## DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of four series of handbooks:
ELECTRON TUBES ..... BLUE
SEMICONDUCTORS ..... RED
INTEGRATED CIRCUTS

## COMPONENTS AND MATERIALS

The contents of each series are listed on pages iv to viii.
The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.
When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Electronic Components and Materials Division is given in our Preferred Type Range catalogue (issued annually).
Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.
Product specialists are at your service and enquiries will be answered promptly.

## ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks comprises:
T1 Tubes for r.f. heating

T2a Transmitting tubes for communications, glass types
T2b Transmitting tubes for communications, ceramic types
T3 Klystrons
T4 Magnetrons for microwave heating
Cathode-ray tubes
Instrument tubes, monitor and display tubes, C. R. tubes for special applications
T6 Geiger-Müller tubes
T8 Colour display systems
Colour TV picture tubes, colour data graphic display tube assemblies, deflection units
T9 Photo and electron multipliers

T10 Plumbicon camera tubes and accessories

T11 Microwave semiconductors and components
T12 Vidicon and Newvicon camera tubes

T13 Image intensifiers and infrared detectors

T15
Dry reed switches

T16 Monochrome tubes and deflection units
Black and white TV picture tubes, monochrome data graphic display tubes, deflection units

## SEMICONDUCTORS (RED SERIES)

The red series of data handbooks comprises:

## S1 Diodes

Small-signal silicon diodes, voltage regulator diodes ( $<1,5 \mathrm{~W}$ ), voltage reference diodes, tuner diodes, rectifier diodes

S2a Power diodes
S2b Thyristors and triacs
S3 Small-signal transistors
S4a Low-frequency power transistors and hybrid modules
S4b High-voltage and switching power transistors
S5 Field-effect transistors
S6 R.F. power transistors and modules
S7 Surface mounted semiconductors
Light-emitting diodes
S8b Devices for optoelectronics
Optocouplers, photosensitive diodes and transistors, infrared light-emitting diodes and infrared sensitive devices, laser and fibre-optic components

S9 Power MOS transistors
S10 Wideband transistors and wideband hybrid IC modules

S11 Microwave transistors

S12 Surface acoustic wave devices
S13 Semiconductor sensors

## INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of data handbooks comprises:

## EXISTING SERIES <br> Superseded by:

IC1 Bipolar ICs for radio and audio equipment
IC01N
IC2 Bipolar ICs for video equipment ICO2Na and ICO2Nb
IC3 ICs for digital systems in radio, audio and video equipment IC01N, ICO2Na and IC02Nb
IC4 Digital integrated circuits CMOS HE4000B family

IC5 Digital integrated circuits - ECL IC08N
ECL10000 (GX family), ECL100 000 (HX family), dedicated designs
IC6 Professional analogue integrated circuits ICO3N and Supplement to IC11N
IC7 Signetics bipolar memories
$\begin{array}{ll}\text { IC8 Signetics analogue circuits } & \text { IC11N }\end{array}$
IC9 Signetics TTL logic IC09N and IC15N
$1 C 10$. Signetics Integrated Fuse Logic (IFL) IC13N

IC11 Microprocessors, microcomputers and peripheral circuitry IC14N

## NEW SERIES

## COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks comprises:
C1 Programmable controller modules
PLC modules, PC20 modules
C2 Television tuners, coaxial aerial input assemblies, surface acoustic wave filters
C3 Loudspeakers
C4 Ferroxcube potcores, square cores and cross cores
C5 Ferroxcube for power, audio/video and accelerators
C6 Synchronous motors and gearboxes
C7 Variable capacitors
C8 Variable mains transformers
C9 Piezoelectric quartz devices
C10 Connectors
C11 Varistors, thermistors and sensors
C12 Potentiometers, encoders and switches
C13 Fixed resistors
C14 Electrolytic and solid capacitors
C15 Ceramic capacitors
C16 Permanent magnet materials
C17 Stepping motors and associated electronics
C18 Direct current motors
C19 Piezoelectric ceramics
C20 Wire-wound components for TVs and monitors
C21* Assemblies for industrial use
HNIL FZ/30 series, NORbits $60-$, 61 -, 90 -series, input devices
C22 Film capacitors

GENERAL

## LIST OF SYMBOLS

Symbols denoting electrodes/elements and electrode/element connections
$f$ Heater
$k \quad$ Cathode
g Grid: Grids are distinguished by means of an additional numeral; the electrode nearest to the cathode having the lowest number.
a Anode
$m \quad$ External conductive coating
$m^{1} \quad$ Rim band
$\ell \quad$ Fluorescent screen
i.c. Tube pin which must not be connected externally
n.c. Tube pin which may be connected externally

## Symbols denoting voltages

Unless otherwise stated, the reference point for electrode voltages is the cathode.
$\checkmark$ Symbol for voltage, followed by a subscript denoting the relevant electrode/element
$V_{f} \quad$ Heater voltage
$V_{p p} \quad$ Peak-to-peak value of a voltage
$V_{p} \quad$ Peak value of a voltage
$\mathrm{V}_{\mathrm{GR}} \quad$ Grid 1 voltage for visual extinction of focused raster (grid drive service)
$\mathrm{V}_{\mathrm{KR}} \quad$ Cathode voltage for visual extinction of focused raster (cathode drive service)

## Symbols denoting currents

1. Symbol for current followed by a subscript denoting the relevant electrode

If Heater current (r.m.s. value)
Note: The symbols quoted represent the average value of the current, unless otherwise stated.

## Symbols denoting powers

$\mathrm{P}_{\ell} \quad$ Dissipation of the fluorescent screen
$\mathrm{P}_{\mathrm{g}} \quad$ Grid dissipation

## Symbols denoting capacitances

See IEC publication 100

## Symbols denoting resistances and impedances

R Symbol for resistance followed by a subscript for the relevant electrode pair. When only one subscript is given the second electrode is the cathode.
Z Symbol for impedance followed by a subscript for the relevant electrode pair. When only one subscript is given the second electrode is the cathode.

## Symbols denoting various quantities

L Luminance
f Frequency
H Magnetic field strength

# GENERAL OPERATIONAL RECOMMENDATIONS 

## INTRODUCTION

Equipment design should be based on the characteristics as stated in the data sheets. Where deviations from these general recommendations are permissible or necessary, statements to that effect will be made.

If applications are considered which are not referred to in the data sheets of the relevant tube type, extra care should be taken with circuit design to prevent the tube being overloaded due to unfavourable operating conditions.

## SPREAD IN TUBE CHARACTERISTICS

The spread in tube characteristics is the difference between maximum and minimum values. Values not qualified as maximum or minimum are nominal ones. It is evident that average or nominal values, as well as spread figures, may differ according to the number of tubes of a certain type that are being checked. No guarantee is given for values of characteristics in settings substantially differing from those specified in the data sheets.

## SPREAD AND VARIATION IN OPERATING CONDITIONS

The operating conditions of a tube are subject to spread and/or variation.
Spread in an operating condition is a permanent deviation from an average condition due to, e.g., component value deviations. The average condition is found from such a number individual cases taken at random that an increase of the number will have a negligible influence.
Variation in an operating condition is non-permanent (occurs as a function of time), e.g., due to supply voltage fluctuations. The average value is calculated over a period such that a prolongation of that period will have negligible influence.

## LIMITING VALUES

Limiting values are in accordance with the applicable rating system as defined by IEC publication 134. Reference may be made to one of the following 3 rating systems.
Absolute maximum rating system. Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.
These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.
The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment components spread and variation, equipment control adjustment, load variations, signal variation, environmental conditions, and spread or variations in characteristics of the device under considerations and of all other electronic devices in the equipment.

Design-maximum rating system. Design-maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and thoughout life, no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

Design-centre rating system. Design-centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under average conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply-voltage variation, equipment component spread and variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations or spread in the characteristics of all electronic devices.

The equipment manufacturer shouid design so that, initially, no design-centre value for the intended service is exceeded with a bogey electronic device* in equipment operating at the stated normal supply voltage.
If the tube data specify limiting values according to more than one rating system the circuit has to be designed so that none of these limiting values is exceeded under the relevant conditions.
In addition to the limiting values given in the individual data sheets the directives in the following paragraphs should be observed.

## HEATER SUPPLY

For maximum cathode life and optimum performance it is recommended that the heater supply be designed at the nominal heater voltage at zero beam current. Any deviation from this heater voltage has a detrimental effect on tube performance and life, and should therefore be kept to a minimum. In any case the deviations of the heater voltage must not exceed $+5 \%$ and $-10 \%$ from the nominal value at zero beam current. Such deviations may be caused by:

- mains voltage fluctuations;
- spread in the characteristics of components such as transformers, resistors, capacitors, etc.;
- spread in circuit adjustments;
- operational variations.
* A bogey tube is a tube whose characteristics have the published nominal values for the type. A bogey tube for any particular application can be obtained by considering only those characteristics which are directly related to the application.

## CATHODE TO HEATER VOLTAGE

The voltage between cathode and heater should be as low as possible and never exceed the limiting values given in the data sheets of the individual tubes. The limiting values relate to that side of the heater where the voltage between cathode and heater is greatest. The voltage between cathode and heater may be d.c., a.c., or a combination of both. Unless otherwise stated, the maximum values quoted indicate the maximum permissible d.c. voltage. If a combination of d.c. and a.c. voltages is applied, the peak value may be twice the rated $\mathrm{V}_{\mathrm{k} f}$; however, unless otherwise stated, this peak value shall never exceed 315 V . Unless otherwise stated, the $\mathrm{V}_{\mathrm{kf}} \mathrm{max}$. holds for both polarities of the voltage; however, a positive cathode is usually the most favourable in view of insulation during life.
A d.c. connection should always be present between heater and cathode. Unless otherwise specified the maximum resistance should not exceed $1 \mathrm{M} \Omega$; the maximum impedance at mains frequency should be less than $100 \mathrm{k} \Omega$.

## INTERMEDIATE ELECTRODES (between cathode and anode)

In no circumstances should the tube be operated without a d.c. connection between each electrode and the cathode. The total effective impedance between each electrode and the cathode should never exceed the published maximum value. However, no electrode should be connected directly to a high energy source. When such a connection is required, it should be made via a series resistor of not less than $1 \mathrm{k} \Omega$.

## CUT-OFF VOLTAGE

Curves showing the limits of the cut-off voltage as a function of grid 2 voltage are generally included in the data. The brightness control should be so dimensioned that it can handle any tube within the limits shown, at the appropriate grid 2 voltage.
The published limits are determined at an ambient illumination level of 10 lux. Because the brightness of a spot is in general greater than that of a raster of the same current, the cut-off voltage determined with the aid of a focused spot will be more negative by about 5 V as compared with that of a focused raster.

## LUMINESCENT SCREEN

To prevent permanent screen damage, care should be taken:

- not to operate the tube with a stationary picture at high beam currents for extended periods;
- not to operate the tube with a stationary or slowly moving spot except at extremely low beam currents;
- if no e.h.t. bleeder is used, to choose the time constants of the cathode, grid 1 , grid 2 , and deflection circuits, such that sufficient beam current is maintained to discharge the e.h.t. capacitance before deflection has ceased after equipment has been switched off.

## EXTERNAL CONDUCTIVE COATING

The external conductive coating must be connected to the chassis. The capacitance of this coating to the final accelerating electrode may be used to provide smoothing for the e.h.t. supply.

The coating is not a perfect conductor and in order to reduce electromagnetic radiation caused by the line time base and the picture content it may be necessary to make multiple connections to the coating. See also 'Flashover'.

## METAL RIMBAND

An appreciable capacitance exists between the metal rimband and the internal conductive coating of the tube; its value is quoted in the individual data sheets. To avoid electric shock, a d.c. connection should be provided between the metal band and the external conductive coating. In receivers where the chassis can be connected directly to the mains there is a risk of electric shock if access is made to the metal band. To reduce the shock to the safe limit, it is suggested that a $2 \mathrm{M} \Omega$ resistor capable of handling the peak voltages be inserted between the metal band and the point of contact with the external conductive coating. This safety arrangement will provide the necessary insulation from the mains but in the event of flashover high voltages will be induced on the metal band. It is therefore recommended that the $2 \mathrm{M} \Omega$ resistor be bypassed by a $4,7 \mathrm{nF}$ capacitor capable of withstanding the peak voltage determined by the voltage divider formed by this capacitor and the capacitance of the metal rimband to the internal conductive coating, and the anode voltage. The $4,7 \mathrm{nF}$ capacitor also serves to improve e.h.t. smoothing by adding the rimband capacitance to the capacitance of the outer conductive coating.

## FLASHOVER

High electric field strengths are present between the gun electrodes of picture tubes. Voltages between gun electrodes may reach values of 20 kV over approx. 1 mm . Although the utmost precautions are taken in the design and manufacture of the tubes, there is always a chance that flashover will occur. The resulting transient currents and voltages may be of sufficient magnitude to cause damage to the tube itself and to various components on the chassis. Arcing terminates when the e.h.t. capacitor is discharged. Therefore it is of vital importance to provide protective circuits with spark gaps and series resistors, which should be connected according to Fig. 1. No other connections between the outer conductive coating and the chassis are permissible.
As our picture tubes are manufactured in Soft-Flash technology, the peak discharge currents are limited to approx. 60 A , offering higher set reliability, optimum circuit protection and component savings (see also Technical Note 039). However this limited value of 60 A is still too high for the circuitry which is directly connected to the tube socket. Therefore Soft-Flash picture tubes should also be provided with spark gaps.

Fig. 1.

## IMPLOSION PROTECTION

All picture tubes employ integral implosion protection and must be replaced with a tube of the same type number or recommended replacement to assure continued safety.

## HANDLING

Although all picture tubes are provided with integral implosion protection, which meets the intrinsic protection requirements stipulated in the relevant part of IEC 65, care should be taken not to scratch or knock any part of the tube. The tube assembly should never be handled by the neck, deflection unit or other neck components.
A picture tube assembly can be lifted from the edge-down position by using the two upper mounting lugs. An alternative lifting method is firmly to press the hands against the vertical sides of the rimband.
When placing a tube assembly face downwards ensure that the screen rests on a soft pad of suitable material, kept free from abrasive substances. When lifting from the face-down position the hand should be placed under the areas of the faceplate close to the mounting lugs at diagonally opposite corners of the faceplate (Fig. 2).
When lifting from the face-up position the hands should be placed under the areas of the cone close to the mounting lugs at diagonally opposite corners of the cone (Fig. 3).

Fig. 2 Lifting tube assembly from face-down position.

Fig. 3 Lifting tube assembly from face-up position.

In all handling procedures prior to insertion in the receiver cabinet there is a risk of personai injury as a result of severe accidental damage to the tube. It is therefore recommended that protective clothing should be worn, particularly eye shielding.

When suspending the tube assembly from the mounting lugs ensure that a minimum of 2 are used; UNDER NO CIRCUMSTANCES HANG THE TUBE ASSEMBLY FROM ONE LUG.

If provided the slots in the rimband of colour picture tubes are used in the mounting of the degaussing coils. It is not recommended to suspend the tube assembly from one or more of these slots as permanent deformation to the rimband can occur.

Remember when replacing or servicing the tube assembly that a residual electrical charge may be carried by the anode contact and also the external coating if not earthed. Before removing the tube assembly from the equipment, earth the external coating and short the anode contact to the coating.

## PACKING

The packing provides protection against tube damage under normal conditions of shipment or handling. Observe any instructions given on the packing and handle accordingly. The tube should under no circumstances be subjected to accelerations greater than $350 \mathrm{~m} / \mathrm{s}^{2}$.

## MOUNTING

Unless otherwise specified on the data sheets for individual tubes there are no restrictions on the position of mounting.
The tube socket should not be rigidly mounted but should have flexible leads and be allowed to move freely.
It is very desirable that tubes should not be exposed to strong electrostatic and magnetic fields.

## DIMENSIONS

In designing the equipment the tolerances given on the dimensional drawings should be considered. Under no circumstances should the equipment be designed around dimensions taken from individual tubes.

## TYPE DESIGNATION

## Pro electron type designation system

## Worldwide type designation system

Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $7,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $311,4 \mathrm{~mm} \times 243,2 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,6 \mathrm{~mm} ; x=126,98 \mathrm{~mm}, y=90,76 \mathrm{~mm}$.
7. Maximum dimensions in plane of lugs.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

| negative | $-V_{k}$ | $\max$. 0 V |  |
| negative peak | $-V_{k p}$ | max. 2 V |  |
| Heater voltage | $V_{f}$ | 6,3V $+5 \%$ | notes 1 and 6 |
| Heater-cathode voltage heater negative with respect to cathode after equipment warm-up period | $V_{k f}$ | max. 200 V |  |
| heater positive with respect to cathode | $-V_{k f p}$ | peak 200 V | note 1 |
|  | $-V_{k f}$ | $\max \quad 0 \mathrm{~V}$ <br> (d.c. component | value) |

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 12 kV $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle 4 mm

Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle 2 mm
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 4 mm

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 630 V ;
$\mathrm{V}_{\mathrm{k}}$ range 100 to 125 V .
Adjustment procedure:
Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 125 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 300 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

Cathode heating time after switching on, measured under typical operating conditions.

