NOW AVAILABLE FOR VAX

# USER-11: POWERFULLY PRODUCTIVE.

People productivity. It's more important than ever. And a good database system can mean *real* productivity.

USER-11 is a high-performance database system.

It is a fact: Software designed with USER-11 is built more quickly, operates more reliably, and performs better than other software techniques.

USER-11 is unique. It's easy to install. Easy to learn. And easy to apply. Adaptive tools and a standard approach ensure that maintenance is easier than ever.

A key to USER-11's success is its powerful, dictionary-based modules. Software developers simply describe and assemble these modules to create custom business packages—at an unprecedented rate.

Naturally USER-11 is supported with excellent documentation and a variety of training options for beginner to expert. Our commitment is to your complete satisfaction.

Whether you are a software provider or a software user, we guarantee you will be delighted.

Ask us about USER-11 and our family of business software products, or better yet, ask a *productive* USER!

# Mercurion 1™

## The page-per-second non-impact printer matched to your computer

...and priced to change all your thinking.

Now Mercurion 1 makes non-impact printing as cost-effective as it is performance-effective. Revolutionary ion deposition imaging—far simpler and more reliable than laser xerography—gives you letter quality printing, and on standard 8½ x 11 paper now demanded by government and most businesses. All of this, plus 5,280 lines-per-minute.

At an initial cost less than 50% that of conventional non-impact printer systems, Mercurion 1 also substantially reduces maintenance costs, downtime, and per-page operating costs. And does it quietly (55dBA).

A simple, user-friendly control panel lets you set margins and tabs, select fonts (up to 8 styles and sizes), program number of copies (1 to 255), feed a single sheet for alignment, put the system through self-test, and much more. Resolution is 240 x 240 pixels, and you can select landscape or portrait orientation.

Mercurion 1 is plug-compatible with all popular mini- and mainframe computers. It's designed to replace your existing impact line printer directly—no operating system software changes. We even supply the cable.

And you can count on SSI quality and service support. Thousands of our printer systems are in use worldwide.

Call us or mail the coupon below for a fully-detailed brochure on this great new printer system.

# CONTENTS

<b>A GRAPHIC STATEMENT / Kevin Sard</b> .....	<b>8</b>
I have seen more good looking plotters at the trade shows. Now I know what to do with them. For not too much money you can have your computer draw charts and graphs.	
<b>SERVICE MODULE APPROACH TO MULTI-TASKING USE OF RMS11K / C.W. Stahle</b> ..	<b>12</b>
The question of when to use a control task to access data and then have the users send/receive messages to get the individual data records is not easily answered. It works for this application.	
<b>STRETCHING THE CANVAS IMPACT ANALYSIS / Robert J. Walsh</b> .....	<b>14</b>
System Development Methodology: A technique for project management, is the subject of this continuing series.	
<b>AFFORDABLE HIGH-SPEED NON-IMPACT PRINTERS BEING BASED ON ION DEPOSITION TECHNOLOGY / James W. Rule</b> .....	<b>20</b>
High speed (laser fast) printing for your DEC system at more economical prices requires a new technology.	
<b>UPGRADE PATH FOR H11 [AND LSI-11] / Ed Judge</b> .....	<b>33</b>
How about a DEC computer in a kit! It used(!) to be available.	
<b>RECOVERY SYSTEM / Brian Johnson</b> .....	<b>44</b>
Have you ever had to restore a system from a BACKUP tape? Did you lose any data? This application will restore data right up to the system failure.	
<b>PROGRAMMER'S NOTEBOOK</b>	
<b>Unemployed Programmers? / Rick Scherle</b> .....	<b>54</b>
Welcome to Rick, who promises to provide stimulating and important points of view for us all.	
<b>Converting Numbers to String Representations / Steven Davis</b> .....	<b>56</b>
In our continuing effort to bring more and more PROFESSIONALS to our readers we are happy to be able to publish articles from the people at Software Techniques. Although we have had articles on this type of function, it has never been explained this well before. If we could all explain things this well...	
<b>A PRIDE OF EAGLES / R.D. Mallery</b> .....	<b>62</b>
A new disk technology replaces the old. "Their time had come..."	
<b>UNIX CONSIDERED / Barry Shein and Steven Sneddon</b> .....	<b>70</b>
In another continuing series we explore operating systems and their capabilities. UNIX is just one of these. Look for more UNIX articles in future issues.	
<b>PROGRAMMING THE FLOATING POINT PROCESSOR</b>	
<b>(or, Those Ferocious Floaters) / Bob Meyer</b> .....	<b>79</b>
How and what the FPP does is the subject of our "MACRO" man this issue. Now Bob, what does the CIS processor do in a "44"?	
<b>PORTACALC — A New (FREE) DEC Spreadsheet / Glenn C. Everhart</b> .....	<b>90</b>
The DECUS library has some good and some not so good software. Here is one entry that could be of interest.	
<b>FROM THE RT-11 EDITOR —</b>	
<b>How to Use RT-11 with Disks with Bad Blocks / Arthur Edward Groulx</b> .....	<b>94</b>
The "new" media used for higher and higher density disks almost guarantee that there will be bad blocks; "error free" disks will become a thing of the past. Operating with these pack errors is important to all users.	
<b>RSX-11M TO RSX-11M PLUS MIGRATION / Allen A. Watson</b> .....	<b>103</b>
And I thought all migration was to a VAX! There are interesting and sometimes subtle differences between M and M-PLUS.	
<b>USING A RESIDENT LIBRARY FOR COMMUNICATION</b>	
<b>BETWEEN JOBS / Robert Grund</b> .....	<b>114</b>
If you hesitated using SEND/RECEIVE because of high CPU overhead, maybe this is the answer. The idea of using shared libraries between programs (read/write of course) is useful to all operating systems that support such a concept.	
<b>THE ELEMENTS OF SOFTWARE SUPPORT: The Softness of Software / John M. Gram</b>	<b>116</b>
The problem of support will continue to grow as prices for software fall (because we sell so many) and prices for support people go up. What happens when a PDP-11 product which has sold hundreds of licenses migrates to the PROFESSIONAL 350 where you can sell thousands and the support problem goes up by an order of magnitude.	
<b>MAPGRF / Kelly Felkins</b> .....	<b>120</b>
A graph of a map from the task builder. Now if we just had that nice plotter I saw the other day we could...	
<b>MACRO AND THE CLASSROOM / Alan Hagerman</b> .....	<b>127</b>
The PDP-11 and its MACRO assembler are popular classroom products for teaching assembly language. This is one experience.	
<b>ADVANCED EDT — PART 3 / Jeffery Gold</b> .....	<b>128</b>
EDT continues in popularity. Here are more good ideas on how to use this very fine product.	
<b>BENCHMARKING DEC AND DEC COMPATIBLE HARDWARE SYSTEMS UNDER RSTS/E WITH YOUR APPLICATIONS / J. Peter Bryce</b> .....	<b>134</b>
Benchmarking is close to our heart; there will be more in a continuing series on performance.

## FROM THE PUBLISHERS...

### GENERATION GAP

R.D. Mallory

I had another in a recent series of sudden, sobering visions the other day:

In two years, everything we used to call a PDP-11 will be replacable by a small box or two under the desk. Not only replacable, but the replacement will be an economic necessity!

Just as the change from RM/RP to RA or Eagle is an economic imperative today (massive cash savings in electricity, service and air conditioning plus super speed and low cost per megabyte), so the 70's and 44's will roll out to pasture . . . not because they don't work, but because it no longer makes economic sense to run them.

I am going to retire a 70 in the next year or so that has run 24/7 since December 1975. In all that time, I remember only one or two processor related service calls. The death knell will be the monthly field service and utility bills.

There must be some awful pressure up in Maynard right now to come up with a VAX chip set. But wait a minute . . . What will a chip set with J-11 speed or better do to all those lovely 750s and 730s out there? The answer is: Exactly what the Micro-11 with a J-11 will do to all those lovely 70s and 44s. The only problem is that it will be FIVE YEARS TOO SOON!

This brings to mind some problems that were faced by a number of mainframe leasing companies when IBM came out with the 43xx series and made obsolete an installed base worth billions.

So, if you come out with the VAX chip, you blow the 750 and 730 base. If you don't, you get eaten alive by all the other 32-bit sets now on the market. Making a slower chip is hardly worth the effort. Oh why won't technology wait for economics, depreciation and the IRS???

### OUTPUT

Carl B. Marbach

There is a revolution about to happen and the surprise is that this revolution is not about disks; it's output devices. In 1966 DEC delivered an ANALEX (spelling?) 128 (!) column high speed line printer with the PDP-6 computer I used at the University of Pennsylvania. It had 128 hammers, made lots of noise, broke only in moderation and weighed about 1000 pounds. The printer that came with our last PDP-11/70 weighed less, cost less, printed a little slower, had 132 hammers and all in all was a lot like the 1966 version. While the electronics have changed a lot, the mechanics are very similar to the good old days.

A promising printer technology emerged with the laser printers from IBM and XEROX but these had three serious drawbacks; they were expensive, they were expensive and they were expensive. Sure,

they were non impact, but if you wanted multiple copies they were fast enough to print it twice.

For DEC systems these printers usually need a "black box" to interface with the computer. To make the cost seem more reasonable, like most "big" equipment, they can be rented. While laser and xerographic printers are a step in the right direction, the price/performance ratio just doesn't seem to be what we need, and the costs haven't been dropping the way most computer equipment usually does as a product matures.

In this issue Southern Systems explains a new technology that promises to have the speed of the laser printers, but is more reasonable in cost. It will also interface to our computers exactly like conventional printers. Bringing a product like this, using a new technology, to market is difficult in the best of times. With the economy in the doldrums for the last couple of years, we have sorely missed efforts such as this. I hope that with the improving economic picture, the outlook for new products coming to market will also brighten.

Printers are not the only devices that will benefit from an improved economy, the whole industry will get a shot in the arm. Micro computers have stolen the show for too long; it's time the whole computer industry moved forward at an exciting pace. 1983/1984 should be two of the most exciting years for our industry—stay tuned in.

### WELCOME

There are some new additions in this issue of the DEC PROFESSIONAL. Our resident RSX editor is Jim McGlinchey, and assuming the duties of West coast representative and author of "Programmers Notebook" is Rick Scherle. You may also have noticed that we have a continuing series on RT-11 by our RT-11 editor north of the Border.

All this is our continuing effort to bring the best in professional and technical articles to you. These people will not only be writing, but also soliciting more contributions from the user community. We know all of you join us in welcoming these important additions to the people who bring you the DEC PROFESSIONAL. Welcome aboard!

We thought about captioning our cover, but it might be more fun to let all of you out there have a try at it. DEC PRO T-Shirt to some of the best ones. How about a start: "Best field service rep we ever had," "good thing I don't have a memory management board this big," "I'll fix you if you fix me." Go to it!

# LETTERS TO THE DEC PRO . . .

Send letters, comments, photos, etc. to: Letters to the DEC PRO, Box 362, Ambler, PA 19002.

I am interested in purchasing a spelling dictionary for my DECmate. Do you know of any software firm that has developed one?

C.W. Thomas, Supervisor  
Engineering Administration  
Colt Industries, Burbank, CA

*We enlisted the aid of our colleague Larry H. Eisenberg, Encino, CA, on this one. Larry's response in part, "... the current status of the spelling dictionary for use on the DECmates. (Like all DIGITAL futures, it's up in the air, although there has been a commitment to bring it out. I am informed that DIGITAL bought an existing dictionary and will use it on the DECmate II, probably in Version 2, and may be able to include it with the DECmate I — but no promises.)*

*If nothing else, Mr. Thomas was interested in joining our Local Users Group, so he may have gotten far more than he originally bargained for when he wrote to you."*

\* \* \*

That was an interesting article on BUGGING (V2,#1). Speaking of bugs, let me tell you what bugs me... Reading halfway through an article before realizing that it isn't aimed at TEACHING me something, but at SELLING me something!! I can't believe that the DEC PRO is so starved for copy that it continues to publish type about software that some company will SELL to you (similar to software, incidentally that I saw running on a PDP-8 in 1974 at DEC). Since I'm busy throwing negative, I might note to the authors of said article that genius is never a substitute for experience. With an IQ of 164, and total recall, I still find that experience is the tool that I use the most, not raw brain power. Enough said.

I next address myself to the programmer (Mary Starr) who wrote a letter that appeared in the same issue. The letter expounded upon the need for programmers to be grammatical and proofreading wizards. I think she has overstressed the importance of grammar in a magazine geared to a

technical reader. Personally, I get a good chuckle when I see grammatical errors, especially the "dangling participle" in the first sentence of her last paragraph!!

Then, in the same issue, there was some UNIX manager complaining about the lack of UNIX articles. Why doesn't he write some? I use "C" under UNIX and XENIX, PL/1 on IBM equipment, and PASCAL on micros, but I'm not going to write about them because they don't constitute the majority of the work that I do. People who wear UNIX underwear write UNIX articles. I wear RSTS underwear (and teeshirts) and write RSTS articles. He should take special note of the next paragraph...

In closing, let me ask that the readers of this magazine rake out those pieces of code that they deem as their personal triumphs over difficult to understand manuals, and send them in for publication. I would rather wade through ten articles that are technical (even about UNIX), finding one that can help me in future endeavors, than wade through one article that is trying to SELL me something. If I want to be sold something, I'll renew my subscription to BYTE magazine (which measures its advertisement copy by the pound). I am making an effort to send one or two articles to the DEC PRO or the RSTS PRO every few months, to help increase the technical balance that the magazines present. YOU OTHER READERS CAN HELP TOO!!!

If you're not part of the solution, you're part of the problem.

Steve Roy  
Diversified Consulting Co.  
Bloomfield, CT

\* \* \*

For the past year or so I have read articles and editorials on the general subject of computer security in your magazines, The DEC\* Professional and RSTS Professional. I say "your magazines" because R.D. Mallery and Carl B. Marbach are listed as editors of each.

My dismay grew as I watched Mallery publish security articles, apparently in the public interest, back-to-back with a full page ad for his (your?) product, LOCK-11.

I believe the following example would be the moral equivalent.

The City Mayor says, "We are all in danger. Arm yourselves." The People respond, "We know little of arms. What shall we do?"

"You're in luck," says the Mayor, "I can sell you what you need."

Conflict of interest? Abuse of office? Or is the Mayor acting in his proper role by enlightening his constituents about a clear and present danger and then generously offering a solution to the problem.

Our national law-makers have decided that it is illegal for office holders to sell goods and services to their constituents, no matter how noble their intentions. Indeed, they must rid themselves of all conflicts of interest before assuming office.

That does not seem to be the policy of your publications. Like the Mayor, Mallery repeatedly calls his readers' attention to the subject of computer security. He even lectures on it.

The People, his readers, may respond, "You have made us aware with your many articles and presentations. But you never tell us what products to buy to protect ourselves."

"That would be unethical." (But by coincidence, on Page 51 my magazine (heaven forbid, not me!) has a full page ad on LOCK-11 that may just provide your answer.)

An exaggeration? Maybe. But I find the activities of the Mayor and Mallery to be very similar. Both sound the alarm for "More security." Both will personally benefit from their apparent concern for the public interest. Both use their office in a way not intended.

So what's it to me?

First, I feel betrayed as a reader of, and an advertiser in, your publica-

Attention  
DEC™ Users

# DILOG makes disk controllers.. because DEC\* does not live by tape alone

You know DILOG for superior tape drive controllers. What you may *not* know is how great our *disk* controllers are too.

DILOG offers you unmatched quality, ease of installation and economical operation for DEC emulating disk controllers. They'll interface with your favorites too—over 50 disk drive manufacturers in all.

And when you install DILOG, you'll be investing in your computer's future. Because DILOG controller boards include **Universal Formatting™**. All drive

parameters are programmed onto the header in each sector of the drive—instead of into components of the controller itself.

*So you can add new drives without having to replace PROMs or reprogram.*

Our catalog tells you all about DILOG's extensive line of disk controllers to emulate DEC. Send for it. Then the next time you're wondering how to satisfy your disk drives and your computer at the same time, just give them a good helping of DILOG.

# A GRAPHIC STATEMENT

By Keven Sard, Data Processing Design, Inc., Placentia, CA

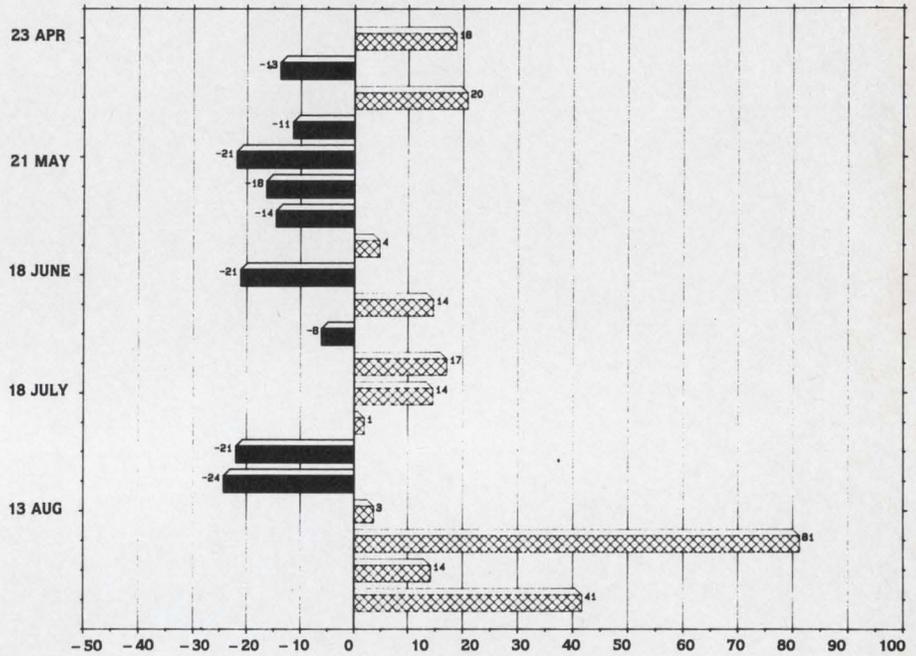

Do you have nightmares of being lost in a maze of \$100,000 CAD/CAM systems? Do you find you pay more attention to what is behind Dan Rather than to the news he presents? Do you believe that the only affordable business graphics package ever made is being kept a secret for subversive political reasons? Is your company's idea of user-friendly graphics a dull No. 2 pencil, and a dime store compass?

If you have answered any, or all, of these questions "yes," continue reading. You may find the cure for your nightmares in a new business graphics package from Data Processing Design, Placentia, CA.

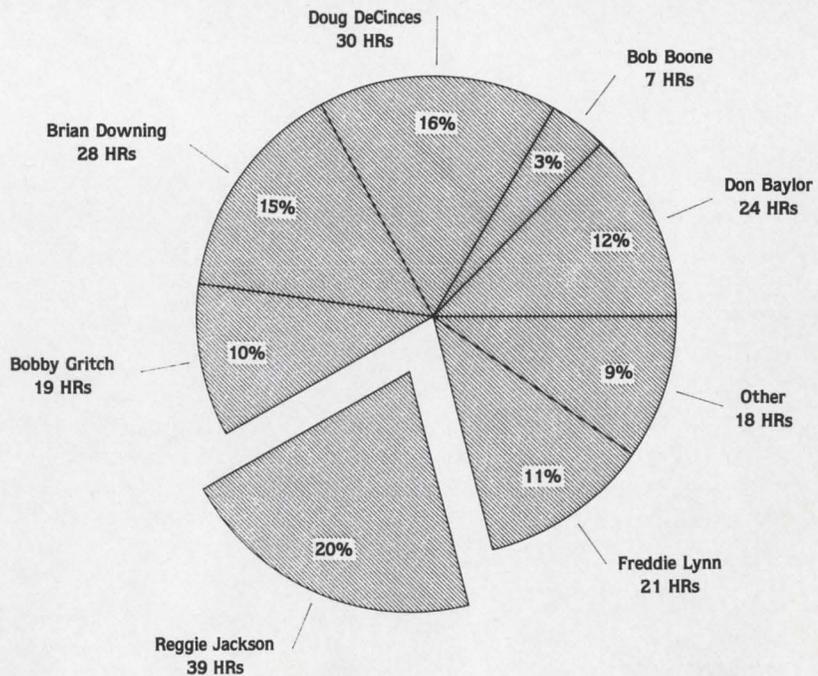

I grew up in an age when blood might be shed if someone tried to commandeer your IBM Selectric. So when truly user-friendly software came around for the DEC system we were using, it was a minor miracle. To think that the average guy on the subway could be trained to use a shared logic word processing system before he made his return trip . . . what an outstanding achievement in software. Never again to lose a diskette to those mysterious magnetic monsters that lurk on every secretary's desk, was something I had long awaited. Life seemed to sail by in multi-user bliss until someone in the office got the bright idea to incorporate graphs with written reports. So much for euphoria.

The problems with this idea were not as many as they were hard to overcome. First there was the question of software. It was hard to find, if not nonexistent. Then the question of operators. No one knew how to produce graphics. Then compatibility. Would it operate with our word processing system. The conclusion was easy to come to, but hard to swallow. We watched with strained emotions, not to mention the budget, as the new terminal was set up in the office, and the new operator took her place in front of the screen.

## Make Whitesmiths, Ltd. Part of Your Software Strategy.

Selecting software is really a game of strategy: positioning the right product at the right time for the most effective results.

At Whitesmiths, Ltd., our full line of software products is designed to do just that and more. Our time-tested compilers are available for five architectures, complete with Pascal translators and cross-support for a wide range of environments. From the MC68000, to the IBM PC, to the DEC Professional, our compilers and cross compilers cut software development time and reduce dependence on operating systems and instruction sets.

Idris, our exclusive operating system, is powerful, small and extremely portable. Written almost entirely in C, it runs where other operating systems can't even fit—on an MC68000 with no memory

management hardware, for example, or on a bank-switched 8080 or Z80. And it outperforms UNIX on comparable systems—an MC68000 with memory management hardware, for instance, or any PDP-11 or LSI-11. It even makes good use of a VAX, so you know you won't outgrow it!

In addition, our full line of Software A La Carte lets you select just the pieces you need to tailor our products for your unusual requirements. From portable libraries to special purpose tools, all A La Carte items are tested, easy to use, and very affordable.

To make things even simpler, Whitesmiths, Ltd. has introduced a new marketing tool: the Authorization Seal. Instead of hassling with complex license agreements

and other legal stumbling blocks, you simply affix a serially numbered Authorization Seal, issued with each sale, to any machine that retains a copy of our software. End of hassle. All our customers—end-users, OEMs, and sublicensors—benefit from the elimination of multi-tier licensing agreements and detailed record keeping.

