \mathrm{~g}_{5}, \ell$ with zero astigmatism correction.
    ${ }^{2}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
    3) The mean $x$ and certainly the mean $y$ plate potential should be equal to $V_{g_{2}}, g_{4}, g_{5}, \ell$ with astigmatism adjustment set to zero.
    4) A graticule, consisting of concentric rectangles of $70 \mathrm{~mm} \times 85 \mathrm{~mm}$ and 68.8 mm x 83 mm as aligned with the electrical x -axis of the tube. The edges of a raster will fall between these ractangles.

[^15]:    Notes see page with "Notes".

[^16]:    ${ }^{1}$ ) To align the $x$ trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will, have 50 ampere turns for the indicated maximum rotation of $5^{\circ}$ and should be positioned as indicated in the drawing.

[^17]:    1) See "Notes".
[^18]:    Notes see next page.

[^19]:    ${ }^{1}$ ) The connection to the final accelerator electrode is made by means of an EHT cable attached to the tube.
    ${ }^{2}$ ) The diameter of the mu-metal shield should be large enough to avoid damage to the side contacts.

[^20]:    * Not to be connected in series with other tubes.

[^21]:    * Not to be connected in series with other tubes.

[^22]:    Note
    The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the $x$-trace with the mechanical $x$-axis of the screen. The coil has 1000 turns and a resistance of max. $400 \Omega$. Under typical operating conditions, max. 30 ampere-turns are required for the max. rotation of $5^{\circ}$. This means the required current is $\max .30 \mathrm{~mA}$ at a required voltage of max. 12 V .

[^23]:    * Not to be connected in series with other tubes.

[^24]:    * Not to be connected in series with other tubes.

[^25]:    * The tube is provided with a rotation coil, concentrically wound around the tube neck, enabling the alignment of the $x$-trace with the mechanical $x$-axis of the screen. The coil has 1000 turns and a resistance of max. $350 \Omega$. Under typical operating conditions, max. 35 ampere-turns are required for the max. rotation of $5^{\circ}$. This means the required current is max. 35 mA at a required voltage of max. 12 V .

[^48]:    ${ }^{1}$ ) During a warm-up period not exceeding 15 s the heater may be 410 V negative with respect to the cathode,

[^49]:    1) During a warm-up period not exceeding 15 s the heater may be 410 V negative with respect to the cathode.
[^50]:    ${ }^{1}$ ) The reference line is determined by the plane of the upper edge of the flange of the reference line gauge with the gauge resting on the cone.
    ${ }^{2}$ ) The maximum dimension is determined by the reference line gauge.

[^51]:    $\overline{1)}$ During a warm-up period not exceeding 15 s the heater may be 410 V negative with respect to the cathode.

[^52]:    1) During a warm-up period not exceeding 15 s the heater may be 410 V negative with respect to the cathode.
[^53]:    ${ }^{1}$ ) With the small change in focus spot size with variation of focus voltage the limit of 0 to 400 V is such that an acceptable focus quality is obtained within this range. If it is required to pass through the point of focus, a voltage of at least -100 V to +500 V will be required.

[^54]:    1) With the small change in focus spot size with variation of focus voltage the limit of 0 to $\cdot 400 \mathrm{~V}$ is such that an acceptable focus quality is obtained within this range. If it is required to pass through the point of focus, a voltage range of at least -100 to +500 V will be required.
[^55]:    * Pixel = picture element.

[^56]:    1) In order to avoid excessive hum, the A.C. component of the heater to cathode voltage should be as low as possible and should not exceed $20 \mathrm{~V}_{\mathrm{R} M S}$.
    ${ }^{2}$ ) During a heating-up period not exceeding 45 sec .