Typical cathode drive characteristics.

$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 4}=23 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=100 \mathrm{~V}$ (curve a ), $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$ (curve b).

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$V_{a, g 4}=23 \mathrm{kV}, \mathrm{V}_{\mathrm{f}}=6,3 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 3}$ adjusted for optimum focus.
Scanned area $=280,8 \mathrm{~mm} \times 210,6 \mathrm{~mm}$; CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.
Colour co-ordinates:

|  | $\frac{x}{x}$ |  | $y$ |
| :--- | :--- | :--- | :--- |
| red | 0,635 |  | 0,340 |
| green | 0,315 |  | 0,600 |
| blue | 0,150 |  | 0,060 |

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .

For proper degaussing an initial magnetomotive force (m.m.f.) of $\mathbf{6 0 0}$ ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil $(\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

Degaussing circuit using dual PTC thermistor.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line, thermally stable hi-bi potential A R $T^{*}$ gun
- 22,5 mm neck diameter
- Hi-Bri technology
- Pigmented phosphors
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick heating low-power cathodes
- Soft-flash technology
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- Combined with a deflection unit of the AT1625 series, it forms a self-converging and raster correction free assembly

## Notes to outline drawings in the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $7,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $311,4 \mathrm{~mm} \times 243,2 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,6 \mathrm{~mm} ; x=126,98 \mathrm{~mm}, y=90,76 \mathrm{~mm}$.
7. Maximum dimensions in plane of lugs.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

Reference line gauge; G-R90CJ10

average 1,1
max. 1,4
min. 1,1
average 1,5
max. 1,9
$\min$. 0,5
average 0,7
max. 0,9

* For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

LIMITING VALUES (Design maximum rating system unless otherwise stated)
The voltages are specified with respect to grid 1.

| Anode voltage | $V_{a, g 4}$ | max. <br> min. | $\begin{array}{r} 27,5 \mathrm{kV} \\ 20 \mathrm{kV} \end{array}$ | notes 1, 2, 3 <br> notes 1 and 4 |
| :---: | :---: | :---: | :---: | :---: |
| Long-term average current for three guns | $\mathrm{I}_{\mathrm{a}}$ | max. | $750 \mu \mathrm{~A}$ | note 5 |
| Grid 3 (focusing electrode) voltage | $\mathrm{V}_{\mathrm{g} 3}$ | max. | 11 kV |  |
| Grid 2 voltage, peak | $V_{\mathrm{g} 2 p}$ | max. | 1000 V |  |
| Cathode voltage positive | $\mathrm{V}_{\mathrm{k}}$ | max. | 400 V |  |
| positive operating cut-off | $V_{k}$ | max. | 200 V |  |
| negative | $-V_{k}$ | max. | 0 V |  |
| negative peak | $-V_{k p}$ | max. | 2 V |  |
| Heater voltage | $V_{f}$ | 6,3 V | $+5 \%$ $-10 \%$ | notes 1 and 6 |

Heater-cathode voltage
heater negative with respect to cathode
after equipment warm-up period
heater positive with respect to cathode

| $V_{k f}$ | max. 200 V |
| :--- | :--- |
| $-V_{k f p}$ | peak 200 V |
| $-V_{k f}$ | max. $\quad 0 \mathrm{~V}$ |
|  | (d.c. component value) |

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 12 kV $\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\min .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction
$0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle

4 mm
Centre convergence displacement between the green beam
and converged blue and red beams is contained within a circle; maximum diameter of circle

2 mm
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 685 V ;
$\mathrm{V}_{\mathrm{k}}$ range 100 to 125 V .

## Adjustment procedure:

Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 125 V ; increase the grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) from approx. 300 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

Cathode heating time after switching on, measured under typical operating conditions.

Typical cathode drive characteristics.

$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 4}=23 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=100 \mathrm{~V}$ (curve a ), $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$ (curve b).

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=23 \mathrm{kV}, \mathrm{V}_{\mathrm{f}}=6,3 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 3}$ adjusted for optimum focus.
Scanned area $=280,8 \mathrm{~mm} \times 210,6 \mathrm{~mm}$; CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

Colour co-ordinates:

|  | $\frac{x}{x}$ |  | $y$ |
| :--- | :---: | :---: | :---: |
| red | 0,635 |  | 0,340 |
| green | 0,315 |  | 0,600 |
| blue | 0,150 |  | 0,060 |

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .

For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil ( $\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

Degaussing circuit using dual PTC thermistor.

| Data of degaussing coil | 110 V (a.c.) mains | 220 V (a.c.) mains |
| :--- | :--- | :--- |
|  | 90 cm | 90 cm |
| Circumference | 60 | 120 |
| Number of turns | $0,45 \mathrm{~mm}$ | $0,3 \mathrm{~mm}$ |
| Copper wire diameter | $6 \Omega$ | $27 \Omega$ |
| Resistance | 232266298013 | 232266298009 |
| Catalogue number of <br> appropriate dual PTC thermistor |  |  |

## DEFLECTION UNIT

## QUICK REFERENCE DATA

| Picture tube |  |

| Field deflection current, edge to edge at 23 kV | $0,38 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Resistance of field coils, series connected | $54,4 \Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A34EACOOX, with a neck diameter of $22,5 \mathrm{~mm}$. The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $22,5_{-0,7}^{+1,4} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1301 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection unit and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection unit to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## FLAT SQUARE Hi-Bri COLOUR PICTURE TUBE

- Flat and square screen
- $90^{\circ}$ deflection
- In-line, hi-bi potential A R T* gun
- $22,5 \mathrm{~mm}$ neck diameter
- Shadow mask of NiFe alloy with low thermal expansion
- Hi-Bri technology
- Mask with corner suspension
- Pigmented phosphors
- Fine pitch over entire screen
- Quick-heating low-power cathodes
- Soft flash
- Slotted shadow mask optimized for minimum moiré at 625 lines system
- Internal magnetic shield
- Internal multipole
- Reinforced envelope for push-through mounting
- The tube is supplied with a deflection unit of the AT6060 series; it forms a self-converging and raster correction free assembly

Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,5 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. corners of a rectangle of $326,4 \mathrm{~mm} \times 261 \mathrm{~mm}$.
6. Distance from point $Z$ to any hardware.
7. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
8. Small cavity contact J1-21, IEC 67-III-2.
9. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

## TYPICAL OPERATING CONDITIONS

The voltages are specified with respect to grid 1.
Anode voltage
$V_{a, g 4}$
23 kV
Grid 3 (focusing electrode) voltage
Grid 2 voltage for a spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=120 \mathrm{~V}$

| $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}$ | 6,7 to $7,6 \mathrm{kV}$ |
| :--- | ---: |
| $\mathrm{V}_{\mathrm{g} 2}$ | 310 to 650 V |

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 685 V ;
$\mathrm{V}_{\mathrm{k}}$ range 100 to 125 V .
Adjustment procedure:
Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 125 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 300 V to the value at which one of the colours become just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

## EQUIPMENT DESIGN VALUES

The values are valid for anode voltages between 20 and $27,5 \mathrm{kV}$. The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. The X -ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 12 kV $\left(1,5 \times V_{g 3} \max\right.$. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

Cathode heating time after switching on, measured under typical operating conditions.

Typical cathode drive characteristics.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 4}=23 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=100 \mathrm{~V}$ (curve a), and $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$ (curve b). For optimum picture performance it is recommended that the cathodes are not driven below +1 V .

Luminance at the centre of the screen as
a function of $I_{\text {total }}$.
$\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=23 \mathrm{kV}$.
Scanned area $=404,4 \mathrm{~mm} \times 303,3 \mathrm{~mm}$;
CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| Colour co-ordinates: |  | $y$ |
| :--- | :---: | :---: |
| red | 0,635 | 0,340 |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil $(\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

Degaussing circuit using dual PTC thermistor.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, electrostatic bi-potential focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphor featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal maqnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1205), it forms a self-converging assembly; dynamic convergence is not required.

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. $1,5 \mathrm{~mm}$. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $7,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $311,4 \mathrm{~mm} \times 243,2 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,6 \mathrm{~mm}: x=126,98 \mathrm{~mm}, y=90,76 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis. The mass of the mating socket with circuitry should not be more than 150 g , maximum permissible torque is 40 mNm .
9. Small cavity contact J1-21, IEC67-III-2,

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $8,5 \mathrm{kV}$ $\left(1,5 \times V_{g 3}\right.$ max. at $\left.V_{a, g 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil ( $\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

Degaussing circuit using dual PTC thermistor.

| Field deflection current, edge to edge at 25 kV | $0,42 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Resistance of field coils, series connected | $50 \Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence, is for $90^{\circ}$ in-line colour picture tube A37-573X, with a neck diameter of $29,1 \mathrm{~mm}$.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1_{-0,7}^{+0,9} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## A37-590X

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, thermally stable; electrostatic hi-bi potential focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphor featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1206), it forms a self-converging and raster correction free assembly.

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its iimiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for 6,3 V at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 11 kV $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remairing circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle

4 mm
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle

2 mm
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 5 mm

Spot cut-off design chart (cathode drive), $\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus, $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=20$ to $27,5 \mathrm{kV}$,

Typical cathode drive characteristics.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{K}}=140 \mathrm{~V}$.

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}, \mathrm{V}_{\mathrm{f}}=6,3 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 3}$ adjusted for optimum focus.
Scanned area $=280,8 \mathrm{~mm} \times 210,6 \mathrm{~mm}$;
CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

Cathode heating time after switching on, measured under typical operating conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil ( $\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

Degaussing circuit using dual PTC thermistor.

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A37-590X, with a neck diameter of $29,1 \mathrm{~mm}$.
The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils, and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## A37-591X

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, thermally stable; electrostatic hi-bi potential focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphor featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1206), it forms a self-converging and raster correction free assembly.

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

[^9]
## MECHANICAL DATA

Notes are given after the drawings.

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $+1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $7,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $311,4 \mathrm{~mm} \times 243,2 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,6 \mathrm{~mm}: x=126,98 \mathrm{~mm}, y=90,76 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
The mass of the mating socket with circuitry should not be more than 150 g , maximum permissible torque is 40 mNm .
9. Small cavity contact J1-21, IEC67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

* The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 150 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 400 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $\mathrm{V}_{\mathrm{k}}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 11 kV $\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## Hi-Bri COLOUR PICTURE TUBE ASSEMBLIES

- The tube characteristics are identical to those of type A37-590X, see the relevant data sheet.
- Assembly A37-598X0620 consists of a picture tube with a light transmission at screen centre of 68\%, and deflection unit AT1206/20.
Assembly A37-599X0620 consists of a picture tube with a light transmission at screen centre of $46 \%$, and deflection unit AT1206/20.
- Enhanced convergence is obtained by improved and refined matching method.

## CONVERGENCE AND RASTER SPECIFICATION

The maximum convergence after 15 min operation is given in Table 1 and Fig. 1.
Test conditions (all voltages are measured with respect to grid 1)

| Heater voltage | $\mathrm{V}_{\mathrm{f}}$ | $6,3 \mathrm{~V}$ |
| :--- | :--- | :--- |
| Cathode voltage | $\mathrm{V}_{\mathrm{k}}$ | to be adjusted for correct current setting <br> Grid 2 voltage |
| $\mathrm{V}_{\mathrm{g} 2}$ 585 V <br> Grid 3 voltage  | $\mathrm{V}_{\mathrm{g} 3}$ | to be adjusted for focus in half east and half west, using a cross-hatch <br> pattern, when the beam current (black background) is adjusted to |
|  |  | $5 \mathrm{~mA}(\mathrm{p}-\mathrm{p})$ for white <br> 25 kV |
| Anode voltage |  |  |
| Cross-hatch pattern ( $350 \mu \mathrm{~A}(\mathrm{p}-\mathrm{p})$ for each gun) |  |  |

## Remarks

1. Misconvergence is the distance between centres of the red, green, blue lines at the screen using rectangular co-ordinates.
2. Anode and/or focusing voltage affect the static convergence performance. If the voltages are not the same as the test conditions mentioned, a minor convergence adjustment may become necessary. This can be done by readjusting the static convergence magnets.

Table 1 Maximum misconvergence after 15 min operation

| location (see Fig. 1) | max. error between <br> any colour |
| :--- | :---: |
| A | $0,3 \mathrm{~mm}$ |

| Inductance of line coils, parallel connected | 1,78 | mH |
| Field deflection current, edge to edge at 25 kV | 0,97 | $\mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Resistance of field coils, parallel connected | 11 | $\Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A37-590X, with a neck diameter of $29,1 \mathrm{~mm}$.
The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils, and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

## MECHANICAL DATA

Outlines
The deflection unit fits a tube with a neck diameter of $29,1 \begin{aligned} & +0,9 \\ & -0,7\end{aligned} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line, thermally stable hi-bi potential gun
- 22,5 mm neck diameter
- Hi-Bri technology
- Pigmented phosphors
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick heating low-power cathodes
- Soft-Flash technology
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- Combined with a deflection unit of the AT1635 series, it forms a self-converging and raster correction free assembly

## QUICK REFERENCE DATA

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $11,5 \mathrm{~mm}$ diamter drawn around the true geometrical positions, i.e. the corners of a rectangle of $355,8 \mathrm{~mm} \times 276,7 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,1 \mathrm{~mm} ; x=146,52 \mathrm{~mm}, y=104,72 \mathrm{~mm}$.
7. Maximum dimensions in plane of lugs.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 12 kV $\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.

Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle $\quad 4,5 \mathrm{~mm}$
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle 2,3 mm
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 4 mm

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 630 V ;
$\mathrm{V}_{\mathrm{k}}$ range 100 to 125 V .

## Adjustment procedure:

Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 125 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 300 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaning guns so that the other colours also become visible.

Cathode heating time after switching on, measured under typical operating conditions.

Typical cathode drive characteristics.
$V_{f}=6,3 \mathrm{~V}$;
$V_{\mathrm{a}, 94}=23 \mathrm{kV}$;

$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=100 \mathrm{~V}$ (curve a), and $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$ (curve b).

Luminance at the centre of the screen as a function of $I_{\text {total }} . \mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=23 \mathrm{kV}, \mathrm{V}_{\mathrm{f}}=6,3 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 3}$ adjusted for optimum focus.
Scanned area $=322,1 \mathrm{~mm} \times 241,6 \mathrm{~mm}$; CIE co-ordinates $\mathrm{x}=0,313, \mathrm{y}=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus. Colour co-ordinates:

|  | $\frac{x}{y}$ | $\frac{y}{n}$red 0,635  <br> green 0,315  <br> blue 0,600  <br>  0,150 $\quad 0,060$ |

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil ( $\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

Degaussing circuit using dual PTC thermistor.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line, thermally stable hi-bi potential A R T* gun
- 22,5 mm neck diameter
- Hi-Bri technology
- Pigmented phosphors
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick heating low-power cathodes
- Soft-Flash technology
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- Combined with a deflection unit of the AT1635 series, it forms a self-converging and raster correction free assembly

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $11,5 \mathrm{~mm}$ diamter drawn around the true geometrical positions, i.e. the corners of a rectangle of $355,8 \mathrm{~mm} \times 276,7 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,1 \mathrm{~mm} ; x=146,52 \mathrm{~mm}, y=104,72 \mathrm{~mm}$.
7. Maximum dimensions in plane of lugs.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 12 kV $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle $4,5 \mathrm{~mm}$
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle 2,3 mm
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

4 mm

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 685 V ;
$\mathrm{V}_{\mathrm{k}}$ range 100 to 125 V .
Adjustment procedure:
Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 125 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 300 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaning guns so that the other colours also become visible.

Cathode heating time after switching on, measured under typical operating conditions.

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A38EACOOX, with a neck diameter of $22,5 \mathrm{~mm}$. The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $22,5_{-0,7}^{+1,4} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1301 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection unit and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection unit to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## DEFLECTION UNIT

## QUICK REFERENCE DATA

| Picture tube | in line |
| :--- | :--- |
| $\quad$ gun arrangement | 38 cm |
| minimum useful screen diagonal | $22,5 \mathrm{~mm}$ |
| neck diameter | 900 |
| Deflection angle | $2,21 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Line deflection current, edge to edge at 23 kV | $2,50 \mathrm{mH}$ |
| Inductance of line coils, parallel connected (including additional coil) | $0,78 \mathrm{~A} \mathrm{(p-p)}$ |
| Field deflection current, edge to edge at 23 kV | $11,8 \Omega$ |
| Resistance of field coils, parallel connected |  |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A38EAC00X, with a neck diameter of $22,5 \mathrm{~mm}$. The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## Outlines

The deflection unit fits a tube with a neck diameter of $22,5_{-0,7}^{+1,4} \mathrm{~mm}$.