Compilers, Idris, Software A La Carte, and the Authorization Seal: together they can position you for today's competitive market—and tomorrow's. Before you make your next move, call or write to Whitesmiths, Ltd. today. We'll be glad to help you play to win.

Whitesmiths, Ltd.,  
97 Lowell Road, Concord,

## Software Craftsmen

Visit us at DEXPO East, Booth #621

Since that time major improvements have been made in business graphics. DPD, best known for its word processing package, WORD-11, has recently started marketing the same concepts in user-friendly software with a graphics twist. The new package called IB GRAPH (Interactive Business Graphics) incorporates all that you could ask for in user-friendly software, plus the capability to turn out some very fine business graphics.

For those of you who are familiar with DPD's WORD-11 you may be sur-

prised by what might be called a "rambling" menu system. However, after a few hours of hands-on use, specifying, modifying and producing charts is a breeze. IB GRAPH has several modules, but you will probably spend most of your time with the Main Menu, the Data Editor, the Chart Specification Editor, and the Plot modules. The modules let you amble through over 600 options to customize your chart right down to the size of the tick marks. Or you can just as easily "load" the information into a chart

specification, and let IB GRAPH default to a chart that will meet most purposes. There is also a Translation Module that lets you convert DMS-500 ISAM, Block I/O, ASCII free format, RMS, CARD, TYPE-1, and WORD-11 and DECWORD List Processing format files into data groups. Plus a convenient Utility Module. It's amazingly simple, allowing the average office worker to quickly create line, bar, or pie charts.

If you still have a touch of paranoia derived from an experience at some graphics show you attended, consider this. IB GRAPH has a consistency checker. In case you're unfamiliar with the term let me explain. The IB GRAPH acts like a big brother. It lets you do as you please, mistakes and all, until you plot the chart. When you issue the command to plot, the Consistency Checker takes over, and informs you of any mistakes that will cause an incorrect plot. There are four levels of checking, ALL, PARTIAL, SUMMARY, and NONE. If only warning type errors are found IB GRAPH will ask if you still wish to plot. If you do nothing before the plot about the warnings IB GRAPH will change or ignore the cause of the warnings, helping you improve the appearance of the chart. The Consistency Checker can be invoked at the time of plot, or at any point while specifying the parameters of the chart.

As if this were not enough to get you through, there are Help Screens as well. Here again, a new twist has been added to a good idea. Help can be reached from any of the modules, and a LEAVE key puts you back where you left off. Perhaps the most impressive part of the Help Screens is while in the Plot Menu. If you invoke the Consistency Checker and receive errors, you may enter Help, and be told which option menus the mistakes were made in, and possible solutions for the problems. With this feature IB GRAPH makes it hard to make a bad chart.

By now you may have visions of the plush graphics you see between the covers of BUSINESS WEEK or U.S. NEWS, so let me set the record straight. IB GRAPH is not going to give you a graph in the shape of the United States, wallpapered in yen, showing the balance of trade between this country and Japan. If your vision of sugarplums just went "poof," wait a

## DECsystem-10/20 Users...

## Mainframe Modeling at a Micro Price

- BBL II+ is a true decision support language, not a spreadsheet package
- Self-documenting models that look and read like English
- Easy to learn and use, yet incredibly powerful
- Built-in editor, loader and runtime system
- Fast, efficient and user-friendly — installs in minutes
- Delivered with state-of-the-art documentation
- BBL II+ "Starter Kits" cost just \$95, including complete BBL II+ documentation, the BBL II+ application library and a 90-day trial copy of the BBL II+ system

If you own or use any standard DECsystem-10 or DECSYSTEM-20, you can finally get the mainframe modeling system you need, at a price you can afford... just \$2950! Prove it for yourself with a BBL II+ "Starter Kit". Call or write today for complete details.

**BBL II+ Available Now... Just \$2950<sup>00</sup>**

DOW JONES DAILY  
LOW, HIGH and CLOSE

minute. IB GRAPH will show you the balance of trade reflected in a pie chart, or bar chart, or line chart. It will allow you to have stacked bars, bars with depth, patterned bars, solid bars, vertical or horizontal bars. The variations of line charts are just as numerous. You can get lines with point markers, shaded to the base line, stacked lines and more. Pie charts options include exploded segments, and segment descriptions that are printed inside, or outside the pie. Remember, there are over 600 options to chose from.

IB Graph requires a VT100 with the advanced video option, or any of the equivalent DEC terminals like the VT131 or VT132. IB GRAPH supports the VT125 terminal for displaying charts on-screen in black and white. An appropriate color monitor allows multi-color display.

## SERVICE MODULE APPROACH TO MULTI-TASKING USE OF RMS11K

By C.W. Stahle, Avon Products, Inc., 9 West 57th Street, New York, NY 10019

In putting together a terminal driven multi-tasking application system under RSX-11M, the file access method must be carefully evaluated to avoid the 'deadly embrace' for files between tasks, the extreme overhead of opening and closing files by every task, or the overhead of using a general purpose file handler like RMS-11K.

In the design states of such a system, Avon Products, Inc. was faced with this problem. The initial implementation of the system incorporated RMS-11K into every task, without resident libraries due to machine size (PDP 11/34). In order to minimize memory requirements per task, the most highly overlaid version of RMS-11K was employed. To prevent the deadly embrace, file opening and closing was also performed by every task which updated files.

The result of this implementation, predictably, was terminal response times which were better measured with a calendar than with a stop watch. Disk activity due to overlays was phenomenal.

Forced by this extreme response time situation to do a system redesign, Avon chose the service module approach to file handling. The design of the service module incorporated the following features:

- A record handling front end to hold record requests during the actual file I/O.
- Record locking during I/O operations.
- Substitution of send/receive subroutines for the RMS-11K calls (DBGET, DBPUT, DPUPDATE, DPDELETE) to get to the single, less overlaid RMS-

11K resident in the service module.

- Tape (or disk-journaling of all record update activity (before and after images) by the service module.
  - File status handling, with the five most active files kept OPEN during the entire operating day.
  - Time out handling for tasks which do not complete (purging the 'lock-table').
  - Error interpretation for clear console display for file errors.
- Implementation of the Service Module approach, implemented in BASIC-PLUS-2, provided a response time solution which made the application a success, with the added benefits of file control through journaling.

# MEMORANDUM

TO: **DEC Q-BUS/UNIBUS USERS**  
FROM: **SPECTRA LOGIC CORPORATION**

# STRETCHING THE CANVAS-IMPACT ANALYSIS

By Robert J. Walsh, Winter Park, FL

Someone asks you to deliver a rush package from your Chicago office to Springfield. On the surface the request sounds reasonable. You hop in your car and you're on your way. Five hours later you're in Springfield, Illinois. Unfortunately, the package was to be delivered to Springfield, Massachusetts, and its contents were needed one hour earlier. Your project failed. What went wrong?

The driver assumed his instructions were complete. The warehouse supervisor assumed the driver was intelligent. The president of the corporation assumed his employees were competent.

The package contained a live, biological culture that took five years and three million dollars to develop. Since the president assumed the culture would be properly refrigerated on its air flight to Massachusetts, and it wasn't, it has long since been buried . . . with both employees.

Everyone assumed everyone else knew what was happening. No one bothered to question the details of the project. No one bothered to ask. A simple definition of a project is "something planned," which in many organizations is in direct conflict with standard corporate procedures.

Project planning begins with a request to do something. The Project Request may be verbal, formally written or scratched on the backside of a napkin at a business luncheon. In each case, someone somewhere wanted something done in some specified (usually extremely restrictive) time frame. The request can be expressed in one sentence or as part of a very lengthy worded narrative. It can originate from almost any level of management and can dictate virtually any unreasonable need.

The size of the corporation, EDP shop or project is immaterial when it comes to developing a quality product. Yes, larger projects will cost more if they fail, but a string of poorly planned and mismanaged smaller systems can be as devastating to corporate assets as the disastrous megasystem.

The development and management of a project's life cycle is more than tapping into the analyst's data bank of knowledge and expertise. It is utilizing a scientific approach for solving complex and often frustrating system development problems. It is a scientific methodology to take the analyst from project inception to completion and sign off.

Having a total System Development Methodology (SDM) in place prior to starting a project, is not only a necessity for total project control and continuity, but it is a must.

The first article in this series outlined an eight phase SDM. This article will define the first phase of project development, the Initial Impact Phase.

The number of phases, sub-phases and tasks, established and defined within the project's development life cycle, will vary from corporation to corporation, generally based on corporate needs, policies and procedures. The prime consideration is not the number of checkpoints built into the SDM, but the necessity for a formal corporate SDM. The reasons for a formal SDM are many, but the most fundamental are standardization, formalization, ease of systems maintenance and user-friendly documentation, not to mention the personal satisfaction of doing it right the first time!

There are many vendor type SDMs on today's market, ranging in price from \$20,000 to \$150,000, depending on the number of frills and lace you're willing to purchase. However, most corporations should be able to develop their own SDMs in a relatively short time, using the outlines, checklists and general guidelines found in these series of articles. Of course, any SDM, no matter how expensive or well tailored, will not develop systems automatically. It is a guideline and will be as effective as the analyst, project leader and EDP manager working with the system.

## EARLY PROJECT DEVELOPMENT

A project can take a few hours or several years to complete. It can be a

new system, an addition to an existing system, a branch or extension of a satellite system or it can be maintenance to one or several operational systems. And it is just as easy to foul up a two hour project. The only difference is the time it will take before someone discovers your mistakes (sometimes referred to as job security).

Every analyst, sometime in his career, has developed a methodology for taking a system from beginning to end. Unfortunately, ten project leaders will analyze, document and implement a specific project ten different ways, with ten different results (sometimes workable) and levels of documentation. However, most poorly developed and documented systems will not be interpretable six months after the project is up and running, unless a total SDM is in place from the start. There is nothing more frustrating than trying to decipher specifications that are incomplete, inaccurate and incomprehensible three months after the lead analyst on the project has left the company. Don't depend on the eternal expertise of the local system's guru. That person won't be available forever, especially in a market with an average annual turnover rate conservatively ranging between seventeen and twenty-five percent. Your best data bank is total documentation, and never mind the excuse that you don't have time to do it right because of external pressures.

If you don't have time to do it right the first time, when are you going to find time to do it over again?

## PROJECT INITIATION DOCUMENT

One of the keys to successful project initiation is the utilization of a formalized Project Initiation (PI) document. When properly completed, the PI document will contain the information necessary to get the project off the ground. It will specify concise information and also have enough facts to give the analyst a basic, comprehensible starting point. If the project initiation was verbal, it should be documented by the analyst (if the user was reluc-

# MULTIFUNCTION BY DESIGN

**Spectra Logic delivers  
single and multifunction  
disk/tape controllers  
for DEC users.**

Now you can improve system performance and reduce system cost with our popular family of DEC compatible disk and tape controllers.

We're Spectra Logic. The company that introduced the multifunction concept back in 1979. And we've been revolutionizing the controller market ever since.

Our multifunction disk/tape controllers provide the high-performance and added value you need to stay competitive. (Compare our \$2,900 SPECTRA 21 OEM price with separate disk and tape controllers.)

They eliminate the cost and need for separate disk and tape controllers, saving CPU slots, increasing reliability, and reducing power and spares requirements.

All of our controllers are smart, firmware-intensive, single board units. They support a wide range of independent disk and tape drives while emulating standard DEC subsystems. And they're backed by the industry's most comprehensive one year warranty.

Interested in single or multifunction controllers? Then contact the company that set the standard in the DEC market. Spectra Logic.

Call or write us today.

## **SPECTRA 12 PDP-11/VAX SMD Disk Controller**

- Emulation of DEC RM02/05 & RK06/07 disk subsystems
- Attaches 4 SMD compatible disk drives
- Features 3 sector disk buffering, 32 bit ECC, overlapped seek support, dual port disk drives & automatic self-test microdiagnostics
- Media compatible with DEC RM02/05

## **SPECTRA 21 PDP-11/VAX Multifunction Disk/Tape Controller**

- Industry's first multifunction disk & tape controller for DEC PDP-11 & VAX computers
- Simultaneous control of 4 SMD disk drives & 8 1/2-inch start/stop or "streaming" tape drives
- Emulation of DEC RM02/05, RK07 disk & TM11, TS11 tape subsystems
- Ideal for Winchester disk backup

# PERSONAL and PROFESSIONAL

## Produced for the Digital Personal and Professional Computer User

Each issue of PERSONAL and PROFESSIONAL is packed with the latest information on the world of personal computers in a high-quality, modern, attractive and easy-to-read format. The finest editors, writers, art directors, illustrators, cartoonists and photographers have been assembled to establish a new level of excellence and objectivity in personal computer magazines.

Simply stated, PERSONAL and PROFESSIONAL is the most substantial source on the Digital personal computer user's regular reading list. It's as if a team of computer experts came to your office or home every issue.

PERSONAL and PROFESSIONAL is an independent magazine, not sponsored or approved by or connected in any way with Digital Equipment Corporation.

I'm going into business.*

# The Graduate™

## IT'S LIKE SENDING YOUR PC TO BUSINESS SCHOOL.

Once you've discovered that your personal computer isn't really educated for business applications beyond a few limited, off-the-shelf software packages, you'll probably want to trade it for a business computer with a lot more power.

And a much bigger price tag. Well, don't.

Because all you really need is the GRADUATE from Unidata.

With the GRADUATE, your PC instantly becomes an intelligent, powerful business computer with a capacity of up to 10 million characters.

But the GRADUATE's *real* power is what it knows: its CAP/CAB\* software called Unisyn.

Unisyn is an advanced business software applications generator that provides professional level CAP/CAB capabil-

ity in a truly user-programmable system.

It means that you can create sophisticated custom programs based on your existing business forms and office procedures—even if you know nothing about computer programming.

The GRADUATE connects to your Apple, IBM PC, DEC Rainbow or other personal via a universal RS 232 C port, so you need no additional, expensive interface. It will work with all CP/M compatible software.

And the cost of the GRADUATE—even added to the original purchase price of your personal computer—is less than that of most small business systems you can buy.

If you think the GRADUATE and your PC belong together, put on your CAP and go to the head of the class.

CIRCLE D236 ON READER CARD

tant to do so) onto the PI form and returned to the user for verification.

**INITIAL USER CONTACT**

Don't believe everything you read, and most important, don't rely on the information on the PI as being totally accurate . . . even if it did originate from the president's office. Communication plays a vital role in the project development process. Many projects have been shelved (or silently destroyed) after countless dollars had been spent, because someone misinterpreted the original project initiation statement and never went back to verify the data.

Once the PI is in your hands, study it, make notes and thoroughly analyze its contents. Prod it, poke it, push it until you feel comfortable with it. Ask yourself who, what, where, why, when and how before you begin the nitty-gritty detail work. Never assume . . . ask.

After you have a handle on the PI statement, rewrite the request in your own words. List your immediate questions and define all known problem areas. Set up an initial meeting with the user to redefine the PI statement, and air out all problems and concerns. Make certain you're both talking the same language.

- Redefine the project's requirements
- List immediate known areas of developmental impact
- Don't assume what you read is what is required
- Poke holes in the PI statement, if you can
- Expand or contract the definition
- Restate the problem in your own words
- Define all grey areas

Involve the users heavily in the project right from the start. This is their system! Use their expertise to gain an insight into their system. Don't rely on hearsay or previous documentation.

- Review everything with the user
- Get initial supporting data from the user
- Get the user's support and approval on the project's direction
- **DO NOT** commit resources at this time

The last item is of extreme importance. A user will try to get the EDP

department to commit resources at a very early date in the project. Ask for time. There is still more work to be done before an educated commitment can be made.

**ESTABLISHING THE PROJECT  
DOCUMENTATION MANUAL**

Once you begin to accumulate data, whether you've generated it or someone else has, you should have a place to put it other than your bottom left hand drawer or some other obscure place.

Documentation organization can be subjective, which is why there is a definite need for establishing a Project Documentation Manual at the onset of the project. Consider a corporation with multiple projects, either in process or completed. With a standardized set of documentation any project member can be transferred to any other project without having to spend weeks (or months) trying to locate pertinent project data. With standardization, everything will be in the same order and format for every project and readily available and current.

The best way to organize a documentation manual is a phase by phase approach. As information is accumulated it is placed in a particular segment of that phase manual, for a specific project. An example of a project manual follows:

**SEGMENT DATA**

- |     |                                     |
|-----|-------------------------------------|
| 1.0 | Copy of the Project Initiation form |
| 1.1 | Project redefinition and statement  |
| 1.2 | Project Impact Statement            |
| 1.3 | Project Benefit Statement           |
| 1.4 | Supporting project data             |
| 1.5 | Phase end report                    |
| 1.6 | Project resource projections        |
| 1.7 | Other pertinent phase data          |

Segments normally required, but not used for a specific project, can be identified by inserting a standardized omission page with the reason for omission, the date and analyst's initials.

The data accumulated for the Impact Phase is normally static, that is, once it is developed and approved it will not change during the remaining life cycle of the project. The entire manual becomes a valuable historical

MICROCOMPUTER SYSTEMS DIVISION

ALWAYS THE FIRST ALTERNATIVE FOR DEC-COMPATIBLE MEMORIES.

# AFFORDABLE HIGH SPEED NON-IMPACT PRINTERS BEING BASED ON ION DEPOSITION TECHNOLOGY

By James W. Rule, Vice President/Marketing, Southern Systems Inc.

DEC users faced with a new range of choice in high speed, non-impact printers, are a case study in the overall revolution occurring in the high speed output demands of the computer industry.

The choice facing DEC users this year will be entwined with the selection and evaluation of technologies, primarily two major contenders, xerography and ion deposition imaging.

Yet the choice need not depend on new criteria; printer versatility, reliability, ease of operation and maintenance cost, and plug compatibility remain the basic considerations.

Data processing managers with DEC processors can pose a series of specific criteria to evaluate printer products, criteria that essentially are based on the standards set by their own experience in using impact technology. For example,

- Multiple font selection. All characters must be of high quality and be comparable to today's letter quality printers. A large catalogue of fonts of varying sizes and formation that can be inter-mixed in the output stream is needed.

- The machine must be easy to use by the operator and not have an intimidating front-panel design. The product must provide excellent print quality.

- The printer should be capable of producing both landscape and portrait orientation output.

- The printer should have the capability of protecting data with sufficient buffer sizes in case of jams. The IO should be structured in a common industry standard, such as the Dataproducts seven-bit parallel interface.

- The printer should have the capabilities of handling 8-1/2x11, 8-1/2x14 and the European A4 size papers.

- The paper handling must be reliable and designed with output face-down for proper report sequencing.

- The paper must be easily removed and have sufficient capacity to avoid constant loading and unloading.

- The unit, like all peripherals, should have diagnostic and error detection circuitry and feed this information back to the user and/or field engineer when required.

- It preferably should be designed to be compatible with all current line printer controllers and made available in an off-line print station for those systems that cannot support the speed.

- It should be a product designed to handle 40 ppm minimum to meet the market segment with the most promising potential.

- The physical size of the machine should be limited as much as possible.

- It should be extremely quiet, less than 55 dba being the goal.

- It should meet all international safety standards and should be produced for the international market with various power requirements kept in mind.

- Optional features should include the capability of doing logos and signatures.

To answer these needs, a totally new technology is essential. One holding enormous potential is ion deposition imaging.

Ion deposition printer systems, using a sophisticated electrical charging process that is simpler and less costly than xerography, hold one of the greatest potentials of satisfying the criteria of the marketplace. Ion deposition technology, in fact, has brought the high speed, non-impact printer market to the threshold of its first major technological shift. To understand what development of ion deposition printer systems means to today's marketplace, it's essential to contrast this technology with xerography and to examine the primary printer functions needed by users.

Today's primary high-speed non-impact technology, laser xerography, is considered by many users to be the major source of non-reliability and the cause of the high cost of non-impact printing. Although this technology — which evolved from copier machine technology — is dominant, it is not answering the primary needs of the major market segments in non-impact printing, especially those needs of the 60 to 100-page per minute user.

Unlike xerography, which evolved from a different area of business equipment, that of copying machines, ion deposition imaging was developed specifically for high speed non-impact printing.

Simplicity is the major quality of ion deposition imaging. Only four steps are required versus the six steps of laser xerography. Ion deposition's inherent advantage is that the image is formed electrically rather than photographically. In addition, ion deposition uses a hardened aluminum rotating drum to create the print impressions, a drum that is inherently rugged. The process also uses mono-component toner, rather than dual, and it eliminates xerography's two separate steps of transferring the image and then fusing it. These two steps are combined into one, a process called transfixing. Transfixing actually cold pressure fuses the toner onto the paper. There is little wear effect on the hardened aluminum drum even during the automatic cleaning process.

The basic concepts, in more detail, are as follows:

## ION DEPOSITION

The technique used to charge the dielectric (aluminum drum) cylinder is the process called Ion Deposition Imaging

# Get into courseware and get a GIGI. Free!

You've considered computer-based education. Now you're ready for it. C.A.S., Digital's Courseware Authoring System, can help you get your feet wet... without getting soaked.

What's more, to the first 100 C.A.S. licensees, we'll give a GIGI™ graphics terminal and monochrome monitor. Free! Just to start them on the right foot.

C.A.S. is designed for VAX. And for you. Use C.A.S. to write your lessons. Use it to deliver them. Use it to monitor and measure results. And use your new GIGI to create effective, sophisticated graphics.

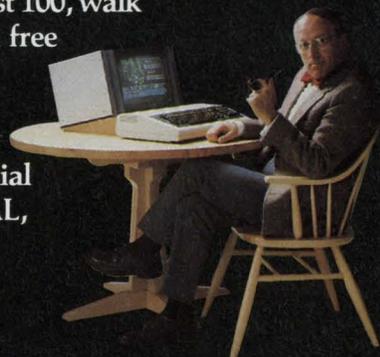

The C.A.S. authoring language is simple to learn, and even simpler to apply. C.A.S. menus direct you step-by-step during lesson development. Other menus guide students easily through your lesson material. A variety of C.A.S. reports keeps you posted on their progress.

Using your GIGI graphics terminal, you can intersperse lesson text with illustrations, including graphs, charts, geometric shapes,

mazes, scenes, forms, objects...in color, shaded and labeled.

Get into computer-based education with C.A.S. For non-profit educational institutions, a C.A.S. license is only \$6000—for all others \$9000. If you're among the fortunate first 100, walk away with a free GIGI and monitor.

For more information, dial 800-DIGITAL, Ext. 420.

## Courseware Authoring System, the wave of the future

GIGI is a Trademark of Digital Equipment Corporation.  
Offer expires June 30, 1983. Prices apply U.S. only.

digital

(IDI). In this process, a cloud of free ions is created in a cavity by means of a high frequency electric field. A second field is used to accelerate a small portion of these ions through an orifice onto a dielectric surface. By controlling either the ion generation field or the accelerating field, the ion 'jet' can be turned on and off as the image cylinder passes under it, creating a series of charged strokes on the dielectric surface of the image cylinder. Using an array of such jets, perpendicular to the motion of the dielectric, a two-dimensional pattern of charges can be created corresponding to the desired image.

The implementation of this process is shown in Figure 1. The pool of free ions is generated by putting a high frequency voltage between the drive line and finger lines at the top of the cavity. A positive bias on the finger will hold the negative ions in the cavity, while a negative bias on the screen attracts the positive ions and discharges them. At the appropriate time, the bias on the finger is made negative, repelling the negative ions, and causing them to follow the electric field through the screen orifice, down to the dielectric.

Either the ion generating field, or the finger bias may be used to control the jet, since both are necessary to the process. The ion cartridge makes use of this characteristic of the process.

Since the images created have a resolution of 240 dots per inch, it is necessary to have 2048 ion jets perpendicular to the direction of travel. If only one of the controlling fields were to be used, it would require 2048 switchable drivers. In the Ion Cartridge, a skewed matrix is used which multiplexes 16 drive lines and 128 fingers, reducing the number of required drivers to 144. IOM electronics time the selection of drive and finger lines to create the strokes appropriately for the image.

### IMAGE GENERATION WITH SKEWED MATRIX

Figure 2 shows a simplified version of the skewed matrix which is used to generate image patterns. The 'E' to be imaged is charged onto the dielectric cylinder as it passes under the matrix in the direction of travel indicated. As a section to be charged passes under each jet, the drive line and finger line for that jet is activated. In practice, each drive line is selected in turn, and the finger line for each jet to be fired for that drive line is selected at the same time.

### TONER APPLICATION

Toner is applied to the charged image by means of the toner subsystem shown in Figure 3. As the charged image on the dielectric makes contact with the toner, a circuit is formed through the toner, which is conductive. The circuit takes away negative charge from the toner particles, leaving a net positive charge. This causes the toner particles to adhere to the charged image as it rotates away from the toner "brush."

The toner is supplied from a reservoir through a slot as shown. The front edge of the slot is used to meter the flow of toner so that a consistent and ample level of toner is maintained on the toner roll. Also, excess toner coming around the roll piles up behind the slot, acting as a valve to prevent too much toner on the roll as it rotates, and provides a precise contact area with the dielectric.

# High quality graphics. \$4460 with hard copy. \$3250 without.

It's hard enough to imagine getting sophisticated graphics at such a low price—let alone getting an integrated printer to go with it. But then again, you've never seen anything like the HP 2623 graphics terminal.

## The display's the thing.

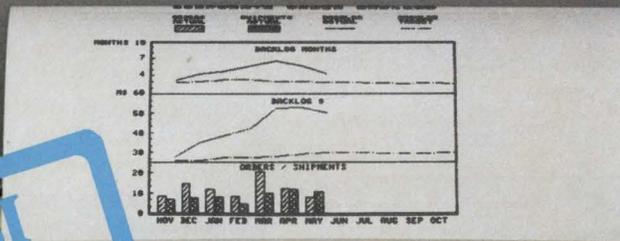

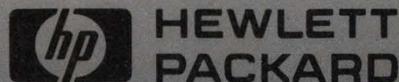

The HP 2623 gives you more than just an extremely sharp screen image. With its advanced graphics features, you can shade different areas of a chart or graph with different patterns, or even draw entire pictures in a matter of seconds.

You can vary the size of the text, rotate it, or make it italic—in any of seven languages. And in addition to HP's DSG/3000 and Graphics/1000-II software, the 2623 runs PLOT 10™ from Tektronix®, SAS/GRAPH™, Precision Visual's DI-3000™ and GRAFMAKER™, ISSCO's DISSPLA® and TELL-A-GRAF®. A remarkable degree of flexibility in a low-cost terminal.

The 2623 has two independent memories—for graphics and alpha- numerics—so you can talk to your computer without disturbing your

graphics display. And if you need hard copy, the thermal printer can dump it out in less than 40 seconds. The HP 2623 works with computers from most major manufacturers. But no matter what system you use it with, HP's worldwide service organization can provide you with the advice, documentation and support you need.

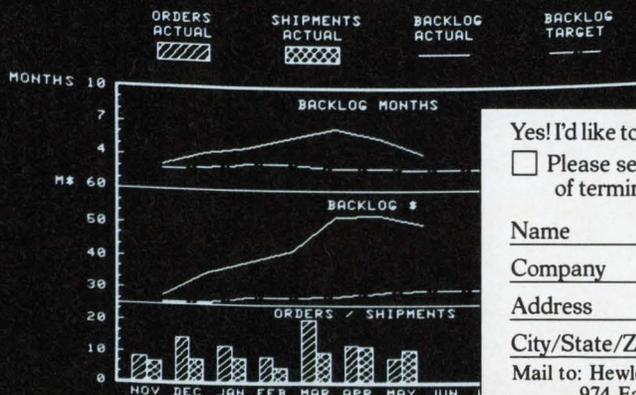

If you'd like to see an eye-opening demonstration, contact your local HP sales office listed in the White Pages. Or just return the coupon.

Prices U.S. list, subject to change without notice.

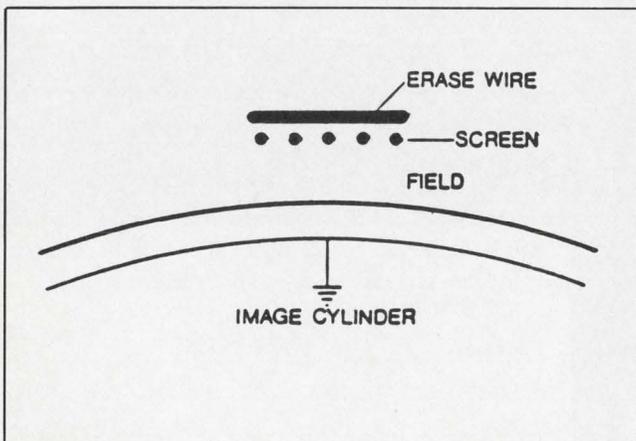

FIGURE 6

## TRANSFER AND FIX

Once toner has been applied to the image, it is transferred to the paper, and fixed in place (transfixed) by a method of cold pressure fusing. (Figure 4) In short, the toner is pressed together with the paper between two rollers, the upper of which is the dielectric cylinder carrying the toned image. The characteristics of the process are such that over 99 percent of it adheres to the paper, rather than the cylinder.

## CLEANING

Since a small amount of toner is left on the cylinder, as well as some residual charge, two processes prepare the dielectric surface for further imaging. The first scrapes off any remaining toner, the second restores the surface to ground potential.

The scraper blade (Figure 5) is a steel blade held to the surface of the cylinder by spring tension. The surface of the cylinder is very hard compared to the blade, and quickly hones it to a near-perfect fit to scrape off any toner particles left clinging to the surface. These are caught by the catch-tray below. The blade also takes off paper dust which may have transferred to the cylinder from the paper.

The erase head (Figure 6) is an element which restores the dielectric surface to ground potential before imaging. It consists of an insulated wire behind a conductive screen. The screen is kept at ground potential while an RF signal is applied to the wire. This creates a pool of ions which can be attracted by any charge remaining on the dielectric surface, leaving it electrically discharged and ready for the next image.

The most exciting benefit in the utilization of ion deposition imaging is its inherent capability to reduce the cost of ownership of products utilizing it. It is readily apparent that the maintenance cost should be much less because of the inherent increase in reliability over laser xerography products. The mean time between failures or copies before failure should increase considerably; estimates indicate reliability increases four-fold. Due to ion deposition simplicity, the mean time to repair will be reduced substantially. The end result should be a total cost per sheet reduction of about 50 percent.

Due to these and other characteristics of ion deposition technology, products such as the Mercurion 1 being marketed during first quarter 1983 by Southern Systems Inc. of Fort Lauderdale, FL, should have a dramatic effect on the printer marketplace, answering for the first time the market requirements at an affordable price, approximately \$60,000, including total interface for the majority of the computers on the market today as well as being software compatible with existing line printers.

Users can look forward to ion deposition-based products, using cutsheet feed, yet replacing directly today's line and letter quality printers — without software changes — and emulate those line printers exactly.

The dramatic effect of ion deposition is destined to trigger a major shift in printer technology that will dominate the high speed, hard-copy output market through the end of the century.

# SAS, Not Just for IBM

## ...Anymore

Since its beginnings, SAS® has provided a powerful and flexible software system to IBM users. Now SAS offers VAX™, ECLIPSE® and PRIME® users the same power and flexibility.

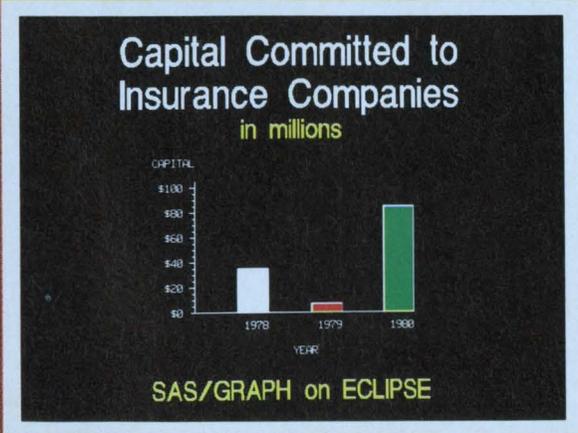

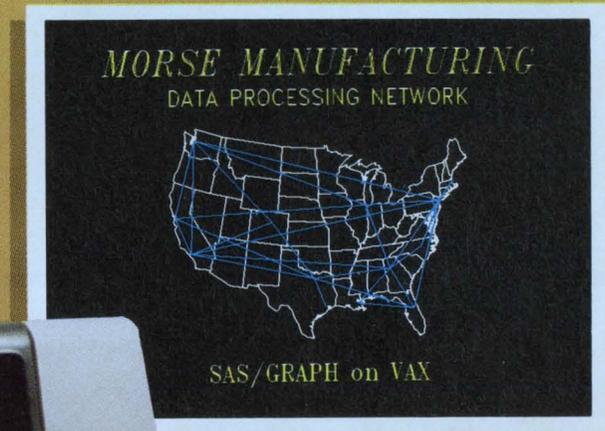

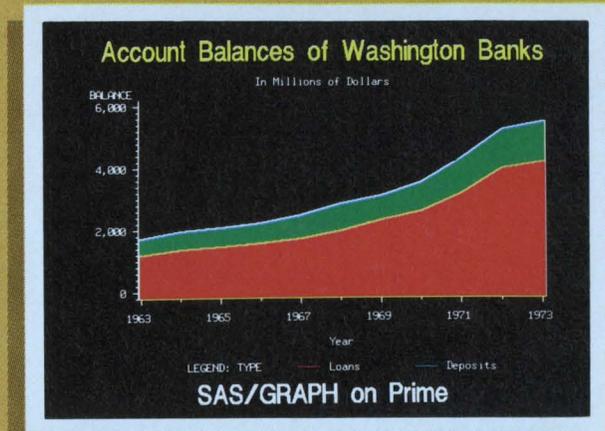

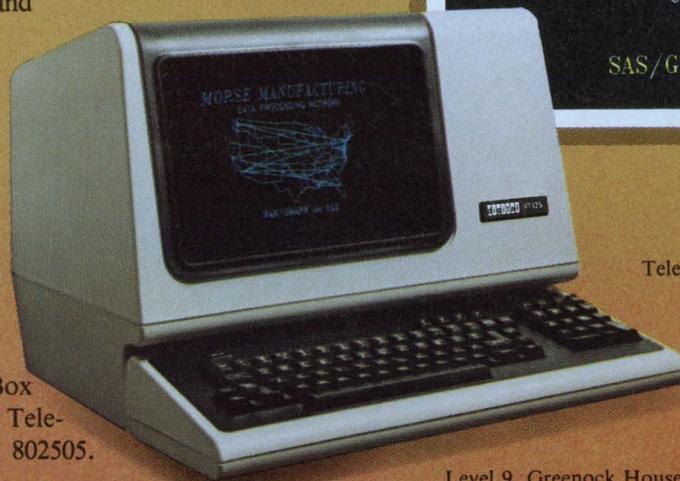

You get a twofold advantage with the SAS System. A library of ready-to-use procedures gives you the power to analyze data without formal training. SAS even provides an on-line help facility. With a few English-like commands, you can use SAS for data analysis, market research, capacity planning, financial reports, summary statistics, charts, plots, personnel reports and many other jobs.

In addition to these routine reports, the SAS System provides extensive data management and retrieval tools, combined with a macro facility, to handle all your complicated programming needs.

In short the SAS System gives you the analytical tools for a complete Decision Support System, integrating SAS for data management, statistical analysis and report writing; SAS/GRAPH™ for color graphics; SAS/ETS™ for econometric and financial modeling, and forecasting; and SAS/FSP™ for data entry, letter writing and financial spreadsheet reporting.

Now you can enjoy the power and flexibility of mainframe software on a minicomputer— with SAS.

## FROM THE RSX EDITOR

By James A. McGlinchey

Allow me to introduce myself. I've joined The DEC\* Professional as the Editor of the RSX Department. Many of you may be familiar with my name through my participation at the DECUS Symposia; others of you have possibly seen my name as author of several articles which have already appeared in The DEC\* Professional.

For those of you who haven't the foggiest idea who I am, let me list those items in my not-so-illustrious past which are pertinent to the position I now hold. I have been in the Data Processing trades for thirteen years, the most recent six of which have been spent as a user, system programmer, and consultant in the RSX-11M world. I currently teach the DEC Seminar, "Design of Applications under RSX-11M." I have been an independent consultant for the past three years, being primarily interested in industrial automation using PDP-11's and major microprocessors.

I view my position at The DEC\* Professional as one of being responsible for acquiring, editing, and writing articles of interest to the users of RSX in all its versions. In that capacity I have considerable freedom to choose from the available articles and to solicit articles from proven authors. Such choices reflect not only my understanding of my new position but also the purpose of The DEC\* Professional Magazine.

The articles I am looking to publish basically address the question of WHY a programmer or designer uses RSX in a certain way. The WHAT has generally been answered satisfactorily in that Digital has written a comprehensive manual set for the RSX family of Operating Systems. The users always have difficulty, though, in deciding what facilities to use out of the large complicated set of functions available.

Other articles which would be of interest would include:

Migrations to or away from one of the RSX Operating Systems, such as RT to RSX, RSX-11M to RSX-11M-PLUS, RSX-11M to VMS, UNIX to RSX - any likely combination.

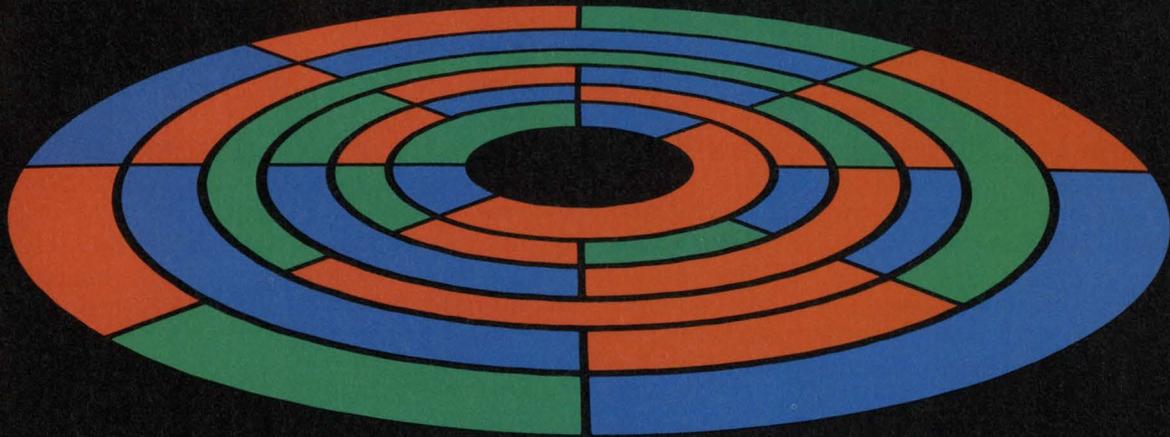

Design Trade-Offs - Do it this way rather than that way, and why.

Expansions of items in the manual, mentioning GOTCHAS, explaining which facets of an RSX facility are useful, which are troublesome, and why.

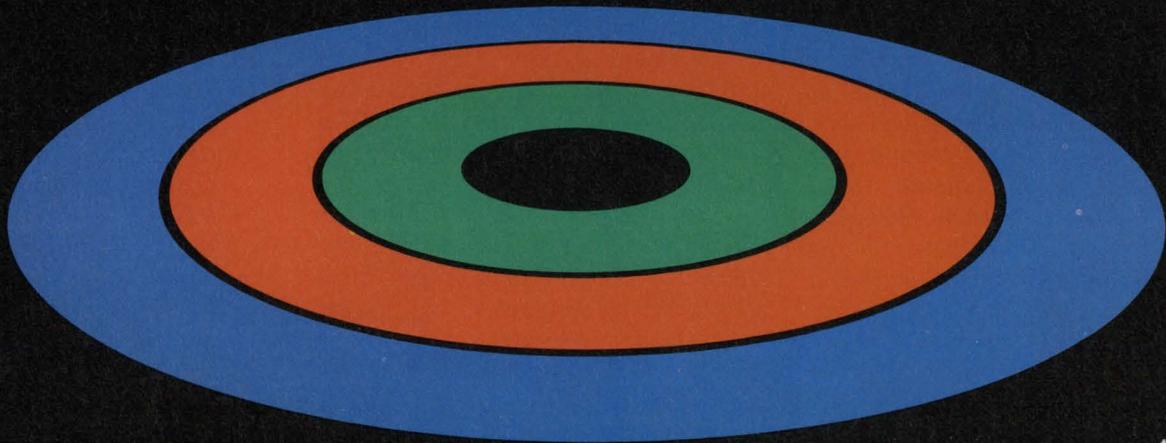

Practical jokes - So you found out how to rotate the LEDs on a VT100, huh? - are a personal favorite. Please indulge me.

1

# WHAT YOU DON'T KNOW ABOUT RSTS/E DISKS IS COSTING YOU MONEY

If your disk looks like this, you're wasting system performance.

If your disk looks like this, you're using DISKIT.

When the job you're running requires reading the "red" file, it naturally happens faster on a well-ordered disk. Disks become "fragmented" as you use your computer. The system slows down. And that costs you money.

Now, you can restructure your disks and get back that lost performance (up to 50%) without spending a dime on new hardware. DISKIT is the original software system that makes this possible.

But don't confuse DISKIT with other system utilities, DISKIT is a complete "software tool kit" that optimizes your RSTS/E system.

DISKIT is:

- DSU — The utility which restructures the information on your disk, making data fast and easy to access.
- DIR — The incredible directory tool that finds files at the rate of 400 per second.
- RDR — Reorders disk directories 30 times faster than ever before possible.
- OPEN — Displays complete job statistics and file activity so you can see what your system is doing.
- DUS — The set of CALLable subroutines which pre-extend file directories, reducing fragmentation.

In today's tight economy, it's more important than ever to get the most out of your hardware investment. Call or write today and start getting your money's worth from your computer.

## **STRETCHING THE CANVAS IMPACT ANALYSIS . . . continued from page 18**

tool for post-project evaluation and will be used for future project planning and resource projections for similar projects.

### **THE PROJECT IMPACT STATEMENT**

A project is initiated because someone needs or wants something. Many times the users can't determine the total impact their requests will have on corporate resources, because they are unfamiliar with the day to day idiosyncracies of the EDP world. Most users don't know a bit from a byte and many don't concern themselves with it. Their primary concern is bottom line; how much is it going to cost and when will it be implemented.

On the other hand, some users can't distinguish between a need and a want. A user may need a vehicle to travel between points 'A' and 'B'. A bicycle may perform this function adequately, but the user wants a Concorde because the competition has one.

The initial impact statement may discourage this extravagant want before the project develops. However, various system alternatives will be analyzed in depth and cost justified in the next phase, the Feasibility Phase.

The purpose of the impact statement is to arrive at an overall feel for total project resource commitment. The project cost and resource estimates arrived at in this phase are 'ball park' figures and can change radically as the project develops. It is always at the discretion of management to cancel or delay a project at any point in its cycle, because of a change in corporate needs, status or resource allocation, regardless of previous commitments.

The analyst assigned to the project should be experienced and hopefully familiar with corporate resources available, skill levels of team members, hardware and software options, the present systems configurations and the overall constraints and restraints of the operational system in general. This knowledge will enable the analyst to make an intelligent 'educated guess' for the initial resource projections and allocations.

Once this knowledge is put into place, the project tasks can be identified. A detailed task analysis will be made during a later phase in the project.

First, identify the number of phases that will be associated with the project. Smaller projects may combine phases and resources. Very small projects may be one phase. Next, develop a general task list for each phase. For example, the Impact Phase may require the services of one analyst for one week. The Design Phase, on the other hand, may require two analysts and three programmers, performing two hundred and fifty tasks. Remember, these early projections are guesstimates, based on previous project knowledge and past experiences with corporate hardware and software configurations. The user should be made aware of this early in the phase.

Use a standardized task list to project resource allocation. The tasks can be self generated or generated by the aid of a computerized Project Management System (PMS). A computerized PMS can automatically generate task lists, allocate available resources and project time and cost estimates as required. There are several excellent vendor Project Management Systems available in the \$8,000 to \$80,000 price range. Three of the better systems on the market average about \$40,000.

In either case, initial resource allocation should be established to determine the overall project cost and time projections. Once resources are identified, the dollar projections can be arrived at by utilizing a standardized 'plug-in' cost factor. This should include hourly salary plus overhead.

The Impact Statement will contain a summary of your projections for the entire project.

- Identify the phases associated with the project
- Specify the general tasks to be performed by phase
- Develop an overall task list by phase
- Develop a GANTT or similar projection chart
- Produce a total cost and schedule projection by phase
- Write the Impact Statement

Don't forget to include time for meetings, phone calls, writing specifications and revisions (there will always be revisions). If a conversion of data will be required, include this as a separate phase projection.