## FLAT SQUARE Hi-Bri COLOUR PICTURE TUBE

- Flat and square screen
- $90^{\circ}$ deflection
- In-line, hi-bi potential A R T* gun
- 22,5 mm neck diameter
- Shadow mask of NiFe alloy with low thermal expansion
- Hi-Bri technology
- Mask with corner suspension
- Pigmented phosphors
- Fine pitch over entire screen
- Quick-heating low-power cathodes
- Soft flash
- Slotted shadow mask optimized for minimum moiré at 625 lines system
- Internal magnetic shield
- Internal multipole
- Reinforced envelope for push-through mounting
- The tube is supplied with a deflection unit of the AT6050 series; it forms a self-converging and raster correction free assembly

## QUICK REFERENCE DATA

| Deflection angle | $90^{\circ}$ |

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs.

This deviation is incorporated in the tolerance of $\pm 1,5 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. corners of a rectangle of $367 \mathrm{~mm} \times 291,5 \mathrm{~mm}$.
6. Distance from point $Z$ to any hardware.
7. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
8. Small cavity contact J1-21, IEC 67-III-2.
9. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

## TYPICAL OPERATING CONDITIONS

The voltages are specified with respect to grid 1.

| Anode voltage | $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}$ | 23 kV |
| :--- | :--- | ---: |
| Grid 3 (focusing electrode) voltage | $\mathrm{V}_{\mathrm{g} 3}$ | 6,7 to $7,6 \mathrm{kV}$ |
| Grid 2 voltage for a spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=120 \mathrm{~V}$ | $\mathrm{~V}_{\mathrm{g} 2}$ | 310 to 650 V |

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 685 V ;
$\mathrm{V}_{\mathrm{k}}$ range 100 to 125 V .
Adjustment procedure:
Set the cathode voltage ( $\mathrm{V}_{\mathrm{k}}$ ) for each gun at 125 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 300 V to the value at which one of the colours become just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 12 kV $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 3 mm

Cathode heating time after switching on, measured under typical operating conditions.

Typical cathode drive characteristics.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 4}=23 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=100 \mathrm{~V}$ (curve a), and $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$ (curve b). For optimum picture performance it is recommended that the cathodes are not driven below +1 V .

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=23 \mathrm{kV}$.
CIE
CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| Colour co-ordinates: | x | y |

| red | 0,635 | 0,340 |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil ( $\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, electrostatic bi-potential focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphor featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1215), it forms a self-converging assembly; dynamic convergence is not required.

## MECHANICAL DATA (continued)

Dimensions in mm
Notes are given after the drawings.

MECHANICAL DATA (continued)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs.

This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $7,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $355,8 \mathrm{~mm} \times 276,7 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,1 \mathrm{~mm}: x=146,52 \mathrm{~mm}, y=104,72 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC67-111-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

* The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 120 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 300 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $V_{k}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

LIMITING VALUES (Design maximum rating svstem unless otherwise stated)
The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \vee$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $8,5 \mathrm{kV}$ $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle $4,5 \mathrm{~mm}$

Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle 2,3 mm
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 5 mm

Spot cut-off design chart (cathode drive), $\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus, $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=20$ to $27,5 \mathrm{kV}$.

Cathode heating time after switching on, measured under typical operating conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil ( $\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

Degaussing circuit using dual PTC thermistor.

| Field deflection current, edge to edge at 25 kV | $0,87 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Resistance of field coils, parallel connected | $12,2 \Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence, is for $90^{\circ}$ in-line colour picture tube A42-570X, with a neck diameter of $29,1 \mathrm{~mm}$.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1_{-0,7}^{+0,9} \mathrm{~mm}$.
For correct fitting the tube neck should be provided with adhesive tape.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.
- 

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, thermally stable; electrostatic hi-bi-potential focus
- $29,1 \mathrm{~mm}$ neck diameter
- Hi-Bri screen with pigmented phosphor featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1216 or AT1470), it forms a self-converging and raster correction free assembly.

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

* In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

## MECHANICAL DATA (continued)

## Notes are given after the drawings.

## MECHANICAL DATA (continued)

7Z95513.1

i.c. $=$ internally connected (not to be used)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $11,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $355,8 \mathrm{~mm} \times 276,7 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,1 \mathrm{~mm}: x=146,52 \mathrm{~mm}, \mathrm{y}=104,72 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

* The common $V_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 150 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 400 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $\mathrm{V}_{\mathrm{k}}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for 6,3 V at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 11 kV $\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle $4,5 \mathrm{~mm}$
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle $2,3 \mathrm{~mm}$
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

5 mm

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil $(\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

| Field deflection current, edge to edge at 25 kV | $11 \Omega$ |
| Resistance of field coils, parallel connected |  |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A42-592X, with a neck diameter of $29,1 \mathrm{~mm}$.
The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils, and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1 \begin{gathered}+0,9 \\ -0,7\end{gathered} \mathrm{~mm}$.

## ELECTRICAL DATA

Line coils
Inductance at 1 V (r.m.s.), 1 kHz
Resistance at $25^{\circ} \mathrm{C}$
Line deflection current, edge to edge at 25 kV
Voltage during line scan, edge to edge, at 25 kV , scan period $52,5 \mu \mathrm{~s}$
Field coils
Inductance at 1 V (r.m.s.), 1 kHz
Resistance at $25^{\circ} \mathrm{C}$
Field deflection current, edge to edge at 25 kV
Cross-talk

Fig. 2 Connection diagram, $L=$ Line,$F=$ Field.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## DEFLECTION UNIT

## - Raster Correction Free

## QUICK REFERENCE DATA

| Resistance of field coils, parallel connected | $0,9 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
|  | $13,9 \Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A42-592X, with a neck diameter of $29,1 \mathrm{~mm}$.
The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal nonmagnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1{ }_{-0,7}^{+0,9} \mathrm{~mm}$.
For correct fitting the tube neck should be provided with adhesive tape.

- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, thermally stable; electrostatic hi-bi-potential focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphor featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1216 or AT1470). it forms a self-converging and raster correction free assembly.

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

* In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

## MECHANICAL DATA (continued)

Notes are given after the drawings.

Hi -Bri colour picture tube

## A42-593X

MECHANICAL DATA (continued)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,5 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $11,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle $355,8 \mathrm{~mm} \times 276,7 \mathrm{~mm}$.
6. Co-ordinates for radius $R=11,1 \mathrm{~mm}: x=146,52 \mathrm{~mm}, \mathrm{y}=104,72 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-111-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

average 0,7
max. 0,9

* The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $V_{k}$, for each gun at 150 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 400 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $\mathrm{V}_{\mathrm{k}}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

LIMITING VALUES (Design maximum rating system unless otherwise stated)
The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1000 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 11 kV $\left(1,5 \times V_{g 3}\right.$ max. at $\left.V_{a, g 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$

Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle $4,5 \mathrm{~mm}$
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle
$2,3 \mathrm{~mm}$
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

5 mm

Spot cut-off design chart (cathode drive), $\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus, $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=20$ to $27,5 \mathrm{kV}$.

Typical cathode drive characteristics.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$.

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}, \mathrm{V}_{\mathrm{f}}=6,3 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 3}$ adjusted for optimum focus.
Scanned area $=322,1 \mathrm{~mm} \times 241,6 \mathrm{~mm}$;
CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus. Colour co-ordinates:
red

| 0,315 |  | 0,600 |
| 0,150 |  | 0,060 |

Cathode heating time after switching on, measured under typical operating conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of one magnetic coil winding mounted on the cone of the picture tube.

Position of degaussing coil on the picture tube; dimensions are given in mm .
For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coil $(\leqslant 0,6$ ampere-turns). If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents. An example of a degaussing circuit and coil data for various mains voltages are given below.

| Inductance of line coils, parallel connected | $0,47 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Field deflection current, edge to edge at 25 kV | $44 \Omega$. |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tubes A42-592X and A42-593X, with a neck diameter of $29,1 \mathrm{~mm}$.
The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils, and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1{ }_{-0,7}^{+0,9} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## DEFLECTION UNIT

## - Raster Correction Free

## QUICK REFERENCE DATA

| Picture tube |  |
| :--- | :--- |
| gun arrangement | in line |
| diagonal | $42 \mathrm{~cm}(16 \mathrm{in})$ |
| neck diameter | $29,1 \mathrm{~mm}$ |
| Deflection angle | $90^{\circ}$ |
| Line deflection current, edge to edge at 25 kV | $3,04 \mathrm{~A} \mathrm{p-p}$ |
| Inductance of line coils, parallel connected | $1,89 \mathrm{mH}$ |
| Field deflection current, edge to edge at 25 kV | $0,45 \mathrm{~A}(\mathrm{p-p})$ |
| Resistance of field coils, series connected | $55,6 \Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tubes A42-592X and A42-593X, with a neck diameter of $29,1 \mathrm{~mm}$. The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal nonmagnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1 \begin{aligned} & +0,9 \\ & -0,7\end{aligned} \mathrm{~mm}$.
For correct fitting the tube neck should be provided with adhesive tape.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line, thermally stable hi-bi potential gun
- 22,5 mm neck diameter
- Hi-Bri technology
- Pigmented phosphors
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick heating low-power cathodes
- Soft-Flash technology
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- Combined with a deflection unit of the AT1645 series, it forms a self-converging and raster correction free assembly

## QUICK REFERENCE DATA

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( 2 mm max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 2,5 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $434 \mathrm{~mm} \times 337 \mathrm{~mm}$.
6. Co-ordinates for radius $R=13,1 \mathrm{~mm} ; x=184,58 \mathrm{~mm}, y=131,93 \mathrm{~mm}$.
7. Distance from point $Z$ to any hardware.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

LIMITING VALUES (Design maximum rating system unless otherwise stated)
The voltages are specified with respect to grid 1.

|  |  | max. | $27,5 \mathrm{kV}$ | notes $1,2,3$ |
| :--- | :--- | :--- | ---: | :--- |
| Anode voltage |  |  |  |  |
| notes 1 and 4 |  |  |  |  |

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for 6,3 V at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 12 kV $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle 5 mm
Centre convergence displacement between the green beam and converged blue and red beams is contained within a
circle; maximum diameter of circle

2,5 mm
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

5 mm

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 685 V ;
$\mathrm{V}_{\mathrm{k}}$ range 100 to 125 V .

## Adjustment procedure:

Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 125 V ; increase the grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) from approx. 300 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

Cathode heating time after switching on, measured under typical operating conditions.

Typical cathode drive characteristics.
$V_{f}=6,3 \mathrm{~V}$;

$V_{a, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=100 \mathrm{~V}$ (curve a ), and $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$ (curve b).

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$V_{a, g 4}=25 \mathrm{kV}$.
Scanned area $=404,4 \mathrm{~mm} \times 303,3 \mathrm{~mm}$;
CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| Colour co-ordinates: | $x$ | $y$ |
| :--- | :---: | :---: |
| red | 0,635 | 0,340 |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil shaped in the form of a figure eight, with one half on the top and the other half on the bottom cone part.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils $(\leqslant 0,3$ ampere-turns).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

Degaussing circuit using dual PTC thermistor.

| Line deflection current, edge to edge at 25 kV | $2,50 \mathrm{mH}$ |
| Inductance of line coils, parallel connected | $0,81 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Field deflection current, edge to edge at 25 kV | $11,8 \Omega$ |
| Resistance of field coils, parallel connected |  |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for 900 in-line colour picture tube A48EAC00X, with a neck diameter of $22,5 \mathrm{~mm}$. The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1301 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection unit and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection unit to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## DEFLECTION UNIT

## 30AX COLOUR PICTURE TUBE

- Automatic snap-in raster orientation
- Push-on axial purity positioning
- Internal magneto-static beam alignment
- Hi-Bi gun with quadrupole cathode lens
- Self-aligning, self-converging assembly with low power consumption, when combined with deflection unit AT 1850
- North-south pin-cushion distortion-free
- $110^{\circ}$ deflection
- Hi-Bri screen
- Pigmented phosphors: enhanced contrast
- Phosphor lines follow glass contour
- In-line gun
- Standard 36,5 mm neck
- Soft-Flash technology
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Quick-heating cathodes
- Internal magnetic shield
- Anti-crackle coating
- Reinforced erivelope for push-through mounting

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than $350 \mathrm{~m} / \mathrm{s}^{2}$ in any direction.

* Tube settings adjusted to produce white $D(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

## MECHANICAL DATA (continued)

Notes are given after the drawings.

Bulb dimensions at mould match line.

MECHANICAL DATA (continued)

Notes to outline drawings on the preceding pages

1. This ridge can be used as an orientation for the deflection unit.
2. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
3. To clean this area, wipe only with a soft lintless cloth.
4. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm .
5. Minimum space to be reserved for mounting lug.
6. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $434 \mathrm{~mm} \times 337 \mathrm{~mm}$.
7. Co-ordinates for radius $R=13,1 \mathrm{~mm}: x=184,58 \mathrm{~mm}, y=131,93 \mathrm{~mm}$.
8. Distance from point $z$ to any hardware.
9. Maximum dimensions in plane of lugs.
10. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. The bottom circumference of the base will fall within a circle concentric with the tube axis and having a diameter of 55 mm .
The mass of the mating socket with circuitry should not be more than 150 g ; maximum permissible torque is 40 mNm .
11. Minimum distance between glass and rimband in plane of centre line of apertures.
12. Centring bosses for deflection unit.

RECOMMENDED OPERATING CONDITIONS (cathode drive)
The voltages are specified with respect to grid 1.

## Anode voltage

Grid 3 (focusing electrode) voltage

$$
\begin{array}{ll}
\mathrm{V}_{\mathrm{a}, \mathrm{~g} 5, \mathrm{~g} 4} & 25 \mathrm{kV} \\
\mathrm{~V}_{\mathrm{g} 3} & 6,5 \text { to } 7,45 \mathrm{kV}
\end{array}
$$

## A. Operation at equal spot cut-off voltage $\mathrm{V}_{\mathbf{k}}=140 \mathrm{~V}$

Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for each gun separately; $\mathrm{V}_{\mathrm{g} 2}$ range 590 to 800 V .

Spot cut-off design chart.

Typical cathode drive characteristic.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 5, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$.

## B. Operation at equal grid 2 voltage

Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=150 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage.
$\mathrm{V}_{\mathrm{g} 2}$ range 630 to 860 V .
$\mathrm{V}_{\mathrm{k}}$ range 120 to 150 V .

## Adjustment procedure:

Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 150 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 600 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

Spot cut-off design chart.

Typical catrode drive characteristic.
$V_{f}=6,3 \mathrm{~V}$ :
$V_{a, g 5, g 4}=25 \mathrm{kV}$;
$V_{g 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=120 \mathrm{~V}$ and 150 V .

EQUIPMENT DESIGN VALUES (each gun if applicable)
The values are valid for anode voltages between 22,5 and $27,5 \mathrm{kV}$. The voltages are specified with respect to grid 1.

Grid 3 (focusing electrode) voltage

Difference in cut-off voltage between guns in one tube

## BEAM CENTRING

Maximum centring error in any direction
$4,5 \mathrm{~mm}$

## LIMITING VALUES (each gun if applicable)

Design maximum rating system unless otherwise stated.
The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.

6 . During adjustment on the production line max. 1500 V is permitted.
7. For maximum cathode life and optimum performance it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

High electric field strengths are present between the gun electrodes of picture tubes. Voltages between gun electrodes may reach values of 20 kV over approx. 1 mm . As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.

Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage and damage to the circuitry which is directly connected to the tube socket. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $10,5 \mathrm{kV}$, and at the other electrodes of 1,5 to 2 kV . The values of the series isolation resistors should be as high as possible (min $1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

Luminance at the centre of the screen as a function of $I_{\text {total }}$. Scanned area $518 \mathrm{~mm} \times 390 \mathrm{~mm}$.

Cathode heating time to attain a certain percentage of the cathode current at equilibrium conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts.
For proper degaussing an initial magnetomotive force (m.m.f.) of 250 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate circuitry. To prevent beam landing disturbances by line-frequency currents induced in the degaussing coils, these coils should be shunted by a capacitor of sufficiently high value. In the steady state, no significant m.m.f. should remain in the coils $(\leqslant 0,25$ ampere turns).
If single-phase power rectification is employed in the TV circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
To ease the mounting of the coils, the rimband is provided with rectangular holes. An example is given below.

Position of degaussing coils on the picture tube.

## APPLICATION

This deflection unit has been designed for use with a $110^{\circ}$ colour picture tube type A51-540X in CTV receivers in conjunction with e.g.:
diode-split line output transformer AT2076/70A
line output transistor BU208A
linearity control unit AT4042/42

## DESCRIPTION

The deflection unit consists of flangeless line and field coils, a one piece ferrite ring and a one piece coil carrier.

## Mounting

The deflection unit can simply be pushed on the neck of a picture tube.
Both on the neck of the tube and on the deflection unit, there are 3 reference surfaces to establish angular and axial positioning.
Once the unit is mounted the combination is perfectly aligned and requires no further adjustment for static convergence, colour purity and raster orientation.
The unit must be pressed against the reference surfaces on the cone of the picture tube with a force of $20 \pm 5 \mathrm{~N}$ and fixed by tightening the screw in the clamping ring at the rear with a torque of $1,0_{-0,2}^{+0,4} \mathrm{Nm}$. Maximum axial force exerted on the screw is 20 N .