At the end of the Impact projections, the analyst will have developed:

- A firm cost for the Impact Phase
- An educated estimate for the Feasibility Phase
- A guesstimate projection for the remaining phases

### **THE BENEFIT STATEMENT**

The Benefit Statement is developed to offset the shock of the Impact Statement. This is not a formal Cost/Benefit Analysis. It is a general listing of the projected benefits of the new system. A formal Cost/Benefit analysis will be performed during the Feasibility Phase.

Benefits fall neatly into two categories; tangible benefits and intangible benefits. Tangible benefits are those benefits that can be measured directly. Basic areas of tangible benefits are:

- Elimination of office machinery, postage, stationery, etc.
- Reduction of costs due to improved procedures
- Increase in money accruing as a result of a feature of the new system
- Reduction of personnel

The tangible benefits are easily calculated or are measureable. Intangible benefits are desirable effects which are difficult to measure in direct monetary terms. In other words, a simple benefit may be a standardization of corporate procedures, which leads to a series of increased skill proficiencies or overall improved efficiency of corporate personnel. These benefits can be classified into many categories. A partial list follows:

- Information availability
- Reduced tedium
- Corporate image
- Data Reliability
- Performance measurability
- Improved forecasting
- Improved accuracy
- Speedier results
- Improved customer service
- Responsive data analysis
- Improved data control
- Improved personnel control

The combination of tangible and intangible benefits is usually sufficient to overcome any costs or inconveniences that will be incurred during the project's development life cycle.

## ***CIE TERMINALS***

CIE Terminals, Inc., is video display and graphics terminals, line printers and ACRO Corporation all rolled into one new company of C. ITOH ELECTRONICS, INC.

New headquarters and Southern California sales office: 2505 McCabe Way, Irvine, CA 92713-6297. (714) 660-1421. Or call toll-free, 1 800 854-3322.  
Other regional sales offices: San Jose, CA (408) 977-1146; Cherry Hill, NJ (609) 983-5075; Chicago, Ill (312) 992-2346; Houston, TX (713) 777-1640; Atlanta, GA (404) 257-1814; Denmark (02) 921100.

© CIE TERMINALS, INC., 1983  
CIRCLE D196 ON READER CARD

However, some projects may show a considerable loss at first, or may never show a projected return on investment, due to a crisis situation or federal law, etc. that must be implemented to survive.

The Benefit Statement task list should include the following steps:

- Analyze and weigh all benefits
- Project tangible and intangible benefits
- Weigh the benefits against the impact
- Write the benefit statement

**IMPACT PHASE USER REVIEW**

Usually the Impact Phase review is not a formal review per se. The phase end report should be neatly typed and presented to the user in a business like fashion. But in general, it is a statement to the user on the future status of the project. It is a projected commitment of corporate resources for a given time frame. It tells the user what total impact can be expected and what benefits can be derived. If total commitments are too far out of line, the user may opt to cancel or postpone the project for an indefinite period of time, or when corporate resources may be more readily available.

If the user decides to go ahead with the project, a formal corporate level review is normally made of the request and its associated impact/benefit analysis.

**PROJECT PRIORITY**

Everyone wants his project done

yesterday. If we didn't we wouldn't be human. Most corporations have assembled a group of knowledgeable individuals, with vast corporate and/or data processing backgrounds, to review new project requests. These individuals determine project priority, that is, which projects will receive most of the available resources and which projects will be shelved or cancelled. The group is usually called a User Review Group, Steering Committee, Control Committee or other such applicable name. Their main function is to review the status of new and existing projects to determine where they should be placed on the ladder of corporate EDP priorities.

Some decisions are relatively simple to make. If a project is initiated based on a federal, state, county or local regulation, the priority is generally set based on the required implementation date.

Other priorities are not as cut and dry. Several objective and subjective factors are generally taken into consideration. A project initiated by the Chairman of the Board will surely carry more weight than one generated by an insignificant department manager.

However, all other factors being equal, the impact and benefits the project will have on the total corporate assets will generally aid in project placement on one of the priority rungs. This is where the analyst's or project leader's initial evaluation and analysis of a project can lay a convincing role in helping the committee to prioritize

the project.

**PHASE SUMMARY**

At the end of the phase, management will have the data necessary to make an intelligent decision as to the disposition of the project based on your Impact/Benefit Statement and projections for total corporate resource allocation.

Make certain you are comfortable with the time frame established in your projections. Don't try to be a hero. Estimates that are too critical will cause the project to shift from first gear directly into a crisis mode. Once in the crisis mode, there is no reverse!

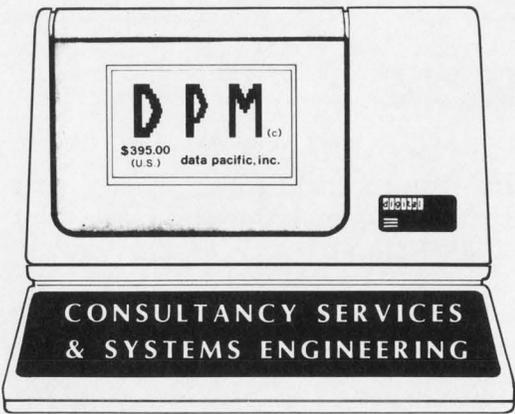

The Impact/Benefit Phase, is in effect, the first step in painting the Mona Lisa. It would be inconceivable for Leo to have begun his painting without first preparing the canvas. In reality, the Impact/Benefit Phase is stretching the canvas. Once this is in place, the artist can sketch his product.

The total SDM is a tool and is not intended to hamper the creative abilities of the analyst, programmer or project leader.

Instead, it provides a direction to travel when developing the systems. It is a guide for solving complex systems problems. It helps the analyst through the web of questions, problems and alternatives that blanket a project's development life cycle.

Future articles will take the project from the Feasibility Phase through the post-project evaluation of the implemented system.

# Test your word processing I.Q.

PDP-11, VAX,  
68,000, 8088

And discover how the advanced features of LEX-11™ can increase your w-p capabilities.

## THE CHALLENGE:

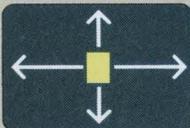

Almost any word processing software package will have such features as menus, editing, spelling error detection, list processing, cut and paste, automatic word wrap and automatic pagination. . .

. . . But can you tell the difference between run-of-the-mill software and a system that is really special?

EEC SYSTEMS offers you this challenge! Test your word processing I.Q.

## THE QUESTIONS:

### 1 EDITING

Which kind of editing operation is quickest to execute and easiest on the eyes of the word processing user?

- Full screen editing allowing for easy cursor movement around the screen?
- Moving the cursor around by doing a line count?
- Editing on the bottom line of text only?

### 2 DOCUMENT LAYOUT

Whatever document format you choose. . . you want to see what the finished article will look like. Should you. . .

- View it on the screen as it would come out of the printer?
- Run it through a pre-processor to see what it looks like and then if you like it, print it?

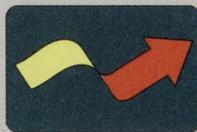

### 3 KEYSTROKES

Using a well designed w-p system, how many keystrokes should it take to execute the most often used w-p functions?

- One easy stroke with no codes?
- Two or more with complex w-p codes?
- Three or more?

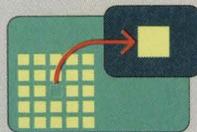

### 4 FLEXIBILITY

As the business manager of your company, you would like to find w-p software that you can tailor to your company's specific needs. Should you. . .

- Look for w-p software that allows you to change and add menus, and change function keys?
- Write your own custom software?

### 5 RETRIEVAL

If you want to retrieve information quickly from a large database, which w-p software should you choose?

- One that can access a particular record by going to it directly?
- One that searches through all the records on the database sequentially until it finds the right one?

### 6 COMPATIBILITY

As a manager of MIS, you want a w-p system that can be integrated with other application software. Should you choose w-p software with. . .

- ASCII formatted files?
- Software which requires non-printing characters in it's file system?

### 7 MATH

Your company has a number of financial applications and is looking for a w-p package with math capabilities. Should you choose. . .

- On screen calculating allowing for editing, storing and recall of equations, calculations integrated with your word processing applications?
- Software where the math capabilities are tied to the list processing module?
- A separate math package?

## THE ANSWERS:

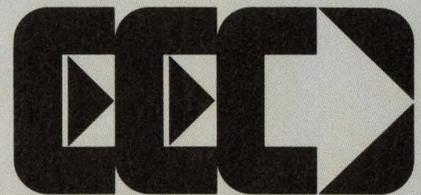

If you answered "a" to all of the questions above, go to the top of the class. Chances are that you already use LEX-11 or are about to buy it. You know that LEX-11 is the **ONLY** word processing software that combines these advanced features. . . and more. . . in one software package.

## PUT OUR SOFTWARE TO THE TEST

Call for a demonstration by modem in your office today.

# Voyager™ I from Tymshare

## Your FUTURE Is NOW!

See Us At Booth G  
DEXPO EAST St. Louis

The future has a way of becoming the present. Tymshare has made the future NOW, in announcing the first in a family of DEC\* compatible disk subsystems.

Tymshare Voyager Series disk subsystems offer the DEC computer user, increased disk storage capacity, reduced space and power requirements and attractive pricing alternatives.

Have you evaluated your present disk subsystem costs?

When it comes to experience and reputation Tymshare is second to none. When it comes to Price/Performance and Mixed Vendor Support, Tymshare is one step beyond...

# UPGRADE PATH FOR H11 [AND LSI-11]

By Ed Judge, Fairbrother Associates, Box 685, Northampton, MA 01061

Many of us who wanted to get into electronics and/or computers in the old days must remember looking at the Heath catalog and wishing for this or that. For me, this or that was their analog computer, and later their H11, a kit version of the LSI-11.

Many must remember when the H11 came. Putting together the power supply and trying to assemble those plastic connectors on the back, maybe running a switch so you could control your line-time clock from the outside of the case. Wondering why they didn't use DB25 connectors, and why they didn't put the line-time clock switch on the front panel, as they finally did on the later models. And, of course, the big one: why did they drop the line, and how could they leave so many loyal customers holding a very expensive bag? Oh well, life goes on, and what can you do about it?

After you've thought about it for a while, you can do either of two (legal) things:

(1) — You can try to sell the unit for whatever you can get and buy another brand that stands behind its product, or

(2) — keep the unit and hope for better things.

I opted for the second, and as no one was really trying to support the the H11, I looked further, and found many people supporting the DEC PDP-11/03. Fairbrother Associates was formed to bring some of the fantastic 11/03 support to people with Heath equipment (and hopefully, to make some money to pay for some nifty new equipment). We attempt to be aware of what's going on in the less expensive end of gear for the H11/PDP-11/03/23, and share this with our customers.

Over the last year, we have had many customers, and have learned many things, both good and bad, about the future of the H11 system. One of the most important things learned is how to go about upgrading the H11 while keeping as much of the old system as possible. Much thought and ac-

tion has been expended on this subject, and I feel that many people who own H11's would be interested in what has been learned. Another reason is that for the most part, the people who bought the H11 were planning to use it in a serious manner, not just to play games. Many were willing to upgrade the H11 and use it for their businesses, if an affordable way could be found to do it. We felt that "affordable" meant using as much of the old Heath equipment as possible, and maximizing the utility gained from the new equipment.

Basics first, for those who "... walk the walk..." but haven't, as yet, learned how to "... talk the talk..."

The H11 is Heath's version of the Digital Equipment Company's (hereafter referred to as DEC) PDP-11/03 (Programmable Data Processor, type 11, model 3) computer. It was the first single-board computer with the PDP-11 instruction set. It was applauded as the first big step to get the computer into the hands of the people, as it offered 16-bit word length, the standard PDP-11 instruction set, and a lot of computer power for its relatively low price. It also offered a crude (at the time) but "user-friendly" (some cynics insist on using "idiot-proof," but they usually consider themselves an elite group of one or two people) operating system called RT-11, the "RT" standing for "Real-Time."

The ease of use of this operating system has directly contributed to the popularity of the CPU. With V3 coming out in 1977, and V4 coming out in 1980, 11/03 users had one of the best single user O/S available to any small computer user. And with TSX and TSX-Plus, timesharing came almost painlessly to RT11. V5 is scheduled for release this May. We'll see.

An important thing to note: even if you purchased the CPU from Heath, you are still entitled to the same privileges as any person who got it from DEC. This means you can use the LSI Hotline (call DEC in Marlboro at 617-467-5111 and ask for the number,

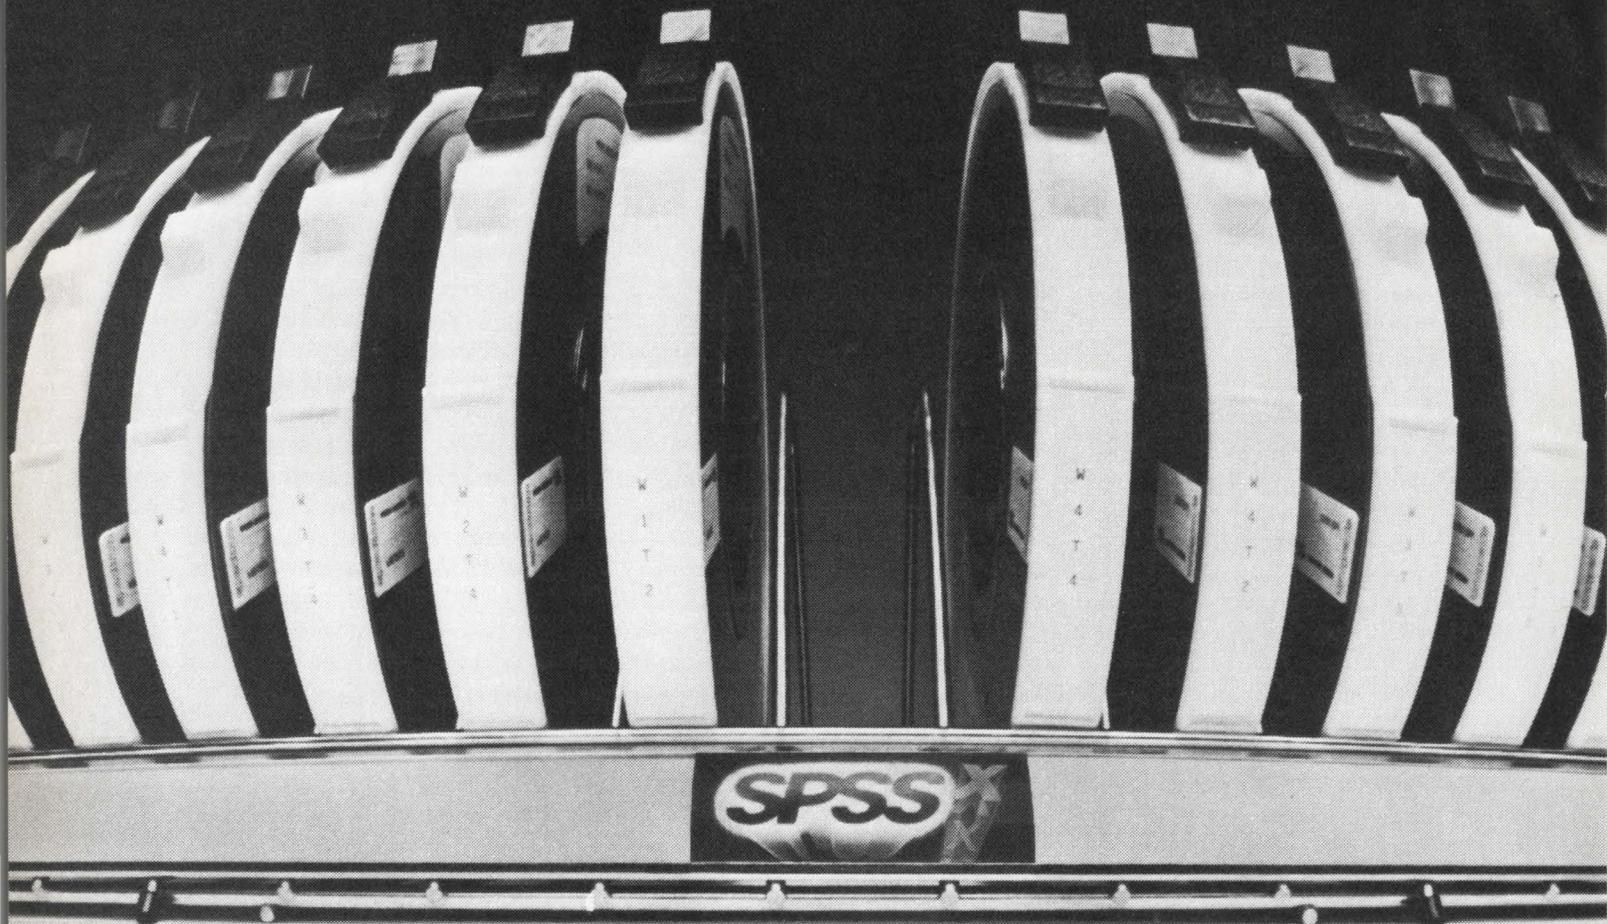

for out of state it may be toll-free) and join the several Special Interest Groups. I recommend you join the RT11, LSI, and perhaps the Structured Languages SIGs. Call and ask what you must do to join. Don't miss out on this, as DECUS (Digital Equipment Company Users Group, One Iron Way, Marlboro, MA 01752) is a very valuable asset. They hold big (I mean BIG) meetings every six months or so that are interesting to attend. You can make many useful acquaintances there.

Upon examination, the "other" OP/SYS, CP/M, is a poor vision of RT11. The CP/M file system is very similar. In fact, it is rather easy to read CP/M discs on an RT11 machine. A program to do it is in the public domain. There is also UNIX and its limitations, which work well when most of the bugs are removed, whenever that is. Some people think UNIX is great. There are a whole bunch of people with 8-bit machines running CP/M and thinking its the best OP/SYS going, until they see RT11, with all the things they have dreamed of having, and many they never even thought of.

RT11, with its English-like command language (user expandable in V5), is much easier to use initially, much more powerful. Its device-handling structure makes it very easy to maintain, add, and change configurations. With active input from the User's group and Special Interest Groups sponsored by DEC, the development path is usually along the lines of what the majority of the users want. As proof, the much proposed idea of putting FORTRAN IV+, the optimized version of DEC's FORTRAN IV, on RT11 is finally happening. Wish lists from the users finally prevailed. Of course, DEC stands to make a little money on the deal. A long awaited new BASIC is also rumored to be coming out "soon," with long variable names, compound conditionals, etc. Finally!

All of this implies the first upgrade path for those who wish to do more than just play with their H11's—get RT V4. Various ways of ob-

# MEET THE INFORMATION ANALYSIS SYSTEM THAT WON'T JUST SIT ON THE SHELF.

Some software systems are like bookends; they spend most of their time gathering dust. But not SPSSX.<sup>™</sup> Because it offers everything you need to organize, summarize and display volumes of information in scores of useful ways. A totally new software product which we've designed with the most advanced capabilities yet. To bring you the hardest working Information Analysis System you can get.

**Need help managing complex files?** SPSSX lets you read and define almost any file, regardless of complexity or structure. It even tells you when records are out-of-sequence or missing.

**Searching for sophisticated statistics?** With its basic and advanced statistical capabilities, SPSSX allows you to extract meaning from masses of information with greater ease than ever. You can choose among a wide variety of procedures. From simple plots and tables to complex multivariate analyses.

**Want to write presentation-ready reports?** With the system's built-in Report Writer, you can manipulate complex records containing long strings of characters, perform basic statistics, and print out a

custom-formatted report—all in one easy, automatic step! Then use our device-independent Color Graphics Option to produce professional graphs, charts and displays.

Yet for all its sophistication, SPSSX is remarkably simple to use. With minimal training, even inexperienced users can quickly obtain the vital information they're after. Which means they'll spend less time inputting problems, and more time focusing on solutions.

If you're ready for a software system that'll do much more than sit on your shelf, call or write for our descriptive brochure today.

© Copyright 1983, SPSS Inc.

**PRODUCTIVITY  
RAISED TO  
THE HIGHEST POWER<sup>™</sup>**

SPSS Inc. 444 N. Michigan Ave. Chicago, Illinois 60611 (312) 329-2400

SPSSX currently runs on IBM OS, CMS and Digital VAX<sup>™</sup> systems. Conversions will soon be available for IBM DOS, DEC 10 and 20, PRIME, Univac 1100, Data General MV 8000 series and other minis and mainframes.

taining this should occur immediately to the aficionado, but know that there are many different licenses available. Some, with run-time utilities, cost a few hundred dollars.

Many universities run DEC machines, most with RT11 somewhere. Go there! Make friends! Use the new RT (or even the old V3)! See if it isn't all I've said!

These universities may also sell the RT11 manuals very cheaply to their students (oddly enough, they look a lot like you) because of some special license deal that DEC gives to them, probably to hook them early on RT, so they won't feel comfortable working with less. Less is just about anything else.

HT11 is a very buggered-up version of RT11 V2C. Heath has put some routines in the code that make it almost useless if one wishes to get more out of the 11. Much of the public domain software that is available won't even run under HT11. Again, this is the first step, but once done, the world opens up to you.

As a side note, inquiries have been made to Heath about getting this code when they stop supporting the H11, but no response has been forthcoming. It isn't even known (by anyone outside Heath) how many H11 owners there are, although I've heard that the contract Heath and DEC entered was worth about \$5 million dollars. Attempts to get a list of customers have also met with complete failure.

Moving right along, once RT11 V4 is obtained, you should then look at the system software available for the 11. First, there is FORTRAN. Old and as full of bad ideas as it is, it still is one of the best languages available for the 11, as the 11 architecture is nicely adapted to running FORTRAN, and FAST! There are several preprocessors such as RATOR, FLECS, and SFTRAN, which allow full structured constructs such as DO-WHILE, REPEAT-UNTIL, IF-THEN-ELSE, CASE, and others. These give you the convenience and ease of programming that these constructs allow, and the speed, portability, and compactness-of-code that most FORTRAN compilers have after millions of man-hours of development. This is a very important feature that you should not let any "language snobbery" take from you. FORTRAN 77 is supposed to be

available with V5, which will be a blessing for those who have fought and waited so long for it.

As for portability, if the program doesn't have any system dependent extensions, it will most likely compile as it stands. I took a sort program from a Harris computer and compiled it without error on my 11-23. Not bad for a language that is so belittled by many people.