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, electrostatic bi-potential focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphors featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moire
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1237), it forms a self-converging assembly; dynamic convergence is not required.

Notes are given after the drawings.

i.c. = internally connected (not to be used)
n.c. $=$ not connected

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. $2 \mathbf{~ m m}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $434 \mathrm{~mm} \times 337 \mathrm{~mm}$.
6. Co-ordinates for radius $R=13,1 \mathrm{~mm} ; x=184,58 \mathrm{~mm}, y=131,93 \mathrm{~mm}$.
7. Maximum dimensions in plane of lugs.
8. The socket for this base should not be rigidly mounted: it should have flexible leads and be allowed to move freely. The bottom circumference of base will fall within a circle concentric with the tube axis and having a diameter of 50 mm .
9. Small cavity contact J1-21, IEC67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.
11. Minimum distance between glass and rimband in plane of centre line apertures.
12. Distance from point $z$ to any handware.

Reference line gauge; GR90CJ4

| 1,1 | 1,5 | 2,0 |
| 0,5 | 0,7 | 1,0 |

* The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 120 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 300 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $V_{k}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

LIMITING VALUES (Design maximum rating system unless otherwise stated)
The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $8,5 \mathrm{kV}$ $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\min .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle 5 mm

Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle $2,5 \mathrm{~mm}$
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

5 mm

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic, degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil shaped in the form of a figure eight, with one half on the top and the other half on the bottom cone part.

For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.

Examples of a double-coil and of a single-coil system are given below.

| Field deflection current, edge to edge at 25 kV | $0,40 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Resistance of field coils, series connected | $60 \Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A51-570X, with a neck diameter of $29,1 \mathrm{~mm}$.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1{ }_{-0,7}^{+0,9} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, electrostatic hi-bi potential for improved focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphors featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1237), it forms a self-converging assembly; dynamic convergence is not required.

MECHANICAL DATA (continued)

i.c. $=$ internally connected (not to be used)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm .
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $434 \mathrm{~mm} \times 337 \mathrm{~mm}$.
6. Co-ordinates for radius $R=13,1 \mathrm{~mm}: x=184,58 \mathrm{~mm}, \mathrm{y}=131,93 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.
11. Minimum distance between glass and rimband in plane of centre line apertures.
12. Distance from point $z$ to any hardware.

* The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 150 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 400 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $\mathrm{V}_{\mathrm{k}}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

LIMITING VALUES (Design maximum rating system unless otherwise stated)
The voltages are specified with respect to grid 1.

| Anode voltage | $V_{a, g 4}$ | max. <br> $\min$. | $\begin{array}{r} 27,5 \mathrm{kV} \\ 20 \mathrm{kV} \end{array}$ | notes 1, 2 and 3 note 4 |

|  | $-V_{k f}$ | max. | 0 V |  |
|  |  | (d.c. c | mponent va |  |

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerable. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $11,5 \mathrm{kV}$ $\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$

Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle

5 mm
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle $2,5 \mathrm{~mm}$
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 5 mm

Spot cut-off design chart (cathode drive), $\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus, $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=20$ to $27,5 \mathrm{kV}$.

Typical cathode drive characteristics
$V_{f}=6,3 \mathrm{~V}$
$V_{a, g 4}=25 \mathrm{kV}$
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus
$\mathrm{V}_{\mathrm{g} 2}$ adjusted to provide spot
cut-off for $\mathrm{V}_{\mathrm{K}}=140 \mathrm{~V}$

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$V_{a, g 4}=25 \mathrm{kV}$.
Scanned area $=404,4 \mathrm{~mm} \times 303,3 \mathrm{~mm}$;
CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.
Colour co-ordinates:

| red | 0,635 | 0,340 |
| :--- | :--- | :--- |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

Cathode heating time after switching on, measured under typical operating conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil shaped in the form of a figure eight, with one half on the top and the other half on the bottom cone part.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.

Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

## APPLICATION

This deflection unit is designed for $90^{\circ}$ in-line colour picture tube A51-580X, with a neck diameter of $29,1 \mathrm{~mm}$, to operate in conjunction with devices for colour purity and static convergence.

## DESCRIPTION

The deflection unit consists of saddle-shaped horizontal coils and toroidal wound vertical coils, thus forming a hybrid yoke. The unit is provided with a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1{ }_{-0,7}^{+0,9} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tubes A51-570X and A51-580X, with a neck diameter of 29,1 mm.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils and toroidal wound field deflection coils, thus forming a hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube. With the deflection unit positioned axially for optimum purity, a clearance is available at the front which permits adjustment of convergence by tilting the unit in the vertical and/or horizontal plane. Wedges are recommended to secure the deflection unit in the chosen position.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1_{-0,7}^{+0,9} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges placed between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## DEFLECTION UNIT

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, thermally stable; electrostatic hi-bi potential for improved focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphors featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contour
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1236 or AT1480), it forms a self-converging and raster correction free assembly.

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

* In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

MECHANICAL DATA (continued)
Notes are given after the drawings.

February 1985

MECHANICAL DATA (continued)

i.c. $=$ internally connected (not to be used).

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm .

This deviation is incorporated in the tolerance of $\pm 2,5 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $434 \mathrm{~mm} \times 337 \mathrm{~mm}$.
6. Co-ordinates for radius $R=13,1 \mathrm{~mm}: x=184,58 \mathrm{~mm}, y=131,93 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.
11. Minimum distance between glass and rimband in plane of centre line apertures.
12. Distance from point $z$ to any hardware.

|  | -5 to $+5 \mu \mathrm{~A}$ |
| $\mathrm{I}_{\mathrm{g} 3}$ | -5 to $+5 \mu \mathrm{~A}$ |
| $\mathrm{I}_{\mathrm{g} 2}$ | -5 to $+5 \mu \mathrm{~A}$ |

To produce white D, CIE co-ordinates $x=0,313, y=0,329$.
Percentage of the total anode current supplied by each gun (typical)
red gun
38,3\%
green gun
35,8\%
blue gun
25,9\%
Ratio of anode currents

| red gun to green gun | min. | 0,8 |
| :--- | :--- | :--- |
|  | average | 1,1 |
| red gun to blue gun | max. | 1,4 |
|  | min. | 1,1 |
|  | average | 1,5 |
| blue gun to green gun | max. | 1,9 |
|  | min. | 0,5 |
|  | average | 0,7 |
|  | max. | 0,9 |

* The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 150 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 400 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $V_{k}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

LIMITING VALUES (Design maximum rating system unless otherwise stated)

## Notes

1. Absolute maximum rating system.
2. The X -ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerable. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode $(\mathrm{g} 3)$ of $11,5 \mathrm{kV}$ $\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$
Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle

5 mm
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle
$2,5 \mathrm{~mm}$
Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position

[^15]Hi-Bri colour picture tube

Spot cut-off design chart (cathode drive), $\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus, $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=20$ to $27,5 \mathrm{kV}$.

Typical cathode drive characteristics
$V_{f}=6,3 \mathrm{~V}$
$V_{a, g 4}=25 \mathrm{kV}$
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus
$\mathrm{V}_{\mathrm{g} 2}$ adjusted to provide spot
cut-off for $\mathrm{V}_{\mathrm{K}}=140 \mathrm{~V}$

Luminance at the centre of the screen as a function of $I_{\text {total }}$.
$V_{a, g 4}=25 \mathrm{kV}$.
Scanned area $=404,4 \mathrm{~mm} \times 303,3 \mathrm{~mm}$;
CIE co-ordinates $x=0,313, y=0,329$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| Colour co-ordinates: | $x$ | $y$ |
| :--- | :---: | :---: |
| red | 0,635 | 0,340 |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

Cathode heating time after switching on, measured under typical operating conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil shaped in the form of a figure eight, with one half on the top and the other half on the bottom cone part.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.

Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

| Field deflection current, edge to edge at 25 kV | $0,895 \mathrm{~A}(\mathrm{p}-\mathrm{p})$ |
| Resistance of field coils, parallel connected | $13,2 \Omega$ |

## APPLICATION

This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tube A51-590X, with a neck diameter of $29,1 \mathrm{~mm}$.
The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils, and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

## MECHANICAL DATA

## Outlines

The deflection unit fits a tube with a neck diameter of $29,1_{-0,7}^{+0,9} \mathrm{~mm}$.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges places between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

## Hi-Bri COLOUR PICTURE TUBE

- $90^{\circ}$ deflection
- In-line gun, thermally stable; electrostatic hi-bi potential for improved focus
- 29,1 mm neck diameter
- Hi-Bri screen with pigmented phosphors featuring high brightness and increased contrast performance
- Soft-Flash technology offering improved set reliability
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Phosphor lines follow glass contaur
- Quick-heating cathodes
- Internal magnetic shield
- Reinforced envelope for push-through mounting
- When combined with an appropriate hybrid saddle toroidal deflection unit (e.g. AT1236 or AT1480), it forms a self-converging and raster correction free assembly.

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

[^16]MECHANICAL DATA (continued)
Dimensions in mm
Notes are given after the drawings.

MECHANICAL DATA (continued)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm .

This deviation is incorporated in the tolerance of $\pm 2,5 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $434 \mathrm{~mm} \times 337 \mathrm{~mm}$.
6. Co-ordinates for radius $R=13,1 \mathrm{~mm}: x=184,58 \mathrm{~mm}, y=131,93 \mathrm{~mm}$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.
11. Minimum distance between glass and rimband in plane of centre line apertures.
12. Distance from point $z$ to any hardware.

Reference line gauge; GR90CJ4

## Base JEDEC B8-274

## TYPICAL OPERATING CONDITIONS

The voltages are specified with respect to grid 1.

Anode voltage
Grid 3 (focusing electrode) voltage
Grid 2 voltage for a spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$
Luminance at the centre of the screen*
$V_{a, g 4}$
25 kV
$V_{\mathrm{g} 3}$
$V_{g 2}$
390 to 760 V
$170 \mathrm{~cd} / \mathrm{m}^{2}$

* Tube settings adjusted to produce white $D(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

## EQUIPMENT DESIGN VALUES

The values are valid for anode voltages between 20 and $27,5 \mathrm{kV}$. The voltages are specified with respect to grid 1.
Grid 3 (focusing electrode) voltage
Grid 2 voltage and cathode voltage for visual extinction of focused spot
Difference in cut-off voltages between guns in any tube

Video drive characteristics
Grid 3 (focusing electrode) current
Grid 2 current
Grid 1 current under cut-off conditions

| $\mathrm{V}_{\mathrm{g} 3}$ | 26,6 to $29,8 \%$ of <br> anode voltage |
| :--- | :--- |
| $\mathrm{V}_{\mathrm{g} 2}$ and $\mathrm{V}_{\mathrm{k}}$ | see cut-off design chart* |
| $\Delta \mathrm{V}_{\mathrm{k}}$ | lowest value $>80 \%$ of <br> highest value <br> see graphs** |
|  | -5 to $+5 \mu \mathrm{~A}$ |
| $\mathrm{I}_{\mathrm{g} 3}$ | -5 to $+5 \mu \mathrm{~A}$ |
| $\mathrm{I}_{\mathrm{g} 2}$ | -5 to $+5 \mu \mathrm{~A}$ |
| $\mathrm{I}_{\mathrm{g} 1}$ |  |

To produce white D, CIE co-ordinates $\mathrm{x}=0,313, \mathrm{y}=0,329$.
Percentage of the total anode current supplied by each gun (typical)
red gun
38,3\%
green gun
35,8\%
blue gun
25,9\%
Ratio of anode currents
red gun to green gun
red gun to blue gun
blue gun to green gun

| min. | 0,8 |
| :--- | :--- |
| average | 1,1 |
| max. | 1,4 |
| min. | 1,1 |
| average | 1,5 |
| max. | 1,9 |
| min. | 0,5 |
| average | 0,7 |
| max. | 0,9 |

* The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 150 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 400 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $V_{k}$ of the remaining guns so that the rasters of these guns also become visible.
** For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

LIMITING VALUES (Design maximum rating system unless otherwise stated)
The voltages are specified with respect to grid 1.

| Anode voltage | $V_{a, g 4}$ | max. min. | $\begin{array}{r} 27,5 \mathrm{kV} \\ 20 \mathrm{kV} \end{array}$ | notes 1, 2 and 3 note 4 |
| :---: | :---: | :---: | :---: | :---: |
| Long-term average current for three guns | $l_{\text {a }}$ | max. | $1000 \mu \mathrm{~A}$ | note 5 |
| Grid 3 (focusing electrode) voltage | $\mathrm{V}_{\mathrm{g} 3}$ | max. | 11 kV |  |
| Grid 2 voltage, peak | $V_{g 2 p}$ | max. | 1000 V |  |
| Cathode voltage positive positive operating cut-off negative negative peak | $\begin{aligned} & V_{k} \\ & V_{k} \\ & -V_{k} \\ & -V_{k p} \end{aligned}$ | max. <br> max. <br> max. <br> max. | $\begin{array}{r} 400 \mathrm{~V} \\ 200 \mathrm{~V} \\ 0 \mathrm{~V} \\ 2 \mathrm{~V} \end{array}$ |  |
| Heater voltage | $V_{f}$ | 6,3 V | $\begin{aligned} & +5 \% \\ & -10 \% \end{aligned}$ | notes 1 and 6 |

| heater positive with respect to cathode | $\begin{aligned} & -V_{k f p} \\ & -V_{k f} \end{aligned}$ | peak max. (d.c. | $\begin{array}{r} 200 \text { V } \\ 0 \text { V } \end{array}$ <br> mponent va | note 1 <br> lue) |

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerable. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $11,5 \mathrm{kV}$ $\left(1,5 \times V_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum required correction for register, as measured at the centre of the screen in any direction $0,08 \mathrm{~mm}$

Centre convergence displacement of the blue and red beams is contained within a circle; max. diameter of circle

5 mm
Centre convergence displacement between the green beam and converged blue and red beams is contained within a circle; maximum diameter of circle $2,5 \mathrm{~mm}$

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 5 mm

Spot cut-off design chart (cathode drive), $\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus, $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=20$ to $27,5 \mathrm{kV}$.

| red | 0,635 | 0,340 |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

Cathode heating time after switching on, measured under typical operating conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil shaped in the form of a figure eight, with one half on the top and the other half on the bottom cone part.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.

Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

Relan
$1,91 \mathrm{mH}$

APPLICATION
This deflection unit, in conjunction with devices for colour purity and static convergence is for $90^{\circ}$ in-line colour picture tubes A51-590X and A51-591X, with a neck diameter of $29,1 \mathrm{~mm}$. The unit requires no raster correction circuitry.

## DESCRIPTION

The deflection unit consists of saddle-shaped line deflection coils, toroidal wound field deflection coils, and metal fins, thus forming a raster correction free hybrid yoke. The unit has a metal non-magnetic clamping ring at the rear, to fix the deflection unit on the neck of the picture tube.

## ADJUSTMENT

- Adjust the static convergence with the four and six-pole magnets of the multipole unit AT1052 for the relative movement of the beams under influence of a four or six-pole magnet.
- Adjust colour purity by axial movement of the deflection yoke and adjustment of the two-pole magnets for centring of the beams.
- Tighten the screw of the clamping ring on the deflection yoke to secure the axial position of the unit on the picture tube.
- Readjust, if necessary, the convergence with the four and six-pole magnets.
- Tilt the unit in either horizontal or vertical direction, or in both directions so that blue, green and red lines converge at the end of the horizontal and vertical axis.
- This position of the unit has to be secured by three rubber wedges places between the picture tube and the deflection unit. These wedges have to be cemented on to the picture tube.

DEVELOPMENT DATA

Notes to outline drawings on the preceding pages

1. The displacement of any lug with respect to the plane through the three other lugs is max. $1,5 \mathrm{~mm}$.
2. Minimum space to be reserved for mounting lug.
3. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $449 \mathrm{~mm} \times 354 \mathrm{~mm}$.
4. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.

## TYPICAL OPERATING CONDITIONS

The voltages are specified with respect to grid 1.

| Anode voltage | $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}$ | 25 kV |
| :--- | :--- | ---: |
| Grid 3 (focusing electrode) voltage | $\mathrm{V}_{\mathrm{g} 3}$ | 7,25 to $8,25 \mathrm{kV}$ |
| Grid 2 voltage for a spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=130 \mathrm{~V}$ | $\mathrm{~V}_{\mathrm{g} 2}$ | see below |
| Heater voltage under operating conditions | $\mathrm{V}_{\mathrm{f}}$ | $6,3 \mathrm{~V}$ |

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=130 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 575 to 825 V ;
$\mathrm{V}_{\mathrm{k}}$ range 105 to 130 V .
Adjustment procedure:
Set the cathode voltage ( $\mathrm{V}_{\mathrm{k}}$ ) for each gun at 130 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 550 V to the value at which one of the colours become just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

## EQUIPMENT DESIGN VALUES

The values are valid for anode voltages between 20 and $27,5 \mathrm{kV}$. The voltages are specified with respect to grid 1.

## BEAM CENTRING

Maximum centring error in any direction
3 mm

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operating of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. During adjustment on the production line max. 1500 V is permitted.
7. For maximum cathode life it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLAT SQUARE Hi-Bri COLOUR PICTURE TUBES

- Flat and square screen
- $90^{\circ}$ deflection
- In-line, hi-bi potential A R T* gun
- 29,1 mm neck diameter
- Mask with corner suspension
- Hi-Bri technology
- Pigmented phosphors
- Quick-heating low-power cathodes
- Soft flash
- Slotted shadow mask optimized for minimum moiré at 625 lines system
- Internal magnetic shield
- Internal multipole
- Reinforced envelope for push-through mounting
- The tube is supplied with a matched hybrid saddle toroidal deflection unit of the AT6035 series; it forms a self-converging and raster correction free assembly

## QUICK REFERENCE DATA

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. $1,3 \mathrm{~mm}$. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $354 \times 449 \mathrm{~mm}$.
6. Not applicable.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. $50 \mathrm{~mm}(1,968 \mathrm{in})$, concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-1II-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

| $V_{a, g 4}$ | 25 kV |
| :--- | ---: |
| $\mathrm{V}_{\mathrm{g} 3}$ | 7,25 to $8,25 \mathrm{kV}$ |
| $\mathrm{V}_{\mathrm{g} 2}$ | see below |
| $\mathrm{V}_{\mathrm{f}}$ | $6,3 \mathrm{~V}$ |

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=130 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 575 to 825 V ;
$\mathrm{V}_{\mathrm{k}}$ range 105 to 130 V .

## Adjustment procedure:

Set the cathode voltage ( $\mathrm{V}_{\mathrm{k}}$ ) for each gun at 130 V ; increase the grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) from approx. 550 V to the value at which one of the colours become just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

## EOUIPMENT DESIGN VALUES

The values are valid for anode voltages between 20 and $27,5 \mathrm{kV}$. The voltages are specified with respect to grid 1.

Grid 3 (focusing electrode) voltage

| $R_{g} 3$ | max. | 70 | $M \Omega$ |
| :--- | :--- | :---: | :---: |
| $R_{g} 1 k$ | max. | 0,75 | $M \Omega$ |

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. During adjustment on the production line max. 1500 V is permitted.
7. For maximum cathode life it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $11,5 \mathrm{kV}$ $\left(1,5 \times V_{g 3}\right.$ max. at $\left.V_{a, g 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\min .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 4 mm

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| Colour co-ordinates: | $x$ | $y$ |
| :---: | :---: | :---: |
| red | 0,635 | 0,340 |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

Cathode heating time after switching on, measured under typical operating conditions.

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil.

For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns* is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns**).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.

Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

Degaussing circuit using dual
PTC thermistor 2322662 98009;
$\mathrm{C}=100 \mathrm{nF}$, for double-coil system, optional for single-coil system.

## Data of degaussing coil

Circumference

| double-coil system | singie-coil system |
| :---: | :---: |
| 125 cm | 139 cm |
| 60 | 140 |
| $0,4 \mathrm{~mm}$ | $0,4 \mathrm{~mm}$ |
| $0,5 \mathrm{~mm}$ | $0,5 \mathrm{~mm}$ |
| $22 \Omega$ (two coils | $27 \Omega$ |
| in series) |  |

* 300 ampere-turns for double-coil system; 700 ampere-turns for single-coil system.
** $\leqslant 0,3$ ampere-turns for double-coil system; $\leqslant 0,6$ ampere-turns for single-coil system.

## FLAT SQUARE Hi-Bri COLOUR PICTURE TUBE

- Flat and square screen
- $90^{\circ}$ deflection
- In-line, hi-bi potential A R T* gun
- 22,5 mm neck diameter
- Shadow mask of NiFe alloy with low thermal expansion
- Hi-Bri technology
- Mask with corner suspension
- Pigmented phosphors
- Fine pitch over entire screen
- Quick-heating low-power cathodes
- Soft flash
- Slotted shadow mask optimized for minimum moiré at 625 lines system
- Internal magnetic shield
- Internal multipole
- Reinforced envelope for push-through mounting
- The tube is supplied with a deflection unit of the AT6040 series; it forms a self-converging and raster correction free assembly

Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different, but will contain the contact areas as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate ( $1,3 \mathrm{~mm}$ max.) from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. corners of a rectangle of $354 \mathrm{~mm} \times 449 \mathrm{~mm}$.
6. Distance from point $Z$ to any hardware.
7. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.
8. Small cavity contact J1-21, IEC 67-III-2.
9. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate at the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

## TYPICAL OPERATING CONDITIONS

The voltages are specified with respect to grid 1.

## Anode voltage

Grid 3 (focusing electrode) voltage
Grid 2 voltage for a spot cut-off voltage $V_{k}=120 \mathrm{~V}$

| $V_{\mathrm{a}, \mathrm{g} 4}$ | 25 kV |
| :--- | ---: |
| $\mathrm{V}_{\mathrm{g} 3}$ | 7,25 to $8,25 \mathrm{kV}$ |
| $\mathrm{V}_{\mathrm{g} 2}$ | 310 to 650 V |

Spot cut-off design chart.
Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 310 to 685 V ;
$V_{k}$ range 100 to 125 V .
Adjustment procedure:
Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 125 V ; increase the grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) from approx. 300 V to the value at which one of the colours become just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

## EQUIPMENT DESIGN VALUES

The values are valid for anode voltages between 20 and $27,5 \mathrm{kV}$. The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. The $X$-ray dose rate remains below the acceptable value of $0,5 \mathrm{mR} / \mathrm{h}$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $12,5 \mathrm{kV}$ $\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## BEAM CORRECTIONS

Maximum centring errc: in any direction after colour purity, static convergence, an:d horizontal centre line correction, measured with deflectiol. coils in nominal position 3 mm

Cathode heating time after switching on, measured under typical operating conditions.

Typical cathode drive characteristics.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=100 \mathrm{~V}$ (curve a), and $\mathrm{V}_{\mathrm{k}}=125 \mathrm{~V}$ (curve b).
For optimum picture performance it is recommended that the cathodes are not driven below +1 V .

Luminance at the centre of the screen as a function of $I_{\text {total }}$.

| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

## DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns* is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns**).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

Degaussing circuit using dual PTC thermistor 2322662 98009; $\mathrm{C}=100 \mathrm{nF}$, for double-coil system, optional for single-coil system.

| Heater voltage | $V_{f}$ |  | $\begin{aligned} & +5 \% \\ & -10 \% \end{aligned}$ | notes 1 and 6 |

## Notes

1. Absolute maximum rating system.
2. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
3. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
4. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
5. During adjustment on the production line max. 1500 V is permitted.
6. For maximum cathode life it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## 2. EQUIPMENT DESIGN RANGES

Unless otherwise specified, values are for each gun and voltage values are positive with respect to grid 1.

For anode voltages between 20 kV and 30 kV :
Grid 3 (focusing electrode) voltage $\quad V_{g 3} \quad 29 \%$ to $33 \%$ of anode voltage
Grid 2 voltage and cathode voltage for visual extinction of undeflected focused spot
$\mathrm{V}_{\mathrm{g} 2}, \mathrm{~V}_{\mathrm{k}}$ see cut-off design chart, page 19 ; note 1
Maximum ratio of cathode voltage highest gun to lowest gun in any tube

| 0,5 | 0,7 | 1,0 | 0,6 | 0,9 | 1,2 |

## Notes

1. The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 130 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 575 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $\mathrm{V}_{\mathrm{k}}$ of the remaining guns so that the rasters of these guns also become visible.
2. For optimum picture performance it is recommended that the cathodes are not driven below +1 V .

## 3. EXAMPLE OF USE OF DESIGN RANGES

Unless otherwise specified, voltage values are for each gun and are positive with respect to grid 1.
Anode voltage
Grid 3 (focusing electrode) voltage

$$
\begin{array}{lr}

## 4. BEAM CORRECTIONS

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position
$4 \mathrm{~mm}(0,16 \mathrm{in})$
5. LIMITING CIRCUIT VALUES

## High voltage circuits

To minimize the possibility of damage to the circuit caused by a momentary internal arc, it is recommended that the high-voltage power supply and the grid 3 power supply be of the limited energy type.
Grid 3 circuit resistance
Grid 1 to cathode circuit resistance (each gun)

| $R_{g} 3$ | max. | $70 \mathrm{M} \Omega$ |
| :--- | :--- | ---: |
| $\mathrm{R}_{\mathrm{g} 1 \mathrm{k}}$ | max. | $0,75 \mathrm{M} \Omega$ |

## Notes

1. The tube has quick-heating cathodes; if standby conditions are still required operate at $5,0 \mathrm{~V}$.
2. Tube settings adjusted to produce white of $9300 \mathrm{~K}+27$ M.P.C.D. $(x=0,281, y=0,311)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.
3, Tube settings adjusted to produce white of 6500K +7 M.P.C.D. $(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

## 6. DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns* is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns**).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

Degaussing circuit using dual
PTC thermistor 2322662 98009; $\mathrm{C}=100 \mathrm{nF}$, for double-coil system, optional for single-coil system.

## Data of degaussing coil

## Circumference

Number of turns

| in series) |  |

* For double-coil system; 700 ampere-turns for single-coil system.
** For double-coil system; $\leqslant 0,6$ ampere-turns for single-coil system.

## 7. FLASHOVER PROTECTION

With the high voltage used with this tube (max. 30 kV ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $13,5 \mathrm{kV}\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=27,5 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## X-RADIATION LIMIT

Maximum anode voltage at which the $X$-radiation emitted will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ at an anode current of $300 \mu \mathrm{~A}$
entire tube $35,5 \mathrm{kV}$ *
face-plate only 37 kV

## Warning:

If the value for the tube face only is used as design criterion, adequate shielding must be provided in the receiver for the anode contact and/or certain portions of the tube funnel and panel skirt to insure that the $X$-radiation from the receiver is attenuated to a value equal to or lower than that specified for the face of the tube.

Maximum voltage difference between anode and focus electrode at which the X -radiation will not exceed 0,5 mR/h

## Warning:

If the voltage value above can be exceeded in the receiver, additional attenuation of the X -radiation through the tube neck may be required.

The $X$-radiation emitted from this picture tube, as measured in accordance with the procedure of JEDEC Publication No. 64D, will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ throughout the useful tube life when operated within the 'Design maximum ratings'.

The tube should not be operated beyond its 'Design maximum ratings' stated above, but its X-radiation will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ for anode voltage and current combinations given by the isoexposure-rate limits characteristics shown on the next page.

Operation above the values shown by the curve may result in failure of the television receiver to comply with the Federal Performance Standard of the U.S. for Television Receivers, Section 1020-10 of Part 1020 of Title 21, Code of Federal Regulation (PL90-602) as published in the Federal Register Volume 38, No. 198, Monday, October 15, 1973.
Maximum X-radiation as a function of anode voltage at $300 \mu \mathrm{~A}$ anode current is shown by the curve on the next page. X-radiation at a constant anode voltage varies linearly with anode current.

[^27]
$0,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curve.

X-radiation limit curve at a constant anode current of $300 \mu \mathrm{~A}$.

## WARNINGS

## X-radiation

Operation of this colour picture tube at abnormal conditions which exceed the $0,5 \mathrm{mR} / \mathrm{h}$ iso-dose rate curve shown on the preceding page may produce soft $X$-rays which may constitute a health hazard on prolonged exposure at close range unless adequate external screening is provided. Precautions must therefore be exercised during servicing of TV receivers employing this tube to assure that the anode voltage and other tube voltages are adjusted to the recommended values so that the 'Design maximum ratings' will not be exceeded.

## Tube replacement

This picture tube employs integral X-radiation and implosion protection and must be replaced with a tube of the same type number or a recommended replacement to assure continued safety.

## Shock hazard

The high voltage at which the tube is operated may be very dangerous. The design of the TV receiver should include safeguards to prevent the userfrom coming in contact with the high voltage. Extreme care should be taken in the servicing or adjustment of any high-voltage circuit.
Caution must be exercised during the replacement or servicing of the picture tube since a residual electrical charge may be contained on the high-voltage capacitor formed by the external and internal conductive coatings of the picture tube funnel. To remove any residual high-voltage charges from the picture tube, 'bleed-off the charge by shorting the anode contact button, located in the funnel of the picture tube, to the external conductive coating before handling the tube. Discharging the high voltage to isolated metal parts such as cabinets and control brackets may produce a shock hazard.

## Tube handling

Picture tubes should be kept in the shipping box or similar protective container until just prior to installation. Wear heavy protective clothing, including gloves and safety goggles with side shields, in areas containing unpacked and unprotected tubes to prevent possible injury from flying glass in the event a tube breaks. Handle the picture tube with extreme care. Do not strike, scratch or subject the tube to more than moderate pressure. Particular care should be taken to prevent damage to the seal area.

The receiver mounting system should incorporate sufficient cushioning so that under normal conditions of shipment or handling an impact acceleration of more than 35 g is never applied to the tube.

## MECHANICAL DATA

The dimensions are given in mm, and in inches between brackets.
Notes are on page 15.

MECHANICAL DATA (continued)

i.c. $=$ internally connected (not to be used)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. $1,3 \mathrm{~mm}$ $(0,05 \mathrm{in})$. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}(0,07 \mathrm{in})$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $354 \mathrm{~mm}(13,94 \mathrm{in}) \times$ 449 mm (17,68 in).
6. Not applicable.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. $50 \mathrm{~mm}(1,968 \mathrm{in})$, concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-1II-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate $3,2 \mathrm{~mm}$ ( $0,13 \mathrm{in}$ ) beyond the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

Sagittal heights with reference to screen centre at the edge of the minimum useful screen

$$

Connection diagram and top view of terminals of deflection unit AT6030, type 1. The beginning of the windings is indicated with $\bullet$.

## FLAT SQUARE HIBRICON COLOUR PICTURE TUBES

- Flat and square screen
- $90^{\circ}$ deflection
- In-line, hi-bi potential A R T* gun
- 29,1 mm neck diameter
- Mask with corner suspension
- Hibricon screen with pigmented phosphors featuring high brightness and increased contrast performance
- Quick-heating low-power cathodes
- Soft flash
- Slotted shadow mask optimized for minimum moiré at 525 lines system
- Internal magnetic shield
- Internal multipole
- Reinforced envelope for push-through mounting
- The tube is supplied with a matched hybrid saddle toroidal deflection unit of the AT6030 series; it forms a self-converging and raster correction free assembly

## QUICK REFERENCE DATA

| Deflection angle | $90^{\circ}$ |
| :--- | :--- |
| Minimum useful screen diagonal | 51 cm |
| Overall length | 444 mm |
| Neck diameter | $29,1 \mathrm{~mm}$ |
| Heating | $6,3 \mathrm{~V}, 310 \mathrm{~mA}$ |
| Focusing voltage | $31 \%$ of anode voltage |

Types A51EBS00X and A51EBS10X are identical, except for the light transmission of the face glass at centre: $64,5 \%$ for A51EBS00X, and 52,3\% for A51EBS10X.

| Heater voltage | $V_{f}$ |  | $\begin{gathered} +5 \% \\ -10 \% \end{gathered}$ | notes 1 and 6 |

## Notes

1. Absolute maximum rating system.
2. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
3. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
4. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
5. During adjustment on the production line max. 1500 V is permitted.
6. For maximum cathode life it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## 2. EQUIPMENT DESIGN RANGES

Unless otherwise specified, values are for each gun and voltage values are positive with respect to grid 1.

For anode voltages between 20 kV and 30 kV :
Grid 3 (focusing electrode) voltage
Grid 2 voltage and cathode voltage for visual
extinction of undeflected focused spot
Maximum ratio of cathode voltage
highest gun to lowest gun in any tube
Video drive characteristics
Grid 3 current
Grid 2 current
Grid 1 current, under cut-off condition
To produce white of the following

## Notes

1. The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 130 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 575 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $\mathrm{V}_{\mathrm{k}}$ of the remaining guns so that the rasters of these guns also become visible.
2. For optimum picture performance it is recommended that the cathodes are not driven below +1 V .
3. EXAMPLE OF USE OF DESIGN RANGES

Unless otherwise specified, voltage values are for each gun and are positive with respect to grid 1.