There are many other languages available, such as \*PASCAL, COBOL, BASIC, \*FOCAL, \*C, \*LISP, \*FORTH,

\*APL, DIBOL, DBL, DYNAMO, \*ALGOL, MUMPS, MUDDLE, CORAL, BLISS, \*MODULA-2, . . . You get the idea, LOTS. Many languages were developed on the PDP-11, and some of these (\*) are available in the public domain. Most of them are available from DECUS (Digital Equipment Company Users Group) or from other organizations and individuals, such as Fairbrother Associates. Excellent time-sharing systems are available to further enhance the unit's utility.

Next, you must give consideration

## Software Tools for RSTS/E

**Evans Griffiths & Hart, Inc., a pioneer in the development of RSTS and the winner of an ICP million dollar award for KDSS and TAM, offers packages that save you time and improve your productivity.**

- **KDSS**, a complete multi-terminal key-to-disk data entry subsystem. Eliminates the need for keypunching and stand-alone key-to-disk systems. (Also available for VAX/VMS and RSX-11M.)
- **TAM**, an efficient multi-terminal screen-handling facility that provides complete support for the development of transaction-processing applications on a wide variety of terminals. (Also available for VAX/VMS and RSX-11M.)
- **FSORT3**, a very fast sort/merge package for RMS and non-RMS files. More economical of disk space than SORT-11 and much faster.
- **SELECT**, a convenient, very fast package for scanning files to extract records that meet user-specified selection criteria. Use as part of an online inquiry system and as a front end for building file indices and generating reports. SELECT and FSORT3 can save hours in nightly batch runs.
- **BSC/DV**, a RSTS/E device driver for the DEC DV11 synchronous multiplexer. Suitable for handling a wide variety of bisynchronous protocols. (Also available for VAX/VMS.)
- **COLINK**, a convenient, efficient link between two RSTS/E systems using DMC11s or DMR11s without the overhead of DECnet. Supports file transfers, virtual terminals, and across-the-link task communication.
- **DIALUP**, a comprehensive, efficient link between RSTS/E and other systems using asynchronous terminal lines. Supports file transfers, virtual terminals, auto-dialing, and the use of command files and macros. The premier RSTS/E package for remote support and reliable, CPU-efficient file transfers.

DEC, DECnet, RSTS, RSX, VAX, and VMS are trademarks of Digital Equipment Corporation.

CIRCLE D65 ON READER CARD

to how far you want to go in getting peripherals for the 11. There is a stunning amount of equipment that will fit on an 11. The design criteria was maximum flexibility and minimum complexity. One can go from the stock system with 11/03, 64KB, SS/SD (Single-Sided/Single-Density) 8" floppies, and serial or parallel ports, up to almost any configuration desired.

Adding a new peripheral is in most cases a matter of inserting the controller and putting the requisite system handler on the system disc. With a new 22-bit backplane, one can get an 11/23 with floating point and up to 4 MB's of memory. Boards are more expensive than the 8-bit machines, but not as expensive as UNIBUS boards, is the standard 16-bit bus structure DEC normally uses.

All Heath boards for the H11 are not usable as they stand. The serial board in particular needs some attention, as one of the lines is not terminated. It works erratically, depending on its position in the backplane relative to the other boards. I plan to write an article for the Heath Users Group newsletter, REMark, explaining what can be done to fix the situation. It requires a few pieces of wire and two resistors.

Now for some concrete examples on expanding a stock system to maximize the return of your money in terms of utility offered per dollar spent. The following path is what Fairbrother Associates recommends to its customers.

The first thing we think should be done is to upgrade storage. Our MXV-21 controller costs \$995.00 (with cable). With it you get double-density right away, and the controller is a DMA (Direct Memory Access), and is much faster in reading and writing to the floppy or to memory. Double density gives you about 960 blocks (depends on how many directory segments you want), and the ability to run programs without the messy problem of switching to another disc to compile, and another one to link, etc. The newer version of RT.11 is always bigger than the previous version. The added storage space is necessary for V3 and later versions. With no other upgrades, the functionality of the system has been expanded considerably, with a minimum investment. But there is more!

Our controller offers two features that Heath's (or DEC's, for that matter)

controller doesn't. First, if you want to upgrade one or both of your original Heath Memorex floppies to a double sided model (we recommend Mitsubishi or Qume DATRAK-8; NEC FD1160's are nice, but are slower and cannot have a write protect switch installed), all you have to do is unplug and unscrew the old drive and replace it with the new one. Depending on the make and model, a few holes may have to be redrilled, and a little sheet metal may have to be filed here and there, but nothing bad. An adapter to couple the SS AC power plug to the DS type is also needed. The options on the drive will have to be set correctly, but then all you do is use double-sided discs for a storage capacity of 1.2 MB, which is about 1964 blocks. Two of them store as much as was stored on the old RK05-J hard disc, but are slower.

You can do a lot with that much storage. I know several people who find this to be enough for professional use of the 11. If you replace both drives with newer models, you can get another timing prom to get full speed out of the drives for about \$15.00. The new drives are about twice as fast as the original Heath Memorex drives.

The second feature involves memory. If you wish, you can have up to 256KB of memory in the backplane. The 11/03 processor can only address 64KB of memory with 16 address bits. The backplane, a full Q-BUS (what DEC calls the backplane organization), has 18 address lines (newer models of the Q-BUS have 22 address lines), so you can manipulate the extra two address lines to get an additional 192 KB of memory. With our controller, we include a file to activate the two additional lines and use the upper memory as an "electronic floppy disc." This is done in a transparent manner by calling "DY7:" in a program. When the handler sees this, it goes to its routine of handling the upper memory in the same manner it controls the floppy drive. With more memory, you can run TSX, and put the swapping area in the memory above 60KB.

An important point to notice is that everything purchased so far is usable when you decide to get an 11/23. The 256 KB board has 22-bit addressing lines, and can be used in full house timesharing systems with 4MB of memory. The controller is 18-bit, but

when 22-bit floppy protocol becomes standardized for the Q-Bus, we hope to have a handler to access the memory above 256 KB as "DY7:" also.

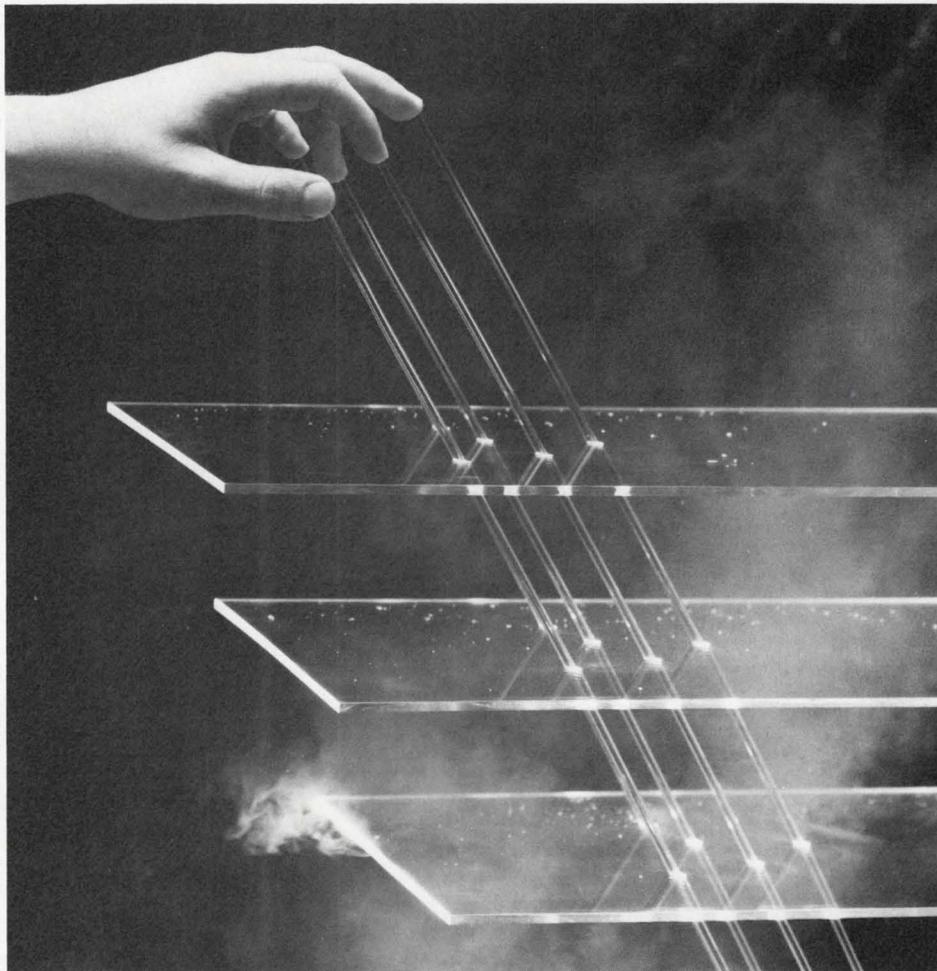

An 11-23 with MMU, 256 KB of memory, and TSX-Plus will give you timesharing RT11, marking the start of an upgrade path that will give you up to three to four users each with its own RT11 workspace and very quick response, and without a hard disc. More users will cause swapping and degrade response, but a hard disc will allow fast swapping to disc, and will extend the number of terminals to about six to eight without much degradation of the response time.

TSX-Plus can also be used as an extended RT11 single-user operating system. It allows full printer spooling, and simultaneous access to several programs at a time. Since the system editor, KED, does not have a multi-file "window" function, I use the "Virtual Line" facility instead. TSX-Plus allows you to control more than one program from the same CRT. I edit on the original channel, and if I need to look at another file, I call up another "virtual" line. A virtual line is like sitting at another CRT and running another program. This allows me to get what I need, and either sign off, or leave it right in the middle and go back to the original workspace. I may have to go back to it again, or I may have to use still another workspace to do something else, all at the same time. RSX (DEC's big OP/SYS) has this facility, but the price is rather steep, especially compared to TSX-Plus.

You can have several workspaces controlled from your CRT, switching between them as necessary. If something needs to be done, or output is to be displayed, the other terminal beeps you at your terminal. You can interrupt what you are doing, switch to the other line and check out what the beep was about, take appropriate action, and go back to what you were doing before. Once you get used to having this utility, you can't figure out how you were plodding along before. Spooling also allows you to print out a report to a file and have it printed out without taking up the line — you can go about your business without waiting for the printout to finish.

For that really big job, you could

# Summoning Solutions DIGICALC v.1.2<sup>T.M.</sup>

DIGICALC 1.2 brings new dimensions to the DEC system user. This truly advanced version has immense capacity for spreadsheets that generate budgeting, financial modeling, project management and many types of analyses. This most flexible software is the perfect combination of procedural and non-procedural language. Once learned, the scientific concept of pattern recognition that has been designed into the keypad aids recall for professionals and executives with little computer experience. No other program for DEC equipment has such extensive HELP built in. The user is in command and can define functions, consolidate multiple spreadsheets... even integrate with existing systems on a multi-user level.

With over 400 copies installed and 8000 users world wide, a simple call to WHY Systems will give you finger tip access to the more perfect power of DIGICALC<sup>TM</sup> 1.2. Runs on VAX/VMS,\* PDP-11\* and RSTS/E.\*

buy a new backplane with 22-bit addressing for about \$400.00, and use more memory. Most replacement backplanes are about the same size as the Heath unit, but have about twice the capacity. Be careful if you buy a used one, as there are several types of Q-Bus backplanes. Unless you want to use an old DEC RL01/RL02 dual quad controller, avoid the "C-D bus" type, as you can only use half of it for anything except the RL01/RL02 controller boards. This special bus seems to me to be one of the biggest goof-ups DEC has

made recently. Avoid them unless you know what you are doing.

TSX-Plus allows you to use the full 4 MB for terminals, if you wish. Some people have 10-15 users, several spooled printers, and some modems (there is time-out support), and are very happy. I don't know how many people you could have ultimately, but with 4 MB you could theoretically have 63 users. Each would have a full 64KB workspace, though the response time would not thrill anyone. Any sort of solid-state disc emulator will allow

even more. The trick is that TSX-Plus has a very low overhead compared to that of RSTS (DEC's timesharing OP/SYS) or RSX with comparable utility. Another nice thing is that you only have to learn a handful of new commands that extend the utility of RT in the timesharing environment, as the bulk of the commands are the standard RT11 ones.

Most programs will run under TSX-Plus unchanged. An exception to this is any program which directly uses the I/O page. This can crash the system, and cannot be allowed indiscriminately in a timesharing system. There is a facility to do real-time work concurrently with normal timesharing, if you want to, for something like data acquisition. Programs like this are rare. The most used program that does this is FORMAT, which directly handles the registers for the device being formatted.

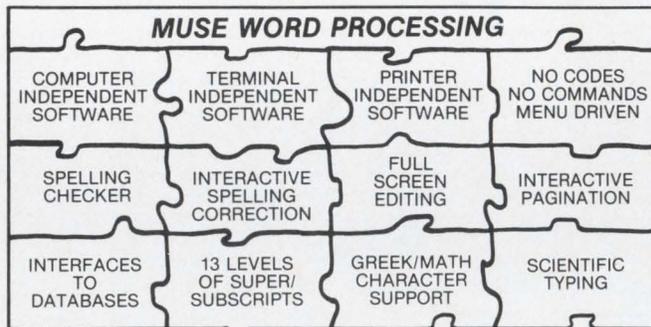

Storage does not stop with floppies. Fairbrother Associates runs a large (169MB, 5 logical RK07's, 28 MBs, 53000+ blocks each) Fujitsu Winchester disc with an Emulex SC02 controller, and this is not the max that can be handled. The Emulex controller has operated perfectly, and the people there have shown themselves to be very competent and easy to talk to.

Mr. Gaio, of their customer service department, spent several hours on the phone with me getting the first drive up, as no one had configured a Fujitsu on the SC02 before. Now there are a lot and what the disc requires is well known, but in the beginning someone had to do it first and find out what was needed. The disc has performed perfectly and is very fast as well (27ms track to track, 55ms worst case), and we at Fairbrother Associates cannot speak highly enough of this combination.

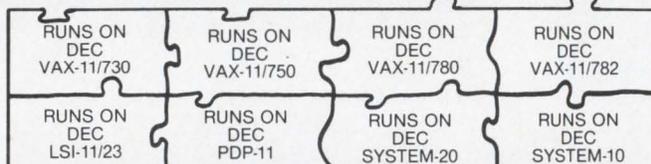

RT11 has several limitations on discs, which at the time they were implemented seemed quite reasonable. The new RT11 V5 will handle much more, up to 64K devices. Each will be limited, however, to 64K blocks, or around 33 MB, because RT can only count up to 2<sup>16</sup>.

Backing up was a problem, so a Cipher Microstreamer 1/2" tape drive with a DILOG DQ 130 controller, which will take up to eight 800/1600 BPI drives, including streamers, was ob-

## WORD PROCESSING FOR DEC

MUSE WORD PROCESSING has these pieces of the puzzle and many, many, more.

### IS WORD PROCESSING A PUZZLE TO YOU???

#### MUSE HAS THE PIECES TO SOLVE YOUR PROBLEM.

MUSE is currently configured to run on over 60 different terminals and virtually any letter quality printer. YOUR computer, YOUR terminals, YOUR printer and MUSE Word Processing software provides the most cost effective full function word processing environment available today. MUSE harnesses the power of your computer with its virtually unlimited disk storage to provide uncompromised performance.

Call today for a demonstration so you can see for yourself.

# SOME STARTLING NEWS FOR DEC OEMs.

## NOW DIBOL SOFTWARE RUNS ON ALTOS MICROS!

Now you can move your DEC® DIBOL™-11 applications software to ALTOS® Computer Systems. You can save substantial hardware dollars when you use any of our 8 or 16-bit microcomputers.

And we won't ask you to compromise on quality or systems solution capabilities.

### Who we are and how we did it.

We know our business. Since 1977, we've delivered more than 30,000 multi-user, multi-tasking systems to major OEMs and systems integrators worldwide.

Our DIBOL compilers allow our 8-bit and 16-bit microcomputer systems to run applications software written in DEC's DIBOL language. The result is a unique advantage in cost/performance to any DEC OEM.

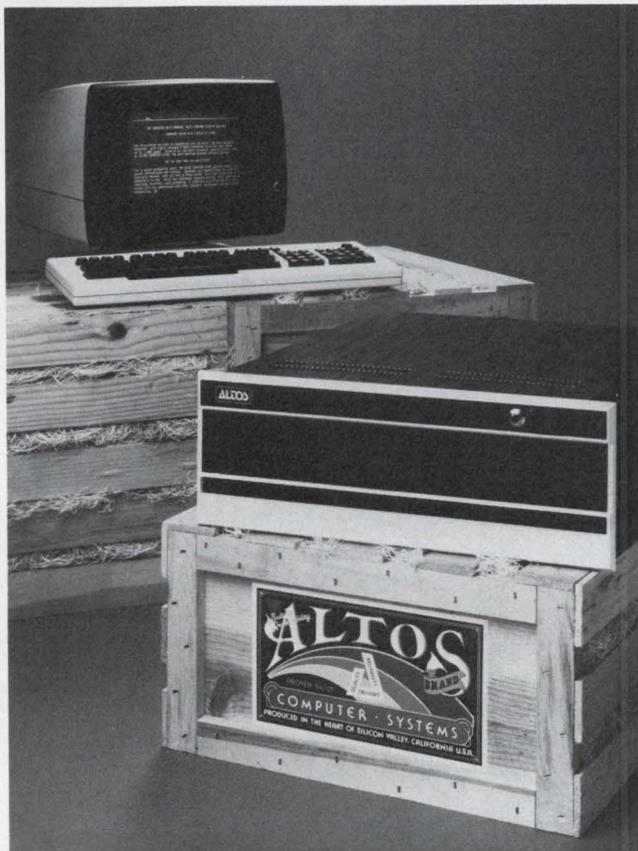

With a single user system you can save up to 40% compared to DEC's equivalent (DECMate, PDP-8, and PDP-11/23, -11/24 or -11/44).

On a multi-user system the savings are even more dramatic. You can get an Altos 8-user system for one-third the cost of a 6-user DEC PDP-11/44 system.

### You supply the solution and we'll supply the right system.

While you talk solutions to your customers, we'll be delivering the right system to meet that solution.

We can offer just the right storage option, too. Depending on your requirements, you can get from two megabytes on dual

floppies, up to 80 megabytes of integrated Winchester disk, and a mag tape back-up option.

Altos also supports 8-bit and 16-bit popular operating systems like CP/M, MP/M™, OASIS, XENIX™/UNIX™, and MS™-DOS.

We also provide cost-effective solutions for local networking, Ethernet™, and remote communications to mainframe computers and networks.

### Why choose

#### Altos Computer Systems?

When we deliver the best product for the best price we also free you from competitive pressure. And that means you can do what you do best: sell cost-effective solutions.

As if that wasn't enough, Altos is the proven worldwide leader in

single board microcomputers and the professional choice of Fortune 1000 companies, computer service organizations, major software developers, and even mainframe computer manufacturers.

Give us your business and we'll give you a cost/performance advantage your customers and competitors will take note of.

For further information, including product data, OEM pricing, and service options, call our toll-free number or write:

**800-538-7872**  
(In Calif., 800-662-6265)

tained. DEC is selling the microstreamer under their own name as the TSV05, without the steaming mode. I find the microstreamer to be a very reliable device, and once you learn the rites of passage into magtape (this means read the manual concerning tape copy operations), simple to use. The DQ 130 has also performed very well, and no problems have been encountered in two years, aside from the ones that would not have occurred had the manual been fully read first.

Many companies sell full tape sub-systems from under \$5000.00 for a small 12 1/2 IPS tension arm model, to over \$9000.00 for a 125 IPS vacuum column model. Because of the Winchester back-up problem, tapes are being developed that are cheaper, faster, and more reliable than their predecessors. If a tape is out of the question right now, wait a while, as some new 1/4" cartridges with 45-70 MB of capacity will be available shortly.

Once the Fujitsu was up and running, we didn't need the RLO1 or RLO2, but we wanted to keep them on line for swapping software. We procured a NETCOM backplane that accepts the RL controller (two quad-wides) in two special slots, and allows 12 more dual wide boards to be used. It's also of much better construction than the DEC backplane, which was sometimes very temperamental.

Most people won't have the RL problem, but it is easy to fix if you should. We try to use all of our equipment, to get the most out of our system. A little drilling was necessary to make it fit in the DEC box, but it took only about two hours to get it out, replace the backplane, and assemble it back together.

Big discs can present problems, so there is some software around, some public domain, some proprietary, to help with some of them. In P/D, there is a virtual device handler that allows you to further break up the discs into "virtual" devices. They look like a large file on the disc directory, but inside they look just like a block-replaceable storage device, an odd sized disc. We have several to aid in logical storage of different types of files. LETTER.DAT has our correspondence, FORTRA.DAT has FORTRAN programs, MACRO.DAT has MACRO programs, etc. They are given the logical name to indicate their

functions, such as FOR:, MAC:, GAM:, etc. The assigns are handled in the start-up indirect command file "STARTS.COM" on each boot-up.

Locating a file in this environment can be frustrating, so some proprietary programs were written to help. Among other things, Fairbrother Associates sells a program called LOCATE. LOCATE will search a user-entered list of devices, virtual, logical, or physical, for a given filespec, and print out a report at the CRT or on the printer. This makes keeping track of files on systems with several virtual device files much easier. (For information, send a SASE and \$1.00 to Fairbrother Associates and literature will be sent to you on this and other products we have that might interest you).

Virtual devices can also be nested (at least with the VD handler, some others may not) to provide a nested file system. With TSX-Plus, which allows you to restrict each password (optional) to a list of devices, you can have private and public file sets.

There are other techniques and pieces of equipment available with some interesting properties.

Andromeda Systems has a floppy/Winchester, dual-wide controller. This is fine for single-user systems, and saves backplane room for more expansion. However, it seems it would pose problems for a timesharing environment, as the controller can not do both at the same time. This may not be the case, but until I hear from some people who have used it, I can't say for sure.

For more performance, the 11-23 can have a faster clock crystal installed. I'm sure DEC will frown on this, but if you modify an IC socket and solder it into the place where the crystal was, you can switch them back again if problems occur. Don't expect DEC to repair it if this modification is done, but there are others who will handle the repair, and indeed, will do the modification for you. The typical replacement for the 13.75 MHZ crystal is around 18.5 — 19.5 MHZ, for approximately a 30 — 40% increase in speed. This surpasses an 11-34. At this speed, you are running near the maximum speed the Q-Bus will allow. Some boards may limit the speedup even more, but most can run in the 18 — 19.5 MHZ range.