4. BEAM CORRECTIONS

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position 4 mm ( $0,16 \mathrm{in}$ )
5. LIMITING CIRCUIT VALUES

## High voltage circuits

To minimize the possibility of damage to the circuit caused by a momentary internal arc, it is recommended that the high-voltage power supply and the grid 3 power supply be of the limited energy type.

| Grid 3 circuit resistance | $R_{\mathrm{g} 3}$ | $\max$ | $70 \mathrm{M} \Omega$ |
| :--- | :--- | :--- | ---: | ---: |
| Grid 1 to cathode circuit resistance (each gun) | $\mathrm{R}_{\mathrm{g} 1 \mathrm{k}}$ | $\max$. | $0,75 \mathrm{M} \Omega$ |

## Notes

1. The tube has quick-heating cathodes; if standby conditions are still required operate at $5,0 \mathrm{~V}$.
2. Tube settings adjusted to produce white of $9300 \mathrm{~K}+27$ M.P.C.D. $(x=0,281, y=0,311)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.
3. Tube settings adjusted to produce white of $6500 \mathrm{~K}+7$ M.P.C.D. $(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

## 6. DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns* is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns**).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.

Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

Degaussing circuit using dual PTC thermistor 2322662 98009; C $=100 \mathrm{nF}$, for double-coil system, optional for single-coil system.

## Data of degaussing coil

Circumference
Number of turns
Copper-wire diameter
Aluminium-wire diameter
Resistance

7 Z95546

|  | double-coil system | single-coil system |
| :--- | :---: | :--- |
|  | $125 \mathrm{~cm}(49 \mathrm{in})$ | $139 \mathrm{~cm}(54 \mathrm{in})$ |
| Circumference | 60 | 140 |
| Number of turns | $0,4 \mathrm{~mm}(0,016 \mathrm{in})$ | $0,4 \mathrm{~mm}(0,016 \mathrm{in})$ |
| Copper-wire diameter | $0,5 \mathrm{~mm}(0,02 \mathrm{in})$ | $0,5 \mathrm{~mm}(0,02 \mathrm{in})$ |
| Aluminium-wire diameter | $22 \Omega$ (two coils | $27 \Omega$ |
| Resistance | in series) |  |

* For double-coil system; 700 ampere-turns for single-coil system.
** For double-coil system; $\leqslant 0,6$ ampere-turns for single-coil system.

## 7. FLASHOVER PROTECTION

With the high voltage used with this tube (max. 30 kV ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode ( g 3 ) of $13,5 \mathrm{kV}\left(1,5 \times \mathrm{V}_{\mathrm{g}}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=27,5 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## X-RADIATION LIMIT

Maximum anode voltage at which the $X$-radiation emitted will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ at an anode current of $300 \mu \mathrm{~A}$
entire tube $\quad 35,5 \mathrm{kV}$ *
face-plate only 37 kV

## Warning:

If the value for the tube face only is used as design criterion, adequate shielding must be provided in the receiver for the anode contact and/or certain portions of the tube funnel and panel skirt to insure that the X -radiation from the receiver is attenuated to a value equal to or lower than that specified for the face of the tube.

Maximum voltage difference between anode and focus electrode at which the X -radiation will not exceed $0,5 \mathrm{mR} / \mathrm{h}$

## Warning:

If the voltage value above can be exceeded in the receiver, additional attenuation of the X -radiation through the tube neck may be required.
The X -radiation emitted from this picture tube, as measured in accordance with the procedure of JEDEC Publication No. 64D, will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ throughout the useful tube life when operated within the 'Design maximum ratings'.

The tube should not be operated beyond its 'Design maximum ratings' stated above, but its X-radiation will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ for anode voltage and current combinations given by the isoexposure-rate limits characteristics shown on the next page.
Operation above the values shown by the curve may result in failure of the television receiver to comply with the Federal Performance Standard of the U.S. for Television Receivers, Section 1020-10 of Part 1020 of Title 21, Code of Federal Regulation (PL90-602) as published in the Federal Register Volume 38, No. 198, Monday, October 15, 1973.

Maximum X-radiation as a function of anode voltage at $300 \mu \mathrm{~A}$ anode current is shown by the curve on the next page. X-radiation at a constant anode voltage varies linearly with anode current.

[^30]
$0,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curve.

X-radiation limit curve at a constant anode current of $300 \mu \mathrm{~A}$.

## WARNINGS

## X-radiation

Operation of this colour picture tube at abnormal conditions which exceed the $0,5 \mathrm{mR} / \mathrm{h}$ iso-dose rate curve shown on the preceding page may produce soft X -rays which may constitute a health hazard on prolonged exposure at close range unless adequate external screening is provided. Precautions must therefore be exercised during servicing of TV receivers employing this tube to assure that the anode voltage and other tube voltages are adjusted to the recommended values so that the 'Design maximum ratings' will not be exceeded.

## Tube replacement

This picture tube employs integral X-radiation and implosion protection and must be replaced with a tube of the same type number or a recommended replacement to assure continued safety.

## Shock hazard

The high voltage at which the tube is operated may be very dangerous. The design of the TV receiver should include safeguards to prevent the userfrom coming in contact with the high voltage. Extreme care should be taken in the servicing or adjustment of any high-voltage circuit.

Caution must be exercised during the replacement or servicing of the picture tube since a residual electrical charge may be contained on the high-voltage capacitor formed by the external and internal conductive coatings of the picture tube funnel. To remove any residual high-voltage charges from the picture tube, 'bleed-off the charge by shorting the anode contact button, located in the funnel of the picture tube, to the external conductive coating before handling the tube. Discharging the high voltage to isolated metal parts such as cabinets and control brackets may produce a shock hazard.

## Tube handling

Picture tubes should be kept in the shipping box or similar protective container until just prior to installation. Wear heavy protective clothing, including gloves and safety goggles with side shields, in areas containing unpacked and unprotected tubes to prevent possible injury from flying glass in the event a tube breaks. Handle the picture tube with extreme care. Do not strike, scratch or subject the tube to more than moderate pressure. Particular care should be taken to prevent damage to the seal area.
The receiver mounting system should incorporate sufficient cushioning so that under normal conditions of shipment or handling an impact acceleration of more than 35 g is never applied to the tube.

## MECHANICAL DATA

The dimensions are given in mm , and in inches between brackets.
Notes are on page 15.

Flat square Hibricon colour picture tubes

## MECHANICAL DATA (continued)

i.c. $=$ internally connected (not to be used)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. $1,3 \mathrm{~mm}$ ( $0,05 \mathrm{in}$ ). This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}(0,07 \mathrm{in})$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $354 \mathrm{~mm}(13,94 \mathrm{in}) \times$ 449 mm (17,68 in).
6. Not applicable.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. $50 \mathrm{~mm}(1,968 \mathrm{in})$, concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate $3,2 \mathrm{~mm}$ ( $0,13 \mathrm{in}$ ) beyond the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

## FLAT SQUARE HIBRICON COLOUR PICTURE TUBES

- Flat and square screen
- $90^{\circ}$ deflection
- In-line, hi-bi potential A R T* gun
- 29,1 mm neck diameter
- Mask with corner suspension
- Hibricon screen with pigmented phosphors featuring high brightness and increased contrast performance
- Quick-heating low-power cathodes
- Soft flash
- Slotted shadow mask optimized for minimum moiré at 525 lines system
- Internal magnetic shield
- Internal multipole
- Reinforced envelope for push-through mounting
- The tube is supplied with a matched hybrid saddle toroidal deflection unit of the AT6030 series; it forms a self-converging and raster correction free assembly

## RATINGS AND ELECTRICAL DATA

1. LIMITING VALUES (Design maximum rating system unless otherwise stated)

Unless otherwise specified, voltage values are for each gun and values are positive with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
3. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
4. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
5. During adjustment on the production line max. 1500 V is permitted.
6. For maximum cathode life it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## 2. EQUIPMENT DESIGN RANGES

Unless otherwise specified, values are for each gun and voltage values are positive with respect to grid 1.
For anode voltages between 20 kV and 30 kV :
Grid 3 (focusing electrode) voltage
Grid 2 voltage and cathode voltage for visual extinction of undeflected focused spot

| red | green | blue | red | green | blue |
| 38,3 | 35,8 | 25,9\% | 27,9 | 39,1 | 33,0\% |
| min. | typ. | max. | min. | typ. | max. |
| 1,1 | 1,5 | 1,9 | 0,6 | 0,9 | 1,2 |
| 0,8 | 1,1 | 1,4 | 0,5 | 0,7 | 1,0 |
| 0,5 | 0,7 | 1,0 | 0,6 | 0,9 | 1,2 |

## Notes

1. The common $\mathrm{V}_{\mathrm{g} 2}$ should be adjusted as follows:

Set the cathode voltage, $\mathrm{V}_{\mathrm{k}}$, for each gun at 130 V . Increase the $\mathrm{V}_{\mathrm{g} 2}$ from about 575 V to the value at which the raster of one of the guns becomes just visible. Now decrease the $V_{k}$ of the remaining guns so that the rasters of these guns also become visible.
2. For optimum picture performance it is recommended that the cathodes are not driven below +1 V .
3. EXAMPLE OF USE OF DESIGN RANGES

Unless otherwise specified, voltage values are for each gun and are positive with respect to grid 1.
Anode voltage
Grid 3 (focusing electrode) voltage

| $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}$ | $27,5 \mathrm{kV}$ |
| :--- | ---: |
| $\mathrm{V}_{\mathrm{g} 3}$ | 8,0 to $9,1 \mathrm{kV}$ |

Grid 2 voltage when circuit design utilizes cathode voltage of 130 V for visual extinction of focused spot
Heater voltage, under operating conditions

## 4. BEAM CORRECTIONS

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction, measured with deflection coils in nominal position
5. LIMITING CIRCUIT VALUES

## High voltage circuits

To minimize the possibility of damage to the circuit caused by a momentary internal arc, it is recommended that the high-voltage power supply and the grid 3 power supply be of the limited energy type.
Grid 3 circuit resistance
Grid 1 to cathode circuit resistance (each gun)

| $R_{g} 3$ | max. | $70 \mathrm{M} \Omega$ |
| :--- | :--- | ---: |
| $\mathrm{R}_{\mathrm{g} 1 \mathrm{k}}$ | $\max$. | $0,75 \mathrm{M} \Omega$ |

## Notes

1. The tube has quick-heating cathodes; if standby conditions are still required operate at $5,0 \mathrm{~V}$.
2. Tube settings adjusted to produce white of $9300 \mathrm{~K}+27$ M.P.C.D. $(x=0,281, y=0,311)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.
3. Tube settings adjusted to produce white of $6500 \mathrm{~K}+7$ M.P.C.D. $(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

## 6. DEGAUSSING

The picture tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns* is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate degaussing circuitry. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns**).
If single-phase power rectification is employed in the t.v. circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
Examples of a double-coil and of a single-coil system are given below.

Position of degaussing coils on the picture tube.

Degaussing circuit using dual
PTC thermistor 2322662 98009;
$\mathrm{C}=100 \mathrm{nF}$, for double-coil system, optional for single-coil system.

7295546

## Data of degaussing coil

|  | double-coil system | single-coil system |
| :--- | :---: | :--- |
|  | $125 \mathrm{~cm}(49 \mathrm{in})$ | $139 \mathrm{~cm}(54 \mathrm{in})$ |
| Cumber of turns | 60 | 140 |
| Copper-wire diameter | $0,4 \mathrm{~mm}(0,016 \mathrm{in})$ | $0,4 \mathrm{~mm}(0,016 \mathrm{in})$ |
| Aluminium-wire diameter | $0,5 \mathrm{~mm}(0,02 \mathrm{in})$ | $0,5 \mathrm{~mm}(0,02 \mathrm{in})$ |
| Resistance | $22 \Omega$ (two coils | $27 \Omega$ |
|  | in series) |  |

* For double-coil system; 700 ampere-turns for single-coil system.
** For double-coil system; $\leqslant 0,6$ ampere-turns for single-coil system.

## 7. FLASHOVER PROTECTION

With the high voltage used with this tube (max. 30 kV ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $13,5 \mathrm{kV}\left(1,5 \times \mathrm{V}_{\mathrm{g} 3}\right.$ max. at $\left.\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}=27,5 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

## X-RADIATION LIMIT

Maximum anode voltage at which the X -radiation emitted will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ at an anode current of $300 \mu \mathrm{~A}$

#### Abstract

entire tube

## Warning:

If the value for the tube face only is used as design criterion, adequate shielding must be provided in the receiver for the anode contact and/or certain portions of the tube funnel and panel skirt to insure that the X -radiation from the receiver is attenuated to a value equal to or lower than that specified for the face of the tube.

Maximum voltage difference between anode and focus electrode at which the X -radiation will not exceed $0,5 \mathrm{mR} / \mathrm{h}$

## Warning:

If the voltage value above can be exceeded in the receiver, additional attenuation of the X -radiation through the tube neck may be required.

The X-radiation emitted from this picture tube, as measured in accordance with the procedure of JEDEC Publication No. 64D, will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ throughout the useful tube life when operated within the 'Design maximum ratings'.
The tube should not be operated beyond its 'Design maximum ratings' stated above, but its X-radiation will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ for anode voltage and current combinations given by the isoexposure-rate limits characteristics shown on the next page.
Operation above the values shown by the curve may result in failure of the television receiver to comply with the Federal Performance Standard of the U.S. for Television Receivers, Section 1020-10 of Part 1020 of Title 21, Code of Federal Regulation (PL90-602) as published in the Federal Register Volume 38, No. 198, Monday, October 15, 1973.

Maximum X-radiation as a function of anode voltage at $300 \mu \mathrm{~A}$ anode current is shown by the curve on the next page. X-radiation at a constant anode voltage varies linearly with anode current.

[^33]
$0,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curve.

X-radiation limit curve at a constant anode current of $300 \mu \mathrm{~A}$.

## WARNINGS

## X-radiation

Operation of this colour picture tube at abnormal conditions which exceed the $0,5 \mathrm{mR} / \mathrm{h}$ iso-dose rate curve shown on the preceding page may produce soft X -rays which may constitute a health hazard on prolonged exposure at close range unless adequate external screening is provided. Precautions must therefore be exercised during servicing of TV receivers employing this tube to assure that the anode voltage and other tube voltages are adjusted to the recommended values so that the 'Design maximum ratings' will not be exceeded.

## Tube replacement

This picture tube employs integral X-radiation and implosion protection and must be replaced with a tube of the same type number or a recommended replacement to assure continued safety.

## Shock hazard

The high voltage at which the tube is operated may be very dangerous. The design of the TV receiver should include safeguards to prevent the user from coming in contact with the high voltage. Extreme care should be taken in the servicing or adjustment of any high-voltage circuit.
Caution must be exercised during the replacement or servicing of the picture tube since a residual electrical charge may be contained on the high-voltage capacitor formed by the external and internal conductive coatings of the picture tube funnel. To remove any residual high-voltage charges from the picture tube, 'bleed-off the charge by shorting the anode contact button, located in the funnel of the picture tube, to the external conductive coating before handling the tube. Discharging the high voltage to isolated metal parts such as cabinets and control brackets may produce a shock hazard.

## Tube handling

Picture tubes should be kept in the shipping box or similar protective container until just prior to installation. Wear heavy protective clothing, including gloves and safety goggles with side shields, in areas containing unpacked and unprotected tubes to prevent possible injury from flying glass in the event a tube breaks. Handle the picture tube with extreme care. Do not strike, scratch or subject the tube to more than moderate pressure. Particular care should be taken to prevent damage to the seal area.
The receiver mounting system should incorporate sufficient cushioning so that under normal conditions of shipment or handling an impact acceleration of more than 35 g is never applied to the tube.

## MECHANICAL DATA

The dimensions are given in mm , and in inches between brackets.
Notes are on page 15.

## MECHANICAL DATA (continued)

i.c. $=$ internally connected (not to be used)

## Notes to outline drawings on the preceding pages

1. Configuration of outer conductive coating may be different but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. The displacement of any lug with respect to the plane through the three other lugs is max. $1,3 \mathrm{~mm}$ $(0,05 \mathrm{in})$. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}(0,07 \mathrm{in})$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of 354 mm ( $13,94 \mathrm{in}$ ) x $449 \mathrm{~mm}(17,68 \mathrm{in})$.
6. Not applicable.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. $50 \mathrm{~mm}(1,968 \mathrm{in})$, concentric with an imaginary tube axis.
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate $3,2 \mathrm{~mm}$ ( $0,13 \mathrm{in}$ ) beyond the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

## 30AX COLOUR PICTURE TUBE

- Automatic snap-in raster orientation
- Push-on axial purity positioning
- Internal magneto-static beam alignment
- Hi-Bi gun with quadrupole cathode lens
- Self-aligning, self-converging assembly with low power consumption, when combined with deflection unit AT 1860
- North-south pin-cushion distortion-free
- $110^{\circ}$ deflection
- Hi-Bri screen
- Pigmented phosphors: enhanced contrast
- Phosphor lines follow glass contour
- In-line gun
- Standard $36,5 \mathrm{~mm}$ neck
- Soft-Flash technology
- Slotted shadow mask optimized for minimum moiré
- Fine pitch over entire screen
- Quick-heating cathodes
- Internal magnetic shield
- Anti-crackle coating
- Reinforced envelope for push-through mounting

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than $350 \mathrm{~m} / \mathrm{s}^{2}$ in any direction.