Another "speed" option available

### 11/23-Plus Winchester System with 80MB Removable Cartridge Disk

New 11/23-Plus Winchester System contains the newest PDP 11/23-Plus processor, 256KB of MOS memory, two serial lines and a choice of terminals. Data storage is provided by the newest in 8-inch disk technology, a

160MB fixed Winchester disk, and a companion 80MB removable cartridge disk. Choice of operating systems includes RT-11, RSX11-M or UNIX.

# A COMPUTER DISTRIBUTOR THAT'S ELIMINATED THE BUGS.

We're First Computer.™ And we've taken the problems out of buying mini/micro computer systems, peripherals and components. Because we not only offer you the finest in computer equipment. Like DEC, Control Data, Emulex, Cipher Data Products and Florida Computer Graphics. We also offer you the finest in service and customer support.

ship complete computer systems within thirty days.

## WE'VE ELIMINATED THE SLOW DELIVERY BUG.

Often you have to wait months to get the computer products you need. But we warehouse a huge inventory of high quality, factory-fresh products. So when you need computer equipment fast, you just have to call us. Or TWX us your order. And we'll pick,

test, pack and ship it within three days. Or the very same day for a small expediting fee. And we can

## WE'VE ELIMINATED THE NO ANSWER BUG.

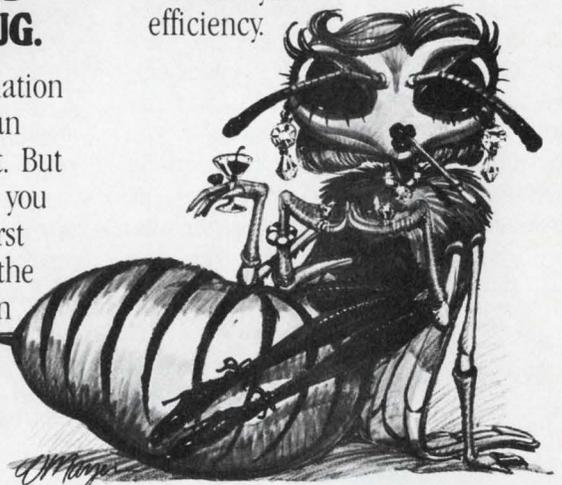

When you need information about a product, you want an answer. And you want it fast. But many distributors can't give you technical information. At First Computer, we're experts on the products we sell. And we can tell you exactly how they function. We not only test the individual products. We configure and test your complete system as well.

So you can be sure everything you buy from us operates properly. And we continuously examine the viability of new computer products in relation to your needs.

So we can help you select products that best meet your application requirements.

## WE'VE ELIMINATED THE HIGH-PRICE BUG.

Usually there's only one way to get a good price on computer products. Place a large order. But not when you buy from First Computer. Because we pass along our substantial savings to you. Our prices are some of the most competitive around. And our technical expertise helps you avoid costly errors. First Computer is in business to increase your efficiency.

Reduce your inventory. Give you peace of mind. And, best of all, save you money.

Call First Computer today. And shake the bugs out of your system.

*We're humans that function with computer-like efficiency.*

sounds quite interesting. It allows you to run a Motorola 68000 CPU, with its own special bus, along with the Q-bus. I don't know much about it so far, but it looks like the next step for someone who needs more power than the 11-23 can give.

The 68000 is a 32 bit CPU, and is usually considered faster than a VAX. The drawback is, of course, the software. Unless someone comes up with an RT11 emulator program (a lot of bucks to be made for the person who gets this package together), you will have to write a lot of your own system stuff. If an RT11 emulator that will run in parallel with the '03 or '23 is written, perhaps the 68000 will do the computing, and use the '03 or '23 to handle the peripherals and I/O, keeping much of the old RT software. It looks as though the 68000 will really catch on, giving companies the incentive to make other things available. This could be a real sleeper. We'll see as things progress.

For the real engineering types, some small array processors are available, notably the SKY processor, which is on two quad boards and fits right into two adjoining slots in the backplane. They usually have many FORTRAN callable subroutines IN HARDWARE to manipulate arrays.

---

**"If it doesn't fail in the first three months . . . it probably won't fail for its lifetime . . ."**

---

They are VERY fast. A thought— since text is just an array of characters, would this turn an 11-23 into a fabled database machine?? An interesting project for someone.

I/O is now usually done with DLV11-J boards. They have 4 RS-232 "data leads only" (pins 1,2,3,7, with 20 held high) on one double wide (half quad) board. Since DEC equipment works on Control S/Control Q protocol, almost anything serial that uses it will run on the system. Modems don't have to use the expensive DLV11-E board, although the software changing of the baud rate, etc. is nice but not necessary. They can be purchased from aftermarket manufacturers for about \$250-300 dollars. DEC's costs \$450.00. A dual wide board with eight serial lines is available, to save even more space.

Another nice thing is that the Z-19 terminal is a VT-52 CRT emulator. It can be used on the pile of software that uses VT-52 code. I don't know why the "ASCII" mode wasn't upgraded to be VT-100 compatible, as this is where the big sales-numbers are. Heath could have been first and cleaned up, but they dropped the ball somewhere. I understand that there are some people coming out with a chip to do just that. That's the second big mistake that Heath/Zenith made, the first being not to support the H11 as it should have been. Ah, well, life still goes on...

It may interest some people to know that there are very good A/D and D/A converters available for about \$600—\$1000.00. These are really professional boards. The "MINC," the laboratory data acquisition computer system, has many similar I/O modules available, and a large library of subroutines to take in data and massage it into reports and realtime graphics displays. These have a special BASIC that has built-in commands to handle the interfaces and the data.

This makes writing your own programs to handle the data the way YOU want much easier.

DEC and the aftermarket crowd are always putting out new gadgets for the 11. Whatever DEC puts out, a month later someone has a better model, with more features and at less cost than DEC's. On the other hand, DEC puts all its products through lengthy tests to make their products as reliable as possible. When chips were new, this was very important, but as chip reliability has gone up, the boards have become very reliable. Perhaps all the testing DEC does isn't necessary unless it is for super-critical industrial or military purposes. If it doesn't fail in the first three months (usually under warranty) it probably won't fail for its lifetime, if its environment is stable.

Finally, speaking of stable environments, a final thing to consider is a power conditioner. The boards last a long time if their voltage isn't exceeded. I had a friend who left his computer plugged in during a rainstorm when lightning hit the power lines MILES away. He lost a couple of power supplies and some serial lines, and had some damage to his CRT and other systems. One of my printers would beep and feed several sheets of paper through and settle down every once in a while. It also occasionally occurred during a printout. This is irritating, especially on long runs.

Both he and I now open the circuit breakers when bad weather comes along. I have installed a couple of power line conditioners to short out noise and spikes from the power lines. They say they protect equipment from lightning, but I don't want to test it on my system. This is in addition to the circuits in my power distribution panel. It's not that expensive, and can save a lot of time and trouble.

In conclusion, the Heath H11 owner should simply rename his machine a DEC PDP-11/03, and realize the world will be a better place. It may cost a little more, but you have a real business/engineering machine, not a toy. Remember, those thousands of PDP-11 users can't all be wrong. Someone, whose name eludes me, once said "Nobody loses ALL the time." Take heart, for though the jury is still out on the H11, the PDP-11 is a great machine.

**PCTERM**  **digital VT 100**

Replace the most popular video terminal with the most widely accepted personal computer. The IBM Personal Computer combined with Coherent's PCTERM software allows you to converse with a DEC host as if you were using a VT100 video terminal.

- complete VT100 terminal family
- PCTERM interacts at speeds up to 9600 baud
- simple file transfer with no cooperation with host computer
- host to PC file transfer mode with guaranteed file transfer
- session logging to diskette
- full use of attached printer, including print reports wider than screen

# RECOVERY SYSTEM

By Brian Johnson, 54 Oakleigh Gardens, Bitton, Bristol, England

This article describes the design process behind a general purpose recovery system for interactive real-time RSTS applications. This could be applied to any multi-tasking operating system.

## Design Objectives

The main objective was to allow the files for a set of application programs to be restored to as near as possible the state that they were in prior to a system failure, either hardware or software. I will refer to the processing of the original work as the "live run" and its recovery as the "recovery run."

The applications involved the on-line and real-time updating of data files. The design was influenced by the need for the files to be updated as the user information was entered. It was possible for two users to be updating the same data record and for either of these updates to be rejected at user request. As an example, two users could be entering stock requisitions. Each requisition covered a number of stock lines, one or more of which is common to both requisitions. While the stock balances have to be updated as the entries are made, either of the users could reject his requisition before its completion.

The programs were to be written in BASIC PLUS using our own file indexing and access routines on straight block/IO data files. As the updating of certain of the data records was to be real-time with the data entry, program size was thought to be a critical factor. We also wished to make the system as general purpose as possible, and for it to be capable of being integrated into any BASIC PLUS program with as little programmer effort as possible.

As in reality the incidence of system failures resulting in data loss requiring the use of such a recovery system is rare, the system would have to have only a small impact on performance and system capacity.

## Design Considerations

Our first thoughts were directed to removing the need for a software solution and in the event of a system failure, restoring to the last backup

and re-processing. This was rejected as the system was to be used in the remote offices of timesharing customers on over 30 terminals by a variety of users. The system was to be recovered in a way that involved the end users as little as possible.

We then thought along the lines of logging the images of all disk records that were updated to files on more than one disk. This would allow us to restore all the files to their latest state in the event of a failure. The problem was to cater for overlapping transactions such as the stock requisition example given above that were only partially completed at the time of the system failure. This could have been overcome by updating the stock information "temporarily" and then completing the update when the transaction was confirmed. Whilst some of the record content was updated in real-time, in order to meet program size and response constraints, as much as possible was left until the end of a batch and carried out by other programs. As well as partially completed transactions we then had partially completed batches to cater for.

The obvious answer was to log transactions and then re-process these against the restored backup files. However, this would have involved heavy costs either in "outside" software or in our own development time. If we had carried out the development, unless we decided to write our own transaction processing package, we would have been writing application specific code and therefore not meeting the objective that the solution should be general purpose and involve as little programmer effort as possible during the development of the application code.

As the applications were basically interactive, we then looked at the possibility of logging the users' data and re-processing this against the restored backup files. Providing we could pass this data back to the programs in the order it was entered, the same programs could be used in the recovery run that were used in the live run.

We had a set of functions that handled all user I/O. If we could embed

the recovery system within these functions it would mean that there would be little effort in implementing the recovery system within our existing applications, and the recovery considerations could be transparent to the application programmers.

In adopting this approach the computer had to carry out as much work in the recovery run as it did in the live run. This would only be appropriate in situations where the data entry portion of the application represents the bulk of the work, and where the critical factor in processing times is user data speed.

## Recovery System Design

We decided to use a detached logging program to which all user responses would be directed during the live run using send/receive. The data would be logged on up to three files which could be on disk and tape.

The logging program requires the name and user's account number for each program that is run. As we had a menu system through which all programs are run we could have modified it to supply this. However, as additional information would have been needed on each menu entry, and we did not wish to introduce menu system file changes at this stage, we introduced an initialisation function which we inserted at the start of each program. The initialisation function looks up the location and file name of the program and the user's account details and sends this to the logging program.

The initialisation function also opens the keyboard on a specified channel number during live processing. The keyboard is automatically replaced by the null device on this channel during a recovery run. All print statements are made to this specific channel number or they must be made conditional on a flag set by the initialisation function to indicate a live or recovery run.

The initialisation function passes three other items of information. The first is a flag to indicate if the recovery is to be frozen whilst the program is running. The need for this resulted from program synchronisation considerations. In dealing with interactive programs, the overlapping of the programs during the recovery run is effectively controlled by both re-running programs and re-processing the users' responses in chronological sequence.

# EMULEX TALKS DEC

4

## IS YOUR VAX SUFFERING FROM A TERMINAL CONDITION???

How would you like to double (repeat, double) the throughput of your terminal-bound VAX-11/750 or 780—for less than \$6,000? DEC's DMF-32 modules have already slashed the data-communications overhead of "small" VAX-11/730's. Now Emulex is extending DMF concepts to the whole VAX family. With bonus benefits. Emulex's single-board CS21/F multiplexer gives you 16 asynchronous lines (instead of 8), with modem control for remote terminals on all 16 lines (instead of just 2). Emulex CS11/F expands this to 48 lines—again on a single board.

## THE BEST OF DH AND DZ...

Dynamic selection of the most efficient mode of operation, DMA or programmed-I/O, by the DMF driver significantly reduces DZ11-type interrupts.

Emulex's DMF emulations provide DMA (DH11) operation when queued output data is greater than 64 characters in length, as in word processing, screen editing and graphics.

Because there is CPU overhead involved in setting up a DMA transfer, interrupt (DZ11) operations are more efficient for lesser amounts of data, such as character echo and data entry. The DMF driver can transfer "bursts" of up to 32 characters to the 32 character output silo on each line, under a single interrupt operation. Result: Emulex DMF emulations provide the most cost effective VAX performance enhancement currently available!!!

## SOON (STAY TUNED)...

And that's just for starters. Emulex will soon offer two new DMF-type multiplexers that will allow you to expand your system, in DMF mode, to include statistical concentration (an Emulex exclusive). Result: Single-board modules that can support up to 128 or 256 local or remote terminals. Become a Believer. Write for a more extensive explanation of Emulex data communications and the new DMF emulations.

## SYSTEMS 10 AND 20, TOO...

The word is out. Emulex communications technology has been extended to DEC System 10 and System 20 mainframes. How? Users are plugging Emulex modules into the PDP-11/34's or 40's that serve as front-ends for nearly every large DEC installation. No change in front-end or mainframe software required.

## FROM THE EMULEX FILE...

Read about all these new Emulex products and a lot more in the new *Emulex Controller Handbook* now coming off the press. Write or call for your free copy.

CIRCLE D72 ON READER CARD

However, the recovery run will have the effect of compressing these responses into a shorter period than that in which they originally took place (you hope!). You may have programs or parts of programs which are non-interactive and which, during the recovery run, must not be overlapped with the processing of user responses that may have been entered in the live run after the completion of the non-interactive phase. An example would be the entry of stock receipts where the updating of the file is carried out after the batch of receipts has been entered. If during the recovery run the file updating became overlapped with stock issues that had originally been entered some time after the receipts had been processed, out of stock conditions may arise that did not occur during the original run. To cater for this it is possible to "lock" or "freeze" the recovery process. The lock may be requested within the initialisation function at the start of the program or executed by a lock function called within the program. During a recovery run, after a lock is requested, no further programs will be started or responses passed to other programs until the program executing the lock calls an unlock function.

The second piece of information indicates whether the program is "run" or "chained." During the recovery process run programs are started by the recovery system whilst chained programs are started by the preceding program as normal. A standard core common layout includes status information indicating whether a program has been run or chained and whether it is part of a recovery or live run.

The third piece of information is the message packet size for communication with the recovery logging system. During the logging of the users' responses, the effect on the system's performance is minimised by the logging interface routine in the application program building several responses into a packet and sending one message to the logging program. The size of the packet is given by two parameters. One specifies the maximum number of responses that may be buffered before the packet must be sent and the other specifies the maximum size in bytes to which the packet can grow. These govern how much data may be lost in any unlogged packets in the event of a system failure. The optimum packet size is a function of the size of and the likely rate of entry of user responses in any particular program. If the rate is likely to be high then a large packet size is probably appropriate, whereas if the user data entry rate is low, a smaller packet size is preferable.

A termination function is also introduced at the end of each program. This merely informs the logging program that the program has ended and bands any part filled packets.

The input functions operate by logging all user responses. No knowledge of the purpose of the response is needed by either the application or the logging programs. There are some instances where this assumption falls down. The first is illustrated by the case where the user is asked to load or unload a disk or tape unit. Even if the unit number is the same during the recovery, the recovery system will need to pass the request to the user for action and hold the recovery run until the user signifies the action as having been completed. It may also happen that the response could differ during the recovery run from that entered during the live run.

The second case arises because the compression of the user responses from different users can create a situation where functions overlap during the recovery run when they did not during the live run. We have already discussed the lock and unlock functions above. This is a slightly different

problem and an example would be a prompt for a stock product code. This prompt may give rise to a "disk block interlock" condition in which case the user is informed of the interlock and re-prompted. If this happens during the live run an additional response would be requested that may not arise during the recovery (as the disk block interlock may not occur). Alternatively, it can arise during the recovery when an additional response would be required that was not supplied during the live run. In either case it can result in the user responses getting out of step with the corresponding prompts and the failure of the recovery. This is prevented by a "re-prompt" flag. If this is set the prompt field for each input is checked against the previous one. If they are identical (including any screen coordinates) during the live run, only the final response to that prompt is logged. During the recovery run the logged response will be re-submitted until the prompt changes.

The impact of both logging and recovery processes on the system's performance is minimised by only logging programs that modify the content of the data files. Obviously report and enquiry programs need not be recovered.

#### Recovering a System

The recovery program will sort all user responses, program start and end records and recovery lock and unlock records into chronological sequence. The data files are then restored to their state at the beginning of the logging session. The recovery program will then run the programs detached and feed the responses back to the programs. A flag in core common which is picked up by the initialisation function indicates that the program is recovering in which case it will receive the responses from the recovery program.

After the last of the logged responses is passed to the programs, the recovery program sends a final message which causes each program to revert to live running. It enters a hibernating state until it is attached to when it displays the next user prompt. The recovery system logs the recovery process so that it is possible to let each user know what previous responses were processed. The possibility that the recovery program should log each program to the terminal from which it was initiated during live processing was rejected on security grounds, though obviously this would be a trivial change.

**Dear Dr. DEC:**

As fine a stand-alone as our DECmate I is, it seems to be viewed by DEC and by after-market folks as DEC's bastard child. We've tried since taking delivery last June to get answers to these questions:

1. What exactly is the VT-278 processor in the DECmate?
2. How does it alter the terminal from the basic VT-100?
3. Is the DECmate/VT-278, although PDP-8-based, compatible with PDP-11 equipment?
4. Can memory be expanded with plugs, as can the myriad of micros and minis out there?

5. Can memory be expanded by connection to a PDP-8 minicomputer?
6. Is there a Winchester hard disk available?
7. Can the DEC Personal Computing Option for the VT-100 be added to the DECmate/VT-278?
8. Can a VT-100 terminal be added to the DECmate, and the DEC Personal Computing Option added to the VT-100?
9. Where can we find software equivalent to VisiCalc? Is Pyramid's "Number Cruncher" the closest?
10. Where can we find graphics software?
11. Can we control cursor blink, reverse video and forms mode, as on the VT-62?
12. Are any of the above options worth the cost, considering the number of machines now available with up to 256K?
13. Can the new Pro 300/DECmate II use the 8" RX02 drives? This would allow us to add a DECmate II as a second, more versatile stand-alone, and use our present 8" media files on either machine.

We'd appreciate your help on these questions; if you can't answer them in your column, perhaps you'd do it by letter, or refer us to the appropriate people at DEC. We've tried numerous departments, including Field Service, but to no avail.

Phillip B. Warbasse  
Warbasse Associates  
Natick, MA

**Dear Phillip:** Thanks to Gary Cole at Digital Equipment Corporation for his help in answering your questions. Gary used to work with DECmate I's but is now working on Rainbows.

Here's what we've learned:

1. A PDP-8.
2. The terminal is not a VT100. It simply shares the shell, tube and keyboard, but is entirely run by the PDP-8 processor.
3. The connection of DECmates to PDP11's is best done using its DX communications capability.
4. DECmate I comes with maximum memory (32K) already installed.
5. No.
6. RL02 disks were planned for the DECmate I's.
7. No.
8. No.
9. Digital maintains a software catalog for the DECmate I's which contains many software packages including some financial modeling.
10. Only limited graphics (VT100 type) are available.
11. No. But the VT278 processor does emulate VT100 screen capabilities.
12. The DECmate I remains a viable product because of its price and availability.
13. There is an adaptor to allow use of eight inch RX02 disk drives.

# THE BUILDING BLOCKS for MICROPROCESSOR DEVELOPMENT

**CROSS SOFTWARE PDP-11/VAX HOST OPERATING SYSTEMS: RT11 RSX RSX+ UNIX TSX+ VAX/VMS**

CYMRIC supplies **all** the pieces . . . from higher level languages like SUPER, to cross assemblers, debuggers, down loaders . . . working under **all** PDP-11 operating systems, plus VAX/VMS, and for **all** the popular micros.

And CYMRIC supplies target operating systems, as well.

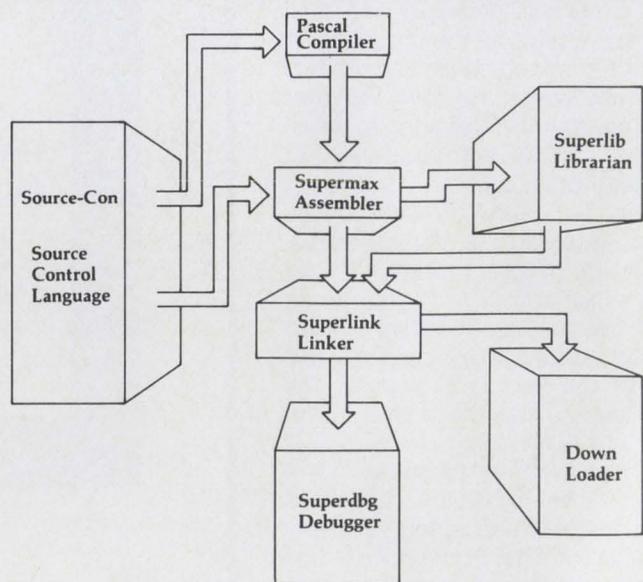

All of our software is written on assembly language for the fastest, most efficient operation. And all of the pieces fit together. Each module is efficiently interfaced with its neighbors to produce a **Totally Integrated Development Environment.**

tions. I wonder at which other editorials and articles, ostensibly written to inform me, the reader, are not but camouflage for other self interests.

Second, I wonder if you have not gained an unfair business advantage over competing software products by having access to user responses and "bingo cards." Information generated and paid for by your advertisers.

Finally, there is the issue of your readers personal and professional security born out of trust for their editors. They think their editors tell it like it is. Nothing but the whole truth. And I wonder . . .

Have you not breached their security?

It was interesting to note the March 1983 letter in which it was said that

"there simply isn't enough profit margin to support highly trained technical sales people" (in selling personal computers). A comparison is made to the automotive industry.

I should like to point out that today the electronics industry is successful, the automotive industry isn't. Computers cannot be sold by car salesmen who only know enough to tell us it "comes in six decorator colors." One of the reasons the electronics industry is doing well today is that companies do a job of telling the customer what the product is all about.

Government handouts keep the American automobile industry going. We in the electronics industry do not need to learn the tricks of the automobile salesman so we can emulate the beggars of Detroit.

Sherman Rigby, P.E.  
Nova Biomedical  
Newton, MA  
\* \* \*

I can't thank you enough for publishing my letter in The DEC\* PROFESSIONAL (January 1983 issue). The response was overwhelming. Not only was my problem solved (couldn't form feed my LA100) but many new ideas were brought to my attention by some of the many ingenious people who read your magazine.

I wish I could thank all of the people that responded to my call for 'help'. They were very helpful.

You'll hear from me again.

Thanks, Marty Chojnacki

Do you think your readers could give us a hand? We're looking for some older Digital Equipment Corporation equipment that was used in their ill-fated microcomputer system. We're particularly interested in finding the following:

M7341 Processor Module (8008-based)

M7344 Memory Modules (YA, YB and YC models)

## The BENCHMARK MONITOR for RSX

Installs in minutes, no SYSGEN needed. Reports CPU usage by task and by system, I/O activity by device, task and LUN. Disk tuning stats, overwrite trapping, and CPU-bound task analysis. Will run in memory-based systems. More updates planned. Users of unsupported releases, we care about you too!

From \$1000/CPU.

## SOFTWARE PROFESSIONALS

TANO CORPORATION is committed to bringing creativity and ingenuity to its products which include the industry's most sophisticated marine and industrial supervisory control, energy management and data acquisition systems. Our continued expansion offers new opportunities to Software professionals.

### SENIOR SYSTEMS ANALYST

Provide technical and administrative leadership to software projects. Candidates must possess relevant degree and 3-5 years experience in real-time data acquisition and control systems. Applications include liquid or gas pipeline systems, energy management, process control, Motorola 680X, RSX11-M or VAX experience helpful.

### SYSTEMS ANALYST SPECIALIST

Design software products and custom systems. Candidates must possess relevant degree and minimum of 2 years experience in real-time software development, Data acquisition and control, process control, Motorola 680X, RSX11-M, VAX preferred.

TANO CORPORATION offers an excellent compensation and benefit package, including 100% Company-paid medical insurance, incentive plan and pension trust. Please telephone to present qualifications, or submit confidential resume, to:

\* \* \*

The points raised in the article by Yuan Sung, "Comparison of Floating-Point Numbers in Basic Plus" in the January *DEC Professional*, apply to all computers and computer languages, not just BASIC PLUS. Most fractional numbers cannot be represented exactly in floating-point format, hence the problem.

One of the early programming laws states: Floating-point numbers are like sand. The more you play with them, the dirtier they get and you lose a few grains here and there.

Robert Rosen  
Manager, CAD/CAM Systems Group  
Department of the Army  
Adelphi, MD

\* \* \*

In the January *DEC Professional* I had an article describing the EDT help file format. Within the article there was an amusing figure that illustrated

the format of the EDT help file. Unfortunately, there is an error.

The help level for "TERMINALS" was incorrectly numbered with a level of "4" instead of "3." The manuscript I had sent to the *DEC Pro* was correct. Somehow in the typesetting process this was "corrected" to read "4" instead of "3."

I apologize to the readers for the inconvenience and confusion that this might have caused.

David Spencer

Re: "Friendly is in the Eye of the User," March 1983

As a fellow word processor user/installer (of CTOS), I think the USER-SEDUCTIVE SYSTEM is a great idea if one of the USER-CAPABILITY features is correctly referenced as a:

Boilerplate - static or consistent part of a document — [Colloq.] n. the stereotyped news, feature, and editorial items that are syndicated to small publications.

not:

Potboilers - commonly referred to as quickie articles — n. a piece of writing or the like, usually inferior and uninspired, done quickly for money.

Users of CTOS, or any word processor - probably would not like to be referred to as producing "inferior or uninspired" documents.

# MEMO: FROM THE SYSTEM MANAGER

... JOE DOYLE

While most DEC systems don't seem to have operators, we all ought to pay more attention to other people's problems. Sometimes it's as simple as . . .

During the last several weeks, I have noticed an abandonment of common etiquette by many employees while using the line printers throughout the building. There are several items we should all keep in mind when using these machines.

1. The computer room line printers have default paper types. LPO: uses standard 14 inch paper. LP1: uses narrow white paper. Please feel free to change the paper if you need to, BUT... assign the machine before changing the paper, put the original paper back in the machine when you are finished with your special form, deassign the machine when you are finished, and see to it that the form is at top of form in the printer, AND ON LINE!

2. Occasionally, we change the ribbon type in LP1:. If you change the ribbon type, remember to put the original ribbon back in the machine when you're done. If you don't know how to change the ribbon DON'T!!! If you ink the ribbon, please leave the "inker" where you found it.

3. If you open a box of paper, neatly cut off the box flaps or the top. This improves appearance, makes the box easier to store, makes the work area neater, and most importantly allows the paper to easily leave the box and enter the printer.

4. When you are done with a box of paper, return it to a storage tray, shelf, or area. Don't leave it in the middle of the floor where someone else will trip over it or have to move it.

5. If a printer is broken, tell someone in D/P. We will fix it as soon as we can.

6. Don't open a new box of paper unless you are sure you need to. Most of the clutter in the printer areas is due to multiple boxes of the same type. (I was going to say laziness, but thought better of it.)

7. The printers in departmental areas do not belong to the department. They belong to the company. Those printers were placed in those locations for the convenience of the department. If a printer is broken in an area, please ask the other department if you can use their printer. If someone asks to use a printer and you are not using it, please help them out. Most of our printers are underutilized.

8. Use the correct printer for the job. Word processing printers should only be used for letter quality printing.

9. Most people (myself included) are not satisfied with PL1: as a letter quality printer. It is however a good standard printer and if care is taken it does work as a letter quality printer. I will look into replacing it, but this will take time.

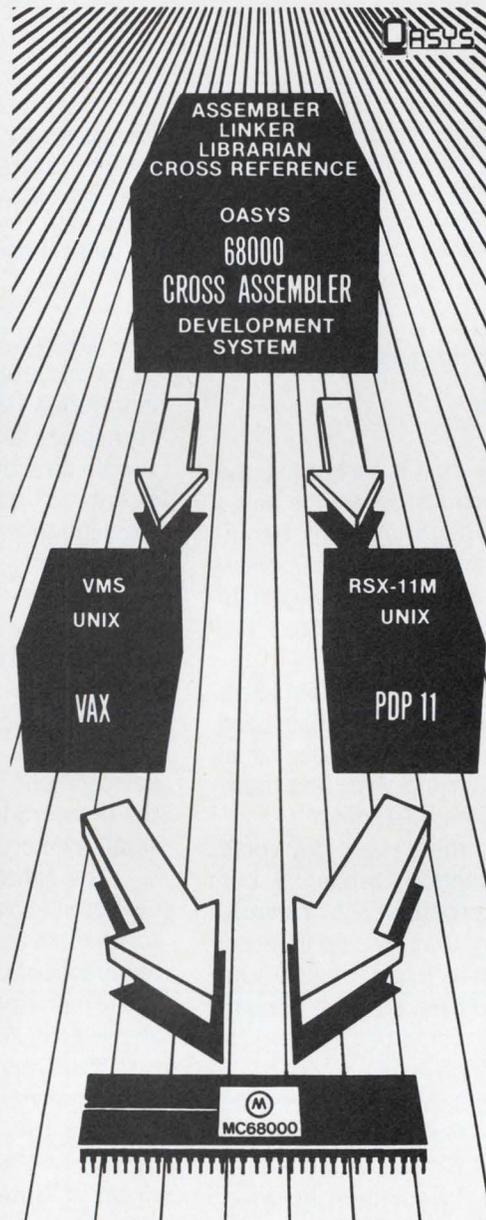

10. Occasionally it is a good idea to change a printer's ribbon. It's nice to be able to read what you are printing. You each should be able to change a printer ribbon and it does not take more than ten minutes.

11. Check the bins for LPO: and LPI: printouts regularly. They seem to pile up. If you receive unnecessary or duplicate reports, tell us. In the meantime, don't expect someone else to discard them. You are responsible for your reports.

12. We are all aware of the problem with LPO: printouts not folding properly. We are trying to rectify this situation, but in the meantime, let's all help out by folding reports, and placing them in the bin, even if they aren't yours.

Thank You.

# CROSS DEVELOP 68000 SOFTWARE ON YOUR VAX OR PDP-11

The OASYS 68000 Cross Assembler Development System has earned the reputation as being the most complete and most reliable 68000 cross development system available. To date, over 300 copies have been sold.

## PACKAGE CONTENTS

- Cross Assembler
- Linker
- Librarian
- Cross Reference

## OPERATING ENVIRONMENTS

- DEC VAX/VMS or UNIX
- DEC PDP-11 RSX-11M or UNIX

## FEATURES

- Relocatable or absolute modes; 16 sections
- Include facility
- Multiple input files
- 30 character symbols
- Virtual memory symbol table (unlimited number of symbols)
- Full macro capability with argument substitution
- Conditional assembly
- Compatible S format load file format - can be down line loaded to 68000
- Interfaced with Whitesmith's C and Pascal
- Written in C

## PRICE

- Binary License \$3,000
- Source license \$10,000
- Maintenance \$360/year

# Programmer's Notebook

Rick Scherle is President of Software Techniques Inc., a small international consulting firm. At 28 years old, Rick has been in the computer business for 11 years. Beginning as an Electronics Engineer, Rick worked at NASA, Xerox, and Digital before co-founding the southern California-based firm four years ago.

When he isn't exploring hot springs or camping in Mexico, Rick concentrates his energy on finance and marketing in the computer field.

## UNEMPLOYED PROGRAMMERS?

By Rick Scherle

"I have to think that the average man is sort of like me in his comprehension of computer technology. Maybe he's a half-step behind me. He isn't stupid (he knows what computers are). But, I just learned the other day that somehow every aspect of a PRINT statement is stored in the system in electrical impulses, organized in little groups of 16. I will never know 'exactly' how that's done."

"It makes me believe that we may be headed into this sort-of-frightening picture of the future which has been foreseen by so many people. It's not hard to visualize us all spending most of our time communicating with and interfacing to systems that we don't really understand."

Certainly, working with programmers every day could lead you to agree that this observation, made by our marketing manager, is indeed prophetic. I recently overheard a brilliant programmer say that he didn't understand why high-level languages (such as BASIC and COBOL) had ever been invented. "If people had been programming in MACRO all along," he reasoned, "they would be so good at it by now that they wouldn't 'need' a high-level compiler."

It follows (if taken to the extreme) that MACRO should never have been invented either. A "really good programmer" could toggle it in from the front panel. To go one step further, we can imagine a "super guru" who, knowing what the machine will do in any situation, doesn't bother to put the instructions in the machine at all.

But this discussion overlooks the fact that the declared purpose of any profession is to obsolete itself. For example, when medical science is really working effectively, we won't need doctors because we will all be healthy. The focus will be on prevention rather than after-the-fact treatment.

The computer profession is the same. Programmers, for the time being, are a necessity. But, a new generation of technology could make today's highest-demand job as obsolete as that of "auto worker."

Today's computer science suffers from a simple economic problem: the people who make the decision to buy computers cannot make them work. If computer technology is to survive, the machines of the future must be usable directly, without today's need for hiring expensive talent to translate the purchaser's requirements into machine code. In fact, the job "programmer," as we know it, will probably not exist in another decade.

The new trends in computer design are toward more usable systems. Artificial intelligence and heuristics already play an important role in the systems of the 80's. These new architectures rely more heavily upon good systems analysis and design than on efficient coding or "trick" data structures. These systems are optimized for usability, low development costs, and easy maintenance rather than for the more traditional design goals of fast execution speed or small memory size.

The benefits of these design trends are obvious in our own small company. Our staff produces very sophisticated software in only a fraction of the time that would have been required just two years ago. In fact, their productivity is far above industry norms. This is due, in part, to the application of powerful software development tools.

These tools save hundreds of man-hours by generating code, managing databases, and controlling terminal I/O; tasks which would otherwise have to be programmed "manually." At present, these individual tools produce only pieces of systems. But, once all of their capabilities are integrated into a single tool, it will be possible to generate entire systems at "design speed."

Those data processing professionals who adapt to these new methodologies and who keep up with the pace of technology by investing in their own education will migrate into the twenty first century as designers, managers, and engineers. But, the MACRO guru of today, intent on specializing in his own obtuse skill, may well find himself standing in the unemployment line, reminiscing about "the good old days" when his skill was in such demand that he could go anywhere he wanted and name his own salary.

His expertise at systems analysis and program management has made Steve a highly-respected technical author and a frequent speaker at computer conferences. When he isn't working, Steve likes to prowls old record stores for rare albums, watch foreign films, and travel.

## CONVERTING NUMBERS TO STRING REPRESENTATIONS

By Steven P. Davis, Software Techniques, Inc.

A common problem presented to applications programmers is the ability to convert a whole number into its English language translation. That is, to take a number, say 25, and translate it to the string "twenty-five." The most common use for this conversion process is the printing of a check-protect string on drafts produced automatically. We take for granted our human capability to look at a number and do this translation. We, as software engineers, recognize that the computer has no developed ability to do this (conversion).

At first, the task of writing a piece of code to do this conversion may seem complex, considering the exceptions that must be handled. This is an illusion. The process of converting whole numerical quantities into English may be broken down into a consistent, understandable algorithm for coding in any language.

Rather than include only an example of code that performs this conversion, I will present the development of the algorithm in an effort to expand its usefulness in applications not envisioned by myself. Let's start by taking an arbitrary number, such as:

1462395

Let us call this number N, for it may be any whole number. Now, using the common notation of a comma, we will break N into its primary parts.

1,462,395

We will call these primary parts "groups"; a group is formed by the collection of three numbers from right to left until no more groups can be made. We will represent a group by using an upper case G. Groups are thus a subset of N, our number. This particular number has three groups, and to denote groups we will use the notation G(n), where "n" is the group number. Group numbers will be assigned from right to left as the groups are formed, starting with zero. Thus, this number may be grouped as follows:

Group	Elements
G(0)	395
G(1)	462
G(2)	001

Note that where a zero is implied in the number N, it is now represented explicitly when the group is formed. The individual numbers within a group we will call elements, and we will represent elements with the symbol E. Where groups are a subset of the number, elements are a subset of the group. Each group contains exactly three elements, the hundreds, tens, and units column. We will represent these elements with the symbols, Eh, Et, Eu, respectively. So, to redefine our number N to its basic elements:

Group	Eh	Et	Eu
G(1)	3	9	5
G(2)	4	6	2
G(3)	0	0	1

We can now take any whole number, N, and divide it into its finite groups, G(1) ... G(i), and divide each group into its individual elements, Eh, Et, and Eu.

Now that we have developed this terminology, we are ready to develop the algorithm to convert N to its English representation.

We must first define all the text that will be necessary to build our output string. We will use the symbol ".text(n)" reference the text elements, where "." will represent a descriptive prefix for the text, and "n" represents the associated number we will replace with text.

The hundreds and units column of any whole number, Eh and Eu respectively, may be replaced with the text defined below. For example, for Eh of any group, the text element unit.text(Eh), as defined below, may be added to the

**"Speakeasy has been VAX-inated"**

## At last, Speakeasy, the truly conversational computer language

*has* been teamed with the powerful interactivity of the VAX/VMS system to create unmatched computational capabilities. The VAX user community can now experience the versatility of a computer system that has satisfied IBM customers for almost two decades.

Combining ease of use, power and flexibility, Speakeasy provides even a novice computer user with the means of quickly formulating and solving problems in a truly friendly environment. Speakeasy not only provides the tools for mathematical and statistical analysis, econometric modeling, interactive graphics and report generation but most importantly, it can be easily extended by creating interfaces to in-house facilities.

Don't take our word for it. See for yourself. Contact us for a free two-month trial of Speakeasy on your own VAX. Let us introduce you to this eye-opening problem solving package.

**Speakeasy: the language that speaks for itself!**

 Speakeasy Computing Corporation 222 West Adams Street Chicago, IL 60606 312. 346 2745

CIRCLE D226 ON READER CARD

output string. The primary thing to note here is that "zero" is only used when the whole number is "0", or in our terminology, there is only one group, G(0), and Eh, Et, Eu are all zero.

```
unit.text( 0 ) <- "zero"
unit.text( 1 ) <- "one"
unit.text( 2 ) <- "two"
unit.text( 3 ) <- "three"
unit.text( 4 ) <- "four"
unit.text( 5 ) <- "five"
unit.text( 6 ) <- "six"
unit.text( 7 ) <- "seven"
unit.text( 8 ) <- "eight"
unit.text( 9 ) <- "nine"
```

The tens column of any group, Et, is basically as straight forward as the text elements above. There is, however, a special case that must be handled. The sequence of numbers where Et = 1 introduces an exception, although it is easy to handle. These are the whole numbers 10 through 19 inclusive. Note that 10 is not really an exception, but if included will allow the algorithm to check only for Et = 1, instead of Et = 1 and Eu < > 0.

```
ten.text( 0 ) <- ""
ten.text( 2 ) <- "twenty"
ten.text( 3 ) <- "thirty"
ten.text( 4 ) <- "forty"
ten.text( 5 ) <- "fifty"
ten.text( 6 ) <- "sixty"
ten.text( 7 ) <- "seventy"
ten.text( 8 ) <- "eighty"
ten.text( 9 ) <- "ninety"

teen.text( 0 ) <- "ten"
teen.text( 1 ) <- "eleven"
teen.text( 2 ) <- "twelve"
teen.text( 3 ) <- "thirteen"
teen.text( 4 ) <- "fourteen"
teen.text( 5 ) <- "fifteen"
teen.text( 6 ) <- "sixteen"
teen.text( 7 ) <- "seventeen"
teen.text( 8 ) <- "eighteen"
teen.text( 9 ) <- "nineteen"
```

The text elements defined so far will allow conversion of any group to its English equivalent regardless of group number. After each group we must add a suffix to indicate, in English, which group number it is. We will limit the scope of numbers to the billions, although the algorithm will handle an infinite number of groups. Note that G(0) has no suffix, and as such is defined as a null string.

```
group.text( 0 ) <- ""
group.text( 1 ) <- "thousand "
group.text( 2 ) <- "million "
group.text( 3 ) <- "billion "
```

Now, referencing the symbols above, we will develop the algorithm to do the conversion. We will assume that we have already separated the target number into its groups, and that we will convert the number starting from the highest to the lowest numbered group. Of course, if the target number, N, is zero, we need do nothing, the output string becomes "zero" and the algorithm is not run.

Thus, the algorithm:

1. We must first set the group we are to convert to the highest group in our target number.
2. If this group has the value zero, that is Eh, Et, and Eu are all zero, we may proceed to step 8 there is nothing to convert for this group. Also note that no suffix is necessary either.
3. If the hundreds column of this group, Eh, is non-zero, then add to the output string unit.text(Eh), and the string "hundred." Note that the hundreds and the units column use the same text replacement without the suffix.
4. If the tens column, Et, is equal to one, then this is an exception. We must add to the output string teen.text(Eu). Note that even if Eu is zero, the replacement text is proper. Since we do not need to check for either the tens column or units column for this group anymore, we may proceed to step 7.
5. If the tens column, Et, is non-zero, then we must add to the output string ten.text(Et). We also know that the we will have to add a hyphen to prefix the text just added if the units column, Eu, is non-zero. So we will set the symbol hyphen to "-".

Otherwise, if Et is zero, then we know that a hyphen need not be added to the output string, so we will set the symbol hyphen to a null string.

6. If the units column, Eu, is non-zero, then add to the output string the symbol hyphen, unit.text(Eu), and a trailing space.
7. Add to the output string the appropriate suffix for the group number. If i represents group number, use the text group.text(i).
8. If this is group zero, the algorithm terminates. Otherwise, decrease the group number by one and return to step 2.

In order to make the algorithm more easily convertible to code, I have also included a representation of the concept in a notation that was used by Donald E. Knuth in Volume 1 of the Art of Computer Programming: Fundamental Algorithms, section 1.1. I have taken the liberty of making it "program" oriented, instead of mathematically oriented.

Algorithm C — Given any whole number N, convert it to its English translation. Start with i = n, where n is the number of groups in N.

[SEE PAGE 61]

I have also included a version of the algorithm written in BASIC V2.0 to verify its operation, and provide a working example.

"I know it looks silly, but I have yet to crash this system."

**ATTN: VAX SYSTEM MANAGERS**

By Terry Shannon  
System Manager, Galson and Galson, P.C.  
East Syracuse, NY

If any of you VAX system managers have wondered why your accounting reports make reference to the UIC (2,3) when you never created such a UIC, the following explanation of what this is and why it exists may be of interest to you:

In any VAX/VMS system configured for magtape, there is one — and only one — MTAACP (Magtape Ancillary Control Process, or device driver) available as a system resource. This ACP is called into a transparent system UIC (1,3) whenever a magtape related service or command is invoked. When not active, MTAACP is in hibernation to save on system overhead. Immediately after a dismount command is issued, MTAACP exits the system as it

is no longer needed. For reasons unknown to me, MTAACP manages to exit the system several milliseconds before VMS becomes aware of its absence. Because only one process can be active in any given UIC and because the MTAACP always is executable in (1,3), the lag time between the exit of MTAACP and the operating systems knowledge of the exit can lead to potential problems. Thus, when forced to exit, MTAACP reassigns itself to UIC (2,3) for the brief period of time required for the exit procedure. The accounting utility senses activity in this UIC and associates the CPU time consumed with the parent account which has used the MTAACP. In essence, the MTAACP is treated as a sub-process. From an accounting standpoint, the small amount of CPU time consumed by UIC (2,3) is attributable to system overhead. Below is an example of why the MTAACP functions in the manner described:

User A issues a dismount command, thereby forcing the MTAACP to exit the system, which it does almost instantaneously. At this time, VMS is not yet aware that the process is no longer resident. The next executable machine instruction is a mount request from user B which automatically invokes MTAACP in UIC (1,3). VMS senses the presence of user B's MTAACP and, because it has not recognized the exit of user A's process, assumes that it has two active processes in the same UIC — a situation which simply cannot occur. The end result is that the operating system issues an error message and, among other things, refuses to service user B's MTAACP by reassigning its exit procedure to UIC (2,3), the MTAACP effectively prevents this situation from taking place.