* Tube settings adjusted to produce white $D(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

MECHANICAL DATA (continued)
Notes are given after the drawings.

## MECHANICAL DATA (continued)

Notes to outline drawings on the preceding pages

1. This ridge can be used as an orientation for the deflection unit.
2. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
3. To clean this area wipe only with a soft lintless cloth.
4. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm .
5. Minimum space to be reserved for mounting lug.
6. The position of the mounting screw in the cabinet must be within a circle of $9,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $476,5 \mathrm{~mm} \times 370 \mathrm{~mm}$.
7. Co-ordinates for radius $R=14,8 \mathrm{~mm}: x=203,9 \mathrm{~mm}, y=145,5 \mathrm{~mm}$.
8. Distance from point $z$ to any hardware.
9. Maximum dimensions in plane of lugs.
10. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. Bottom circumference of the base will fall within a circle concentric with the tube axis and having a diameter of 55 mm .
The mass of the mating socket with circuitry should not be more than 150 g ; maximum permissible torque is 40 mNm .
11. Minimum distance between glass and rimband in plane of centre line of the apertures.
12. Centring bosses for deflection unit.

## RECOMMENDED OPERATING CONDITIONS (cathode drive)

The voltages are specified with respect to grid 1.
Anode voltage
Grid 3 (focusing electrode) voltage

$$
\begin{array}{ll}
V_{a, g} 5, \mathrm{~g} 4 & 25 \mathrm{kV} \\
\mathrm{~V}_{\mathrm{g} 3} & 6,5 \text { to } 7,45 \mathrm{kV}
\end{array}
$$

## A. Operation at equal spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$

Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for each gun separately; $\mathrm{V}_{\mathrm{g} 2}$ range 590 to 800 V .

Spot cut-off design chart.

Typical cathode drive characteristic.
$\mathrm{V}_{\mathrm{f}}=6,3 \mathrm{~V}$;
$V_{a, g 5, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$.

## B. Operation at equal grid 2 voltage

Grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=150 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage.
$\mathrm{V}_{\mathrm{g} 2}$ range 630 to 860 V .
$V_{k}$ range 120 to 150 V .
Adjustment procedure:
Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 150 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 600 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

Spot cut-off design chart.

Typical cathode drive characteristic.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 5, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for forus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=120 \mathrm{~V}$ and 150 V .

EQUIPMENT DESIGN VALUES (each gun if applicable)
The values are valid for anode voltages between 22,5 and $27,5 \mathrm{kV}$.
The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. During adjustment on the production line max. 1500 V is permitted.
7. For maximum cathode life and optimum performance it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

High electric field strengths are present between the gun electrodes of picture tubes. Voltages between gun electrodes may reach values of 20 kV over approx. 1 mm . As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage and damage to the circuitry which is directly connected to the tube socket. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $10,5 \mathrm{kV}$, and at the other electrodes of 1,5 to 2 kV . The values of the series isolation resistors should be as high as possible ( $\min .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

Luminance at the centre of the screen as a function of $I_{\text {total }}$. Scanned area $444,2 \mathrm{~mm} \times 334,2 \mathrm{~mm}$.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| red | 0,315 | 0,600 |
| green | 0,150 | 0,060 |

Cathode heating time to attain a certain percentage of the cathode current at equilibrium conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts.
For proper degaussing an initial magnetomotive force (m.m.f.) of 250 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate circuitry. To prevent beam landing disturbances by line-frequency currents induced in the degaussing coils, these coils should be shunted by a capacitor of sufficiently high value. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,25$ ampere-turns).
If single-phase power rectification is employed in the TV circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
To ease the mounting of the coils, the rimband is provided with rectangular holes. An example is given below.

Position of degaussing coils on the picture tube.

| Resistance of field coils <br> (potentiometer R1 included) | $5,9 \Omega$ |

## APPLICATION

This deflection unit is for use with $110^{\circ}$ in-line colour picture tube A56-540X, in conjunction with e.g.: diode-split line output transformer AT2076/70A and linearity control unit AT4042/42 or AT4042/30.

## DESCRIPTION

The deflection unit consists of flangeless line and field deflection coils, a one piece ferrite ring and a one piece coil carrier.
Connection to the deflection coils can be made via a connector (contact pins 1 to 4) or solder tags 1 a to 4 a , see Fig. 1 .

Fig. 1 Maximum dimensions.

Fig. 1b. Front view.

The deflection unit fits a tube with a neck diameter of $36,5_{-0}^{+1,3} \mathrm{~mm}$.
Maximum operating temperature (average copper temperature measured with resistance method)

Storage temperature range
Flame retardent
$+90^{\circ} \mathrm{C}$
-20 to $+90^{\circ} \mathrm{C}$
according to UL1413, category 94, V-1

## Mounting

The deflection unit can simply be pushed on the neck of a picture tube.
Both on the neck of the tube and on the deflection unit, there are 3 reference surfaces to establish angular and axial positioning.

Once the unit is mounted the combination is perfectly aligned and requires no further adjustment for static convergence, colour purity and raster orientation.

The unit must be pressed against the reference surfaces on the cone of the picture tube with a force of $20 \pm 5 \mathrm{~N}$ and fixed by tightening teh screw in the clamping ring at the rear with a torque of $1,0_{-0,2}^{+0,4} \mathrm{Nm}$.
Maximum axial force exerted on the screw is 20 N .

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

* Tube setting adjusted to produce white $D(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

MECHANICAL DATA (continued)

## Notes to outline drawings on the preceding pages

1. The displacement of any lug with respect to the plane through the three other lugs is max. $1,5 \mathrm{~mm}$.
2. Minimum space to be reserved for mounting lug.
3. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $524 \mathrm{~mm} \times 406,5 \mathrm{~mm}$.
4. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.

## TYPICAL OPERATING CONDITIONS

The voltages are specified with respect to grid 1.
Anode voltage
$V_{a, 94}$
25 kV
Grid 3 (focusing electrode) voltage
Grid 2 voltage for a spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=130 \mathrm{~V}$
Heater voltage under operating conditions
$V_{\mathrm{g} 3}$
7,25 to $8,25 \mathrm{kV}$
$\mathrm{V}_{\mathrm{g} 2}$ see below
$V_{f}$

Spot cut-off design chart.
Grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=130 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$\mathrm{V}_{\mathrm{g} 2}$ range 575 to 825 V ;
$\mathrm{V}_{\mathrm{k}}$ range 105 to 130 V .
Adjustment procedure:
Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 130 V ; increase the grid 2 voltage $\left(\mathrm{V}_{\mathrm{g} 2}\right)$ from approx. 550 V to the value at which one of the colours become just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

## EQUIPMENT DESIGN VALUES

The values are valid for anode voltages between 20 and $27,5 \mathrm{kV}$.
The voltages are specified with respect to grid 1.

## Notes

1. Absolute maximum rating system
2. The X-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation withoutput picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. During adjustment on the production line max. 1500 V is permitted.
7. For maximum cathode life it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or one large coil.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate circuitry. To prevent beam landing disturbances by line-frequency currents induced in the degaussing coils, these coils should be shunted by a capacitor of sufficiently high value. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,15$ ampere-turns).
If single-phase power rectification is employed in the TV circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
To ease the mounting of the coils, the rimband is provided with rectangular holes.

length of degaussing coil : 1,35m
Double-coil system.

length of degaussing coil : $2,77 \mathrm{~m}$

Single-coil system.

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than $350 \mathrm{~m} / \mathrm{s}^{2}$ in any direction.

* Tube settings adjusted to produce white $D(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

MECHANICAL DATA (continued)
Notes are given after the drawings.

MECHANICAL DATA (continued)

## Notes to outline drawings on the preceding pages

1. This ridge can be used as an orientation for the deflection unit.
2. Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
3. To clean this area, wipe only with a soft lintless cloth.
4. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm .
5. Minimum space to be reserved for mounting lug.
6. The position of the mounting screw in the cabinet must be within a circle of $9,5 \mathrm{~mm}$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $549 \mathrm{~mm} \times 422 \mathrm{~mm}$.
7. Co-ordinates for radius $R=18,2 \mathrm{~mm}: x=236,6 \mathrm{~mm}, \mathrm{y}=168,9 \mathrm{~mm}$.
8. Distance from point $z$ to any hardware.
9. Maximum dimensions in plane of lugs.
10. The socket for this base should not be rigidly mounted; it should have flexible leads and be aliowed to move freely. Bottom circumference of the base will fall within a circle concentric with the tube axis and having a diameter of 55 mm .
The mass of the mating sock et with circuitry should not be more than 150 g ; maximum permissible torque is 40 mNm .
11. Minimum distance between glass and rimband in plane of the apertures.
12. Centring bosses for deflection unit.

## RECOMMENDED OPERATING CONDITIONS (cathode drive)

The voltages are specified with respect to grid 1.

Anode voltage
Grid 3 (focusing electrode) voltage

$$
\begin{array}{ll}
\mathrm{V}_{\mathrm{a}, \mathrm{~g} 5, \mathrm{~g} 4} & 25 \mathrm{kV} \\
\mathrm{~V}_{\mathrm{g} 3} & 6,5 \text { to } 7,45 \mathrm{kV}
\end{array}
$$

## A. Operation at equal spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$

Grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) adjusted for each gun separately; $\mathrm{V}_{\mathrm{g} 2}$ range 590 to 800 V .

Spot cut-off design chart.

Typical cathode drive characteristic.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g}, g 4=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$.

## B. Operation at equal grid 2 voltage

Grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=150 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage.
$\mathrm{V}_{\mathrm{g} 2}$ range 630 to 860 V .
$\mathrm{V}_{\mathrm{k}}$ range 120 to 150 V .

## Adjustment procedure:

Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 150 V ; increase the grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) from approx. 600 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

Spot cut-off design chart.

Typical cathode drive characteristic.
$V_{f}=6,3 \mathrm{~V}$;
$V_{a, g 5, g 4}=25 \mathrm{kV}$;
$\mathrm{V}_{\mathrm{g} 3}$ adjusted for focus;
$\mathrm{V}_{\mathrm{g} 2}$ (each gun) adjusted to provide spot cut-off for $\mathrm{V}_{\mathrm{k}}=120 \mathrm{~V}$ and 150 V .

## EQUIPMENT DESIGN VALUES (each gun if applicable)

The values are valid for anode voltages between 22,5 and $27,5 \mathrm{kV}$.
The voltages are specified with respect to grid 1.
Grid 3 (focusing electrode) voltage

Difference in cut-off voltage between guns in one tube

Heater voltage
Grid 3 (focusing electrode) current
Grid 2 current
Grid 1 current at $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$
$V_{g 3} 26$ to $29,8 \%$ of anode voltage

To produce white $D$, CIE co-ordinates $x=0,313, y=0,329$.
Percentage of the total anode current supplied by each gun (typ.) red gun

38,3\%
green gun
35,8\%
blue gun
Ratio of anode current
red gun to green gun
red gun to blue gun
blue gun to green gun
25,9\%

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. During adjustment on the production line max. 1500 V is permitted.
7. For maximum cathode life and optimum performance it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

## FLASHOVER PROTECTION

High electric field strengths are present between the gun electrodes of picture tubes. Voltages between gun electrodes may reach values of 20 kV over approx. 1 mm . As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage and damage to the circuitry which is directly connected to the tube socket. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of $10,5 \mathrm{kV}$, and at the other electrodes of 1,5 to 2 kV . The values of the series isolation resistors should be as high as possible ( $\mathrm{min} 1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing.
Additional information is available on request.

7277407

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus.

| Colour co-ordinates: | $\frac{x}{y}$ | $\frac{y}{0,340}$ |
| :--- | :---: | :---: |
| red | 0,635 | 0,30 |
| green | 0,315 | 0,600 |
| blue | 0,150 | 0,060 |

Cathode heating time to attain a certain percentage of the cathode current at equilibrium conditions.

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts.
For proper degaussing an intial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate circuitry. To prevent beam landing disturbances by line-frequency currents induced in the degaussing coils, these coils should be shunted by a capacitor of sufficiently high value. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,3$ ampere-turns).
If single-phase power rectification is employed in the TV circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
To ease the mounting of the coils, the rimband is provided with rectangular holes. An example is given below.

Position of degaussing coils on the picture tube.

Degaussing circuit using dual PTC thermistor 232266298009.

## Data of each degaussing coil

| Circumference | 135 cm |

## APPLICATION

This deflection unit is for use with $110^{\circ}$ in-line colour picture tube A66-540X, in conjunction with e.g.: diode-split line output transformer AT2076/70A and linearity control unit AT4042/42 or AT4042/30.

## DESCRIPTION

The deflection unit consists of flangeless line and field deflection coils, a one piece ferrite ring and a one piece coil carrier.

Connection to the deflection coils can be made via a connector (contact pins 1 to 4 ) or solder tags 1 a to $4 a$, see Fig. 1.

AT1870

Fig. 1 Maximum dimensions.

The deflection unit fits a tube with a neck diameter of $36,5_{-0}^{+1,3} \mathrm{~mm}$.
Maximum operating temperature (average copper temperature measured with resistance method)
Storage temperature range
Flame retardent
$+90^{\circ} \mathrm{C}$
-20 to $+90^{\circ} \mathrm{C}$
according to UL1413, category 94, V-1

## Mounting

The deflection unit can simply be pushed on the neck of a picture tube.
Both on the neck of the tube and on the deflection unit, there are 3 reference surfaces to establish angular and axial positioning.
Once the unit is mounted the combination is perfectly aligned and requires no further adjustment for static convergence, colour purity and raster orientation.
The unit must be pressed against the reference surfaces on the cone of the picture tube with a force of $20 \pm 5 \mathrm{~N}$ and fixed by tightening the screw in the clamping ring at the rear with a torque of $1,0_{-0,2}^{+0,4} \mathrm{Nm}$.
Maximum axial force exerted on the screw is 20 N .

## Handling

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

* Tube settings adjusted to produce white $D(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

MECHANICAL DATA (continued)
Notes are given

Flat square Hi -Bri colour picture tube

Notes to outline drawings on the preceding pages

1. The displacement of any lug with respect to the plane through the three other lugs is max. $1,5 \mathrm{~mm}$.
2. Minimum space to be reserved for mounting lug.
3. The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $581,5 \mathrm{~mm} \times 450 \mathrm{~mm}$.
4. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. 50 mm , concentric with an imaginary tube axis.

## TYPICAL OPERATING CONDITIONS

The voltages are specified with respect to grid 1.

| Anode voltage | $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}$ | 25 kV |
| :--- | :--- | ---: |
| Grid 3 (focusing electrode) voltage | $\mathrm{V}_{\mathrm{g} 3}$ | 7,25 to $8,25 \mathrm{kV}$ |
| Grid 2 voltage for a spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=130 \mathrm{~V}$ | $\mathrm{~V}_{\mathrm{g} 2}$ | see below |
| Heater voltage under operating conditions | $\mathrm{V}_{\mathrm{f}}$ | $6,3 \mathrm{~V}$ |

Spot cut-off design chart.
Grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=130 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage
$V_{g 2}$ range 575 to 825 V ;
$\mathrm{V}_{\mathrm{k}}$ range 105 to 130 V .
Adjustment procedure:
Set the cathode voltage $\left(\mathrm{V}_{\mathrm{k}}\right)$ for each gun at 130 V ; increase the grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) from approx. 550 V to the value at which one of the colours become just visible. Now decrease the cathode voltage of the remaning guns so that the other colours also become visible.

## Notes

1. Absolute maximum rating system.
2. The X-ray dose rate remains below the acceptable value of $36 \mathrm{pA} / \mathrm{kg}(0,5 \mathrm{mR} / \mathrm{h})$, measured with ionization chamber when the tube is used within its limiting values.
3. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
4. Operation of the tube at lower voltages impairs the luminance and resolution, and could impair convergence.
5. The short-term average anode current should be limited by circuitry to $1500 \mu \mathrm{~A}$.
6. During adjustment on the production line max. 1500 V is permitted.
7. For maximum cathode life it is recommended that the heater supply be designed for $6,3 \mathrm{~V}$ at zero beam current.

Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,313, y=0,329$. Exact shape of the peaks depends on the resolution of the measuring apparatus. Colour co-ordinates:
red
green
blue

| $\frac{x}{0,635}$ | $\frac{y}{0,340}$ |
| :---: | :---: |
| 0,315 | 0,600 |
| 0,150 | 0,060 |

## DEGAUSSING

The picture tube is provided with an internal magnetic shield. This shield and the shadow mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts, or on large coil.
For proper degaussing an initial magnetomotive force (m.m.f.) of 300 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate circuitry. To prevent beam landing disturbances by line-frequency currents induced in the degaussing coils, these coils should be shunted by a capacitor of sufficiently high value. In the steady state, no significant m.m.f. should remain in the coils ( $\leqslant 0,15$ ampere-turns).
If single-phase power rectification is employed in the TV circuitry, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
To ease the mounting of the coils, the rimband is provided with rectangular holes.

length of degaussing coil : $1,48 \mathrm{~m}$
Double-coil system.

length of degaussing coil : 3,13m
Single-coil system.

## Notes to outline drawings on the following pages

1. Configuration of outer conductive coating may be different but will contain the contact area as shown in the drawing.
2. To clean this area, wipe only with a soft lintless cloth.
3. One of the four mounting lugs may deviate $1 \mathrm{~mm}(0,04 \mathrm{in})$ max. from the plane of the other three lugs. This deviation is incorporated in the tolerance of $\pm 1,8 \mathrm{~mm}(0,07 \mathrm{in})$.
4. Minimum space to be reserved for mounting lug.
5. The position of the mounting screw in the cabinet must be within a circle of $9,5 \mathrm{~mm}(0,37 \mathrm{in})$ diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of $311,4 \times$ $243,2 \mathrm{~mm}(12,26 \times 9,57 \mathrm{in})$.
6. Co-ordinates for radius $R=11,6 \mathrm{~mm}(0,46 \mathrm{in}) ; x=126,98 \mathrm{~mm}(4,999 \mathrm{in}) ; y=90,76 \mathrm{~mm}(3,573 \mathrm{in})$.
7. Not applicable.
8. The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. After mounting of the tube in the cabinet note that the position of the base can fall within a circle, having a diameter of max. $50 \mathrm{~mm}(1,968 \mathrm{in})$, concentric with an imaginary tube axis.
The mass of the mating socket with circuitry should not be more than 150 g , maximum permissible torque is 40 mNm .
9. Small cavity contact J1-21, IEC 67-III-2.
10. The $X, Y$ and $Z$ reference points are located on the outside surface of the face plate $3,2 \mathrm{~mm}$ ( $0,13 \mathrm{in}$ ) beyond the intersection of the minor, major and diagonal screen axis respectively, with the minimum published screen.

Fig. 13.

RECOMMENDED OPERATING CONDITIONS (cathode drive)
The voltages are specified with respect to grid 1.

| Anode voltage | $\mathrm{V}_{\mathrm{a}, \mathrm{g} 4}$ | 25 kV |
| :--- | :--- | :--- |
| Grid 3 (focusing electrode) voltage | $\mathrm{V}_{\mathrm{g} 3}$ | 6,6 to $7,5 \mathrm{kV}$ |
| Grid 2 voltage | $\mathrm{V}_{\mathrm{g} 2}$ | see Fig .14 |
| Luminance at the centre of the screen* | L | $80 \mathrm{~cd} / \mathrm{m}^{2}(23,2$ foot lambert $)$ |

Fig. 14 Spot cut-off design chart.
Grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) adjusted for highest gun spot cut-off voltage $\mathrm{V}_{\mathrm{k}}=140 \mathrm{~V}$.
Remaining guns adjusted for spot cut-off by means of cathode voltage.
$\mathrm{V}_{\mathrm{g} 2}$ range 390 to 760 V
$\mathrm{V}_{\mathrm{k}}$ range 110 to 140 V .
Adjustment procedure:
Set the cathode voltage ( $\mathrm{V}_{\mathrm{k}}$ ) for each gun at 140 V ; increase the grid 2 voltage ( $\mathrm{V}_{\mathrm{g} 2}$ ) from approx. 400 V to the value at which one of the colours becomes just visible. Now decrease the cathode voltage of the remaining guns so that the other colours also become visible.

* Tube setting adjusted to produce white of $9300 \mathrm{~K}+27 \mathrm{M}$. P.C.D. $(x=0,281, y=0,311)$, focused
raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

## EQUIPMENT DESIGN VALUES (each gun if applicable)

The values are valid for anode voltages between 20 and $27,5 \mathrm{kV}$. The voltages are specified with respect to grid 1.

| Grid 3 (focusing electrode) voltage   <br> Grid 2 voltage and cathode voltage <br> for visual extinction of focused spot $\mathrm{V}_{\mathrm{g} 3}$ 26,6 to $29,8 \%$ of anode voltage <br> Difference in cut-off voltages between <br> guns in any tube $\mathrm{V}_{\mathrm{g} 2}$ and $\mathrm{V}_{\mathrm{k}}$ see Fig. 14 <br> Cathode drive characteristic $\Delta \mathrm{V}_{\mathrm{k}}$ lowest value $\geqslant 80 \%$ of highest value <br> Grid 3 (focusing electrode) current  see Fig. 15 <br> Grid 2 current $\mathrm{I}_{\mathrm{g} 3}$ -5 to $+5 \mu \mathrm{~A}$ <br> Grid 1 current at $V_{k}=100 \mathrm{~V}$ $\mathrm{I}_{\mathrm{g} 2}$ -5 to $+5 \mu \mathrm{~A}$$\quad$$\mathrm{I}_{\mathrm{g} 1}$ | -5 to $+5 \mu \mathrm{~A}$ |

## Deflection unit

Maximum operating temperature

## LIMITING CIRCUIT VALUES

Grid 3 circuit resistance
Grid 1 to cathode circuit resistance (each gun)

| $R_{g 3}$ | $\max$. | $30 \mathrm{M} \Omega$ |
| :--- | ---: | ---: |
| $R_{g 1 k}$ | $\max$. | $0,75 \mathrm{M} \Omega$ |

## Notes

1. Absolute Maximum rating system.
2. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended first to make the necessary adjustments for normal operation.
3. Operation of the tube at lower voltages impairs the luminance and resolution.
4. The short term average anode current should be limited by circuitry to $600 \mu \mathrm{~A}$.
5. For maximum cathode life and optimum performance, it is recommended that the heater supply be designed for 6,3 V at zero beam current.

## FLASHOVER PROTECTION

With the high voltage used with this tube (max. $27,5 \mathrm{kV}$ ) internal flashovers may occur. As a result of the Soft-Flash technology these flashover currents are limited to approx. 60 A offering higher set reliability, optimum circuit protection and component savings.
Primary protective circuitry using properly grounded spark gaps and series isolation resistors (preferably carbon composition) is still necessary to prevent tube damage. The spark gaps should be connected to all picture tube electrodes at the socket according to the figure below; they are not required on the heater pins. No other connections between the outer conductive coating and the chassis are permissible. The spark gaps should be designed for a breakdown voltage at the focusing electrode (g3) of 11 kV $\left(1,5 \times V_{g 3}\right.$ max. at $\left.V_{\mathrm{a}, \mathrm{g} 4}=25 \mathrm{kV}\right)$, and at the other electrodes of 1,5 to 2 kV .
The values of the series isolation resistors should be as high as possible ( $\mathrm{min} .1,5 \mathrm{k} \Omega$ ) without causing deterioration of the circuit performance. The resistors should be able to withstand an instantaneous surge of 20 kV for the focusing circuit and 12 kV for the remaining circuits without arcing. Additional information is available on request.

Fig. 16.

## X-RADIATION LIMIT

Maximum anode voltage at which the X -radiation emitted will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ at an anode current of $300 \mu \mathrm{~A}$

| entire tube | $31 \mathrm{kV} *$ |
| :--- | :--- |
| face-plate only | 33 kV |

## Warning:

If the value for the tube face only is used as design criterion, adequate shielding must be provided in the monitor for the anode contact and/or certain portions of the tube funnel and panel skirt to insure that the X -radiation from the monitor is attenuated to a value equal to or lower than that specified for the face of the tube.
Maximum voltage difference between anode and focus electrode at which the $X$-radiation will not exceed $0,5 \mathrm{mR} / \mathrm{h}$

## Warning:

If the voltage value above can be exceeded in the monitor additional attenuation of the X -radiation through the tube neck may be required.
The X-radiation emitted from this display tube, as measured in accordance with the procedure of JEDEC Publication No. 64D, will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ throughout the useful tube life when operated within the 'Design maximum ratings'.
The tube should not be operated beyond its 'Design maximum ratings' stated above, but its X -radiation will not exceed $0,5 \mathrm{mR} / \mathrm{h}$ for anode voltage and current combinations given by the isoexposure-rate limits characteristics shown on the next page.
Operation above the values shown by the curve may result in failure of the monitor to comply with the Federal Performance Standard of the U.S. for Television Receivers, Section 1020. 10 of Part 1020 of Title 21, Code of Federal Regulation (PL90-602) as published in the Federal Register Volume 38, No. 198, Monday, October 15, 1973.
Maximum X-radiation as a function of anode voltage at $300 \mu \mathrm{~A}$ anode current is shown by the curve on the next page. X -radiation at a constant anode voltage varies linearly with anode current.

[^40]

Fig. $170,5 \mathrm{mR} / \mathrm{h}$ isoexposure-rate limit curve.

Fig. 18 X -radiation limit curve at a constant anode current of $300 \mu \mathrm{~A}$.

## WARNINGS

## X-radiation

Operation of this colour display tube under abnormal conditions which exceed the $0,5 \mathrm{mR} / \mathrm{h}$ iso-dose rate curve shown on the preceding page may produce soft X -rays which may constitute a health hazard on prolonged exposure at close range unless adequate external screening is provided. Precautions must therefore be exercised during servicing of monitors using this tube to ensure that the anode voltage and other tube voltages are adjusted to the recommended values so that the 'Design maximum ratings' are not exceeded.

## Replacement

This display tube incorporates integral X-radiation and implosion protection and must be replaced with a tube of the same type number or a recommended replacement to assure continued safety.

## Shock hazard

The high voltage at which the tube is operated may be very dangerous. The monitor should include safeguards to prevent the user from coming in contact with the high voltage. Extreme care should be taken in servicing or adjustment of any high-voltage circuit.
Caution must be exercised during the replacement or servicing of the display tube since a residual electrical charge may be held by the high-voltage capacitor formed by the external and internal conductive coatings of the display tube funnel. To remove any residual charge, short the anode contact button, located in the funnel of the tube, to the external conductive coating before handling the tube. Discharging the high voltage to isolated metal parts such as cabinets and control brackets may produce a shock hazard.

## Handling

Assemblies should be kept in the shipping box or similar protective container will just prior to installation. Wear heavy protective clothing, including gloves and safety goggles with side shields, in areas containing unpacked and unprotected tubes to prevent possible injury from flying glass in the event a tube breaks. Handle the tube with extreme care. Do not strike, scratch or subject the tube to more than moderate pressure. Particular care should be taken to prevent damage to the seal area.
The packing should incorporate sufficient cushioning so that under normal conditions of shipment or handling an impact acceleration of more than 35 g is never applied to the tube.

Fig. 19 Simultaneous excitation of red, green and blue phosphor, measured in a tube, to produce white of $x=0,281, y=0,311$. Exact shape of the peaks depends on the resolution of the measuring apparatus. Colour co-ordinates:

$y$
$\overline{0,340}$
0,600
0,060

## DEGAUSSING

The display tube has an internal magnetic shield. This shield and the shadow mask with its suspension system may be automatically degaussed by a coil mounted on the cone of the picture tube as shown in Fig. 20.

Fig. 20 Position of degaussing coil on the display tube; dimensions are given in mm , and in inches between brackets.

For proper degaussing an initial magnetomotive force (m.m.f.) of 600 ampere-turns is required in the coil. This m.m.f. has to be gradually decreased. In the steady state, no significant m.m.f. should remain in the coil ( $\leqslant 0,6$ ampere-turns).
If single-phase power rectification is used, provision should be included to prevent asymmetric distortion of the a.c. voltage applied to the degaussing circuit due to high d.c. inrush currents.
An example of a degaussing circuit and coil data for various mains voltages are given below.

Fig. 21 Degaussing circuit using dual PTC thermistor.

## CONVERGENCE AND RASTER SPECIFICATION

The maximum misconvergence after 15 min operation is given in Table 1.
Test conditions (all voltages are measured with respect to grid 1)

| Heater voltage | $\mathrm{V}_{\mathrm{f}}$ | $6,3 \mathrm{~V}$ |
| :--- | :--- | :--- |
| Grid 2 voltage | $\mathrm{V}_{\mathrm{g} 2}$ | 525 V |
| Grid 3 voltage | $\mathrm{V}_{\mathrm{g} 3}$ | to be adjusted for focus at screen centre, using cross-hatch pattern <br> or characters H, at anode current of $300 \mathrm{\mu}$ (peak) per gun |
| Anode voltage | $\mathrm{V}_{\mathrm{a}}$ | 25 kV <br> cross-hatch pattern |
| Test pattern |  |  |
| Ambient temperature | $\mathrm{T}_{\mathrm{amb}}$ | $25 \pm 5^{\circ} \mathrm{C}$ |

## Notes

1. Misconvergence is the distance between centres of the red, green, blue lines at the screen using rectangular co-ordinates.
2. Anode and/or focusing voltage and terrestrial magnetism affect the static convergence performance.

Table 1 Maximum misconvergence after 15 min operation

(C) Philips Export B.V. 1986

This information is furnished for guidance, and with no guarantee as to its accuracy or completeness; its publication conveys no licence under any patent or other right, nor does the publisher assume liability for any consequence of its use; specifications and availability of goods mentioned in it are subject to change without notice; it is not to be reproduced in any way, in whole or in part, without the written consent of the publisher.

[^0]:    * Supersedes the IC06N 1985 edition and the Supplement to IC06N issued Autumn 1985.

[^1]:    * In the region of 66 mm from the neck end, the maximum diameter is $23,2 \mathrm{~mm}$.

[^2]:    * For optimum picture performance it is recommended that the cathodes are not driven below +10 V .

[^3]:    * Aberration Reducing Triode.

[^4]:    * Aberration Reducing Triode.

[^5]:    * In the region of 66 mm from the neck end, the maximum diameter is 23,2 mm .

[^6]:    * In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

[^7]:    * In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

[^8]:    * Tube settings adjusted to produce white of $6500 \mathrm{~K}+7$ M.P.C.D. $(x=0,313, y=0,329)$ focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

[^9]:    * In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

[^10]:    * Aberration reducing triode.

[^11]:    * Aberration Reducing Triode.

[^12]:    * Tube settings adjusted to produce white $D(x=0,313, y=0,329)$, focused raster, current density $0,4 \mu \mathrm{~A} / \mathrm{cm}^{2}$.

[^13]:    *. In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

[^14]:    * In the region of 70 mm from the neck end, the maximum diameter is 30 mm .

[^15]:    5 mm

[^16]:    * In the reqion of 70 mm from the neck end, the maximum diameter is 30 mm .

[^17]:    * Aberration Reducing Triode.

[^18]:    * Point $x$

[^19]:    * For optimum picture performance it is recommended that the cathodes are not driven below +1 V .

[^20]:    * Aberration Reducing Triode.

[^21]:    * Point
    ** Diagonal.
    - Point

[^22]:    * For optimum picture performance it is recommended that the cathodes are not driven below +1 V .

[^23]:    * Aberration Reducing Triode.

[^24]:    * In the region of 66 mm from the neck end, the maximum diameter is $23,2 \mathrm{~mm}$.

[^25]:    * 300 ampere-turns for double-coil system; 700 ampere-turns for single-coil system.
    ${ }^{* *} \leqslant 0,3$ ampere-turns for double-coil system; $\leqslant 0,6$ ampere-turns for single-coil system.

[^26]:    * Aberration Reducing Triode.

[^27]:    * This rating applies only if the anode connector used by the set maker provides the necessary attenuation to reduce the X -radiation from the anode contact by a factor equal to the difference between the anode button isoexposure-rate limit curve and the isoexposure-rate limit curve for the entire tube.

[^28]:    * Aberration Reducing Triode.

[^29]:    * In the region of $78,5 \mathrm{~mm}(3,09 \mathrm{in})$ from the neck end, the maximum diameter is $30 \mathrm{~mm}(1,18 \mathrm{in})$.

[^30]:    * This rating applies only if the anode connector used by the set maker provides the necessary attenuation to reduce the X -radiation from the anode contact by a factor equal to the difference between the anode button isoexposure-rate limit curve and the isoexposure-rate limit curve for the entire tube.

[^31]:    * Aberration Reducing Triode.

[^32]:    * In the region of $78,5 \mathrm{~mm}(3,09 \mathrm{in})$ from the neck end, the maximum diameter is $30 \mathrm{~mm}(1,18 \mathrm{in})$.

[^33]:    * This rating applies only if the anode connector used by the set maker provides the necessary attenuation to reduce the X -radiation from the anode contact by a factor equal to the difference between the anode button isoexposure-rate limit curve and the isoexposure-rate limit curve for the entire tube.

[^34]:    * Aberration Reducing Triode.

[^35]:    * Point X
    ** Diagonal.
    - Point

[^36]:    * Point (x. ** Diagonal.

    4 Point (y).

[^37]:    * Aberration Reducing Triode.

[^38]:    * For optimum picture performance it is recommended that the cathodes are not driven below + 1 V .

[^39]:    * Pixel = picture element.

[^40]:    * This rating applies only if the anode connector used by the set maker provides the necessary attenuation to reduce the X -radiation from the anode contact by a factor equal to the difference between the anode button isoexposure-rate limit curve and the isoexposure-rate limit curve for the entire tube.