# A PRIDE [sic] OF EAGLES

By R.D. Mallery  
Publisher  
The DEC\* Professional

Being prone to practice what I preach, I recently acquired a pair of 'Eagles' for my '70. (cf Editorial, Vol. 2, #1)

Being both cheap and curious I decided to install them myself. I had an old H967 DEC rack available (they practically give them away surplus). I was delighted with the perfect fit I achieved (and the grand I saved for the cabinet).

Most disc factory manuals are very short on installation instructions. There are three major areas of concern:

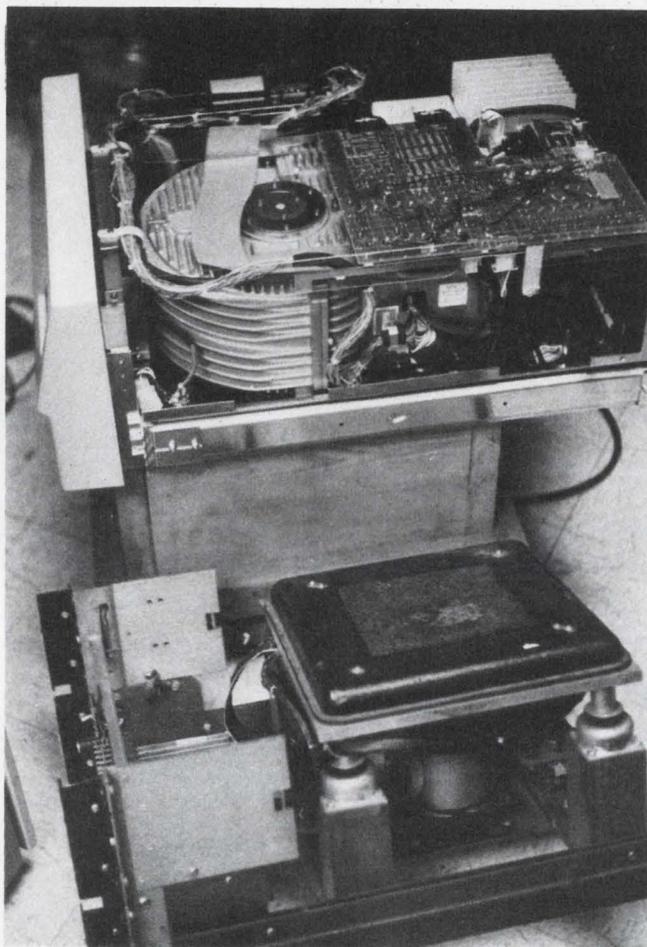

- 1) Physical installation in the cabinet.
- 2) Identifying and unlocking all shipping locks (no problem).
- 3) Getting the correct orientation of the cables (invariably a problem).

The actual physics of mounting the drive with its sliders on the cabinet is usually omitted entirely and left to the intuition of the installer.

Previous Fujitsu drives (160 MB) had splendid, obvious, easy to slide-off sliders. You slid them off, bolted them into the cabinet, then slid the drive in.

Not this time. After several hours of head-scratching, I was convinced that if there was an easy solution (one like the above, in which at least one rail of the slider remains on the drive to facilitate insertion), it was lost on me. A call to the vendor confirmed my fears. You unbolt the sliders from the drive, mount them in the cabinet, then use several strong individuals to hold the drive between the extended sliders while you bolt them back on.

The finished product speaks for itself. There are no adjustments, no alignment, none of the rituals involved with older discs. You don't have to format the pack, badging is already done, just run one pattern and go.

Thirteen years of disc technology! A DEC DS32 (32K 12 bit words for your PDP8) and my new Eagle (415 MB formatted for RSTS)

There are several shocks for the new owner. The first is when you power up the drives, there is almost no noise and almost no heat. In fact, the Eagle's power consumption is a joke. Under full flight, seeking like crazy, there is no vibration and almost no noise. (Sorry Carl, they don't click.)

The other shock comes when you actually load data into them. Your senses revolt as 12, 15, 20 reels of tape pour into them. Nothing that small

should hold that much data!

The controller manufacturer supplies patches that make INIT.SYS believe that Eagles are large RM05's (with 830,000+ blocks). All the rest of RSTS goes along with whatever INIT.SYS thinks, except for a single patch you must make to each monitor SIL you generate. They supply a pre-patched version of INIT on a bootable tape, leaving you with only a single patch to make after you SYSGEN.

With little ceremony, we powered down three 9766's that had been spinning for four years. Noble drives, almost perfect, but their time has passed. The change was immediate. The room became about ten degrees colder. The whine in the electric meter went down in pitch. I expect to save a grand a month between electric (and air conditioning) and service charges . . .

The last, and perhaps the best part is performance. The 9766's (RM05's) transferred at 1.2MB/sec on the mass bus. They sought at 33ms. The Eagles transfer at 1.8 MB/sec and seek in 17ms. This has to be classified as 'substantially' faster. In my installation, going from three drives to two, I gave up a little performance offered by the third set of heads. I am sure the new-found speed will more than offset the loss.

# DEC PLOTTING PACKAGES

FROM

# APPLIED GRAPHICS SYSTEMS

## OMNIGRAPH

Calcomp emulation with ten basic FORTRAN calls for plotting.

Supports VAX VMS, and PDP RT-11, TSX, RSX11M Operating Systems.

Device drivers available for Printronix, IDS PRISM 80, 132, Decwriter IV, Printacolor, Epson MX 80, 100; ISC 8001G, ISC 8001I.

## TEKPLOT

Tektronix PLOT-10 TCS graphics emulation with 91 FORTRAN subroutines for complete graphics capabilities.

Supports VAX VMS, PDP RT-11, TSX, RSX11M and Data General Nova RDOS operating systems.

Device drivers available for MX80, 100; Printronix; Decwriter IV; Printacolor; and IDS PRISM 80, 132. An interactive version is available on the ISC 8001I color graphics terminal

# AMBASE, THE MAESTRO, FOR PERFECTLY ORCHESTRATED DATA.

Maestro... in music, and AMBASE in data management demonstrate expert capabilities in orchestrating quality results from complex interactions. AMBASE converts a variety of data, from multiple sources, into meaningful and useful formats; just as the Maestro transforms the talents of many musicians into symphonic perfection. Both are internally complex, yet outwardly simple.

In the complexity of business management, Amcor's DBMS/Development Tool, AMBASE, can simplify your data management tasks. Amcor's Data Maestro streamlines your D.P. operations by relieving much of the drudgery of writing programs. Some Amcor customers complete 90% of their programming utilizing two AMBASE code generating utilities, which yield 40%-100% of the finished program.

Designed for DEC\*, PDP11/RSTS and VAX/VMS computers, Amcor software fine-tunes productivity.

AMBASE provides the sophisticated theme around which our Business Control and Accounting Systems have been arranged. This unique data base structure provides flexibility and easy modification to these Business Applications.

Productivity Tools like the Report and Screen Generators, Query Facility, plus the user-friendly Report Writer complete Amcor's software symphony which can help your business reach a dramatic crescendo of profits.

Let Amcor help orchestrate your success with a medley of classic software solutions, a broad program of documentation, training, customer support and a finale of DEC\* computers.

To find out why, after an introduction to the Amcor Overture, many of our customers request an ENCORE, complete and mail the coupon today. If you prefer, call 800-626-6268.

**Introducing the  
money-making  
micro-mini  
DEC<sup>TM</sup>-UNIX<sup>TM</sup>-CP/M<sup>TM</sup>-MUMPS<sup>TM</sup>  
universal 16-bit  
workstation.**

**(Whew!)**

If you're selling small business systems and software, you're leaving money on the table.

Because you could pick up a lot more of what we're all here for with the Plessey Series/6000 Small Business Computers.

## Your business is our business.

With the 16-bit Plessey Series/6000, we've made it our business to support your business.

Our computers are based on DEC's LSI-11™ micros, so you start with proven hardware that's in thousands of systems world-wide.

We've made them available in a wide range of configurations, so you can provide exactly the power your customers need.

Start with the low-cost System 6100, a 64 kbyte single-user workstation. Or for multi-users, choose the economical System 6200 with 256 kbytes of main memory (expandable to a full megabyte). Both use the Q-bus and come in a compact 5¼" chassis available in desktop and rackmount configurations.

And for the big jobs, go to our System 6600 and System 6700 to get the full power of a 22-bit minicomputer. From 256 kbytes to 4 megabytes of main storage. An 84 megabyte 8" Winchester disk. Q-bus for communications and other peripheral interfacing. And all in a 10¼" chassis at a price that's easy to take.

Or choose anything in between, with or without floppies, hard disks, streamer

tapes, terminals, communications and any peripherals you need. (Peripherals are also available alone.)

All the Plessey Series/6000 computers support whatever you're doing (or will be doing) in software: DEC operating systems like RSX-11M/M+,™ RSTS/E™ and RT-11™ or TSX-Plus.™ UNITY™ (System III UNIX) and the new crop of software. M-11 (MUMPS) and hordes of public domain applications. And even CP/M and all those low-cost programs.

You can use BASIC, COBOL, DIBOL™, C, PL/I, FORTRAN and MACRO™ languages.

And the programs you develop on the single-user system are just as useful on the most powerful Series/6000 configuration, so your customers have an easy growth path.

## The bottom line.

Plessey Series/6000 Small Business Computers are a quick way to improve your profits because they're reliable, versatile and cost up to 30% less than the DEC equivalents.

And they'll reduce your after-sale headaches because they're supported by our own international sales and service network.

For more details, contact Plessey Peripheral Systems, 17466 Daimler, Irvine, CA 92714.

Or better yet, call (800) 854-3581 or (714) 540-9945 in California today. Because we all know that time is money.

# UNIX CONSIDERED

By Barry Shein and Steven Sneddon

## INTRODUCTION

UNIX is a general purpose, multi-programming environment written by programmers for the purpose of software development. Dennis Ritchie and Ken Thompson, who first designed UNIX at Bell Laboratories, described UNIX as follows:

It offers a number of features seldom found even in larger operating systems, including

- (i) A hierarchical file system incorporating demountable volumes.
- (ii) Compatible file, device, and inter-process I/O.
- (iii) The ability to initiate asynchronous processes.
- (iv) System command language selectable on a per-user basis.
- (v) Over 100 subsystems including a dozen languages.
- (vi) High degree of portability.

This last feature has led to its proliferation on hardware as diverse as the PDP-11, VAX, MC68000 and IBM/370 computers.

## HISTORY

The first version of UNIX ran on a PDP-7 computer at Bell Labs and shortly thereafter migrated to a PDP-11/20. The very first system was written by Ken Thompson and later versions were developed with Dennis Ritchie both of Bell Labs. The basis for the current time-shared system (PDP-11/34 et al) was completed in February 1971. This came to most of us as UNIX Version 6 and is still very popular. The later versions (V7, system-3) are oriented more towards the larger PDP-11 configurations (45, 44, 70, VAX) but can be run on the smaller processors without too much difficulty.

At the high end UNIX is being run at Bell Labs on an IBM-3033 processor giving service to as many as 300 interactive users.

A popular variant of UNIX is the PWB (Programmer's WorkBench) which is an augmented Version 6 sup-

porting a host of utilities for management of large software projects.

A recent development of UNIX has been its appearance on personal computers. Several versions are available for the MC68000 and Z8000 processors. The natural migration of UNIX from the PDP-11/34 to the LSI-11/23 makes it likely that UNIX will be very popular among the new generation of DEC Professional computer users. The multi-programming environment and ability to network to host UNIX systems make this highly attractive.

In addition to the Bell Laboratories' version, the University of California at Berkeley and several manufacturers offer enhanced UNIX systems with such features as real-time processing, advanced text processing, graphics and data base managers.

## SHELL

To a user, the most visible portion of UNIX is the command interpreter called the 'shell'. Rather than being part of the kernel, the shell is an application program. Each user's entry in the password file specifies the program that is initially run at login.

The standard UNIX command shell is in many ways similar to the DEC command languages, with a few powerful additions. The shell splits up its input into a command name and arguments to that command. The command is almost always the name of an executable file. If the file is in the current directory the shell attempts to execute it; otherwise it searches standard system directories for it.

To illustrate basic use of the command shell, suppose we wish to sort two files using defaults:

```
sort filea fileb
```

The files would be sorted together and the result printed on the terminal. The sort program receives the specified names and would be responsible for checking their validity, etc. One option of the sort utility is to reverse the order of sorting:

```
sort -r filea fileb
```

Hyphenated arguments, by convention, specify options to programs.

Often we do not wish to see the output of the sort on our terminal. By default, the output of 'sort' appears on the terminal, the 'standard output.' However, the shell can 'redirect' the standard output to a file:

```
sort filea fileb > sorted
```

Similarly, input can be redirected from a file by '< file.'

The natural extension of I/O redirection occurs when one program's output is passed to a second, asynchronous process. UNIX provides a mechanism for this, the 'pipe'.

To illustrate a pipe, suppose we wished to remove all lines with duplicate sort keys before placing them into the 'sorted' file. There is a utility called 'uniq' that does this:

```
sort filea fileb | uniq > sorted
```

As a further example, we might want to know the number of unique lines. we could accomplish this by typing:

```
sort filea fileb | uniq | wc -l
```

The last command, 'wc -l', simply reports the number of lines in its standard input.

These examples illustrate how UNIX turns programs into something akin to a good subroutine library in a programming environment.

There is no separate batch facility on UNIX but a program can be run in the background by terminating the command with an ampersand thus:

```
sort file > sorted &
```

executes the sort in the background.

The shell can be invoked, just like any other program, and can take commands from a file. In effect a batch stream can be set up by placing a series of commands in a file, e.g., 'batch', and executing the shell in the background:

```
sh batch &
```

Shell files may also contain control-flow primitives and string-valued variables making the shell a programming language as well as a command interpreter. There are (in newer shells) command aliasing,

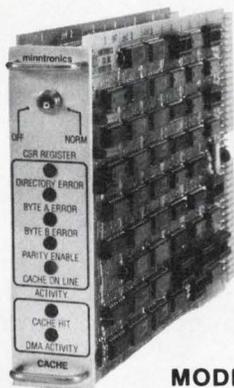

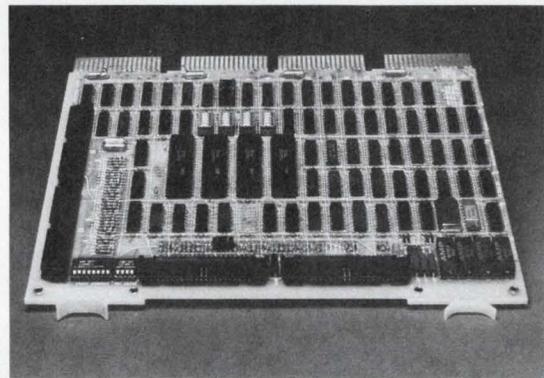

# ATTENTION: LSI-11 USERS NEW! ANNOUNCING THE INDUSTRY'S DENSEST 8-CHANNEL SERIAL COMMUNICATIONS COMPATIBLE REPLACEMENT BOARD FOR THE DEC Q-BUS DZV-11: THE OCTOMUX!™

Visit us at <b>DEXPO™ East 83</b> Kiel Auditorium St. Louis, Missouri May 22-24, 1983
<b>Booth</b> 121

Are you currently using the DZV-11, or its equivalent, for hooking up terminals to your LSI-11? If you like the DZV-11, you're going to love the Minntronics OCTOMUX. If you like having four ports on the DZV-11, you're going to love having eight ports on the OCTOMUX. If you like the small, quad size of the DEC DZV-11, you're going to love the even smaller, dual-height size of the OCTOMUX. Yes, that's right! Twice as many channels in half as much space as the DEC DZV-11. Please call/write for free, no-obligation literature and the nearest sales representative or distributor.

## ■ NEED PERIPHERAL I/O PORTS?

Like the idea of four DL-11A, B, C and D's on ONE quad-height board at a fraction of their cost? The DL4-11 is just for you. Need MODEM CONTROL? The DL4-11E is exactly what you need — and on a standard size quad board, too. Both versions install in a single SPC slot and provides *both* current loop and E.I.A. RS-232C on the *same* board. Talk about flexibility! And if that isn't enough, the DL4-11 and DL4-11E provide 19.2K baud operation, in addition to the standard DL-11 speeds. And there's more. Naturally, coming from Minntronics, these products have valuable features not available anywhere else at a price that's more than competitive.

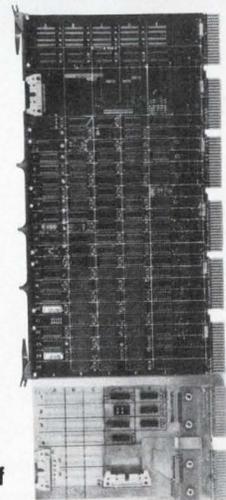

**MODEL 8034/40AP**  
8KB CACHE FOR PDP-11/34, 11/34A,  
11/35 & 11/40. INCREASES  
SPEED BY 20-50%!

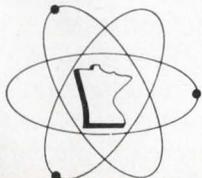

## ■ NEED MORE SYSTEM SPEED?

Do your programs take too long to run? Want to add more timeshare terminals onto your system, but can't because response time would be too slow? One of our cache memories may be just the answer for you. They're simple to install and maintain because they're completely pluggable. Easy to use because they require no software changes. As a matter of fact, they have NO impact at all on your system EXCEPT to make it run faster — A LOT FASTER. Typically 30-70% for the PDP 11/45 and 20-50% for the PDP 11/34, 11/35 and 11/40. It won't affect your DEC service contract, either. And last, but not least, they provide the highest quality, because they are built by the very same people who invented the FIRST pluggable cache memory, for the PDP 11/45, in 1974. We've worked smart and hard to keep it that way since then.

**MODEL 8045P**  
**CACHE FOR**  
**PDP-11/45,**  
**11/50 & 11/55**  
—  
**INCREASES**  
**SPEED BY**  
**30-70%**

**NEW!**  
Model 8045P has 4  
times the memory of  
older caches.  
— 8K BYTES!

variables, local and global environments to specify such things as type of terminal you are on and the default libraries to search. Application programs can access these environment descriptors so programs can execute appropriately. Good examples of this are the Berkeley terminal programs which use a data base of terminal descriptions to automatically tailor screen editors, output filters and other applications to the type of ter-

minal the user is currently on. An environment variable is simply set at login (or automatically from a login shell script.)

Similar to DEC command languages, there are facilities for specifying files with wildcards. They are:

- 1) \* matches any string
- 2) ? matches any single character
- 3) [c1...cn] matches a single occurrence of the specified characters.

## DEVELOPMENT ENVIRONMENT

Central to the UNIX philosophy is the importance of software tools. Separate utilities, each performing a single job well, were preferred over a few large programs with many options. The system 3.0 UNIX user's guide lists over 200 general purpose commands. Among these are:

**Editors** — Line, screen and stream editors all using a common pattern matching syntax for search and replacement.

**File Management** — Recursive directory search by owner, type, access, name etc. allowing the application of any command to matched files. Pattern search and replacement on groups of files. Sort, merge, split, archiving and user backup are provided.

**Word Processing** — Programmable formatters and macro libraries for devices as diverse as letter quality printers and phototypesetters. Preprocessors for generating equations, tables and graphical output. Spelling checkers based upon dictionary and statistical methods.

**Software Project Management** — A source control system for maintaining multiple versions of programs. Conditional system generation based upon modifications and varying targets.

**Languages** — C, FORTRAN, FORTRAN77, BASIC, BASIC+, LISP, ALGOL, SNOBOL, APL, PASCAL and assembler.

**Compiler Development** — Compiler-compilers, a lexical analysis generator.

**System Maintenance** — Accounting, file system repair, device management and incremental backup.

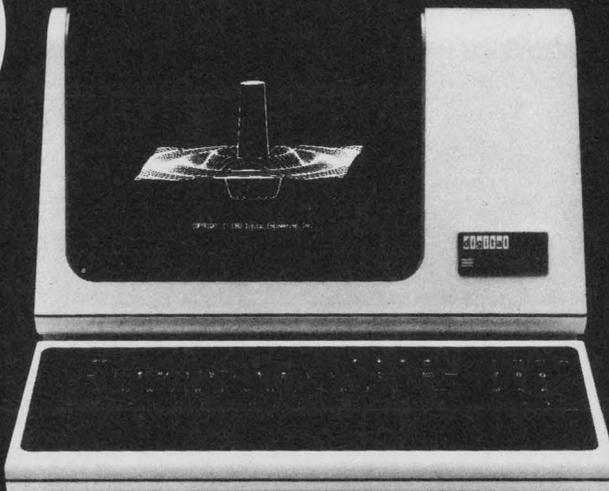

**Miscellaneous** — Graphics, forms, games, networking, circuit design and data base utilities.

## PROGRAMMING ENVIRONMENT

Another attractive feature of UNIX is its program development environment. This is particularly true for the C programmer since C is the native language of the operating system and

CIRCLE D152 ON READER CARD

the language in which most of the utilities are written. UNIX provides a layered environment at the bottom of which are system calls which handle file management, process management and unbuffered I/O. At the next level are portable routines for implementing buffered I/O, math routines, graphics packages, etc. At the next level is the ability to execute other programs and use their results. Finally there are program generators and systems for project management and system regeneration.

Even at the lowest level, UNIX system calls provide flexibility for the programmer. For example, when issuing a read call you do not need to know in advance physical device characteristics.

```
n = read(file,buffer,nwanted)
```

Read returns the number of bytes actually placed in the buffer or zero for end of file.

As an example of making use of another program within a program, assume that the variable 'infile' holds the name of a file to be sorted and 'outfile' is the name of a file to receive the sorted data:

```
sprintf(cmdbuf,"sort %s >
%s",infile,outfile);
system(cmdbuf);
```

Sprintf() formats the command into 'cmdbuf' and system() invokes the shell with the command and waits for completion.

A few examples at the higher level of software development are:

YACC and LEX, compiler development tools. YACC accepts a BNF-like input and produces a C program to parse the specified grammar. LEX accepts regular expressions and generates a lexical analysis program which is often used in conjunction with YACC output.

Lint checks C programs for portability and questionable constructs reporting potential bugs such as unreachable code, unportable type coercions and inconsistent usage of function parameters and return values.

MAKE automates rebuilding system software by allowing the

user to specify dependency relationships between source and object files leading to the desired result. MAKE then issues the minimum number of commands necessary to regenerate the target file.

SCCS is a system of programs for managing different versions of source files, recording changes of modules. SCCS can recreate earlier versions of the software and offers various audit and administrative features.

### LIMITATIONS

Along with its many strengths UNIX also has some weaknesses. Primarily these are due to intentional design omissions since they would incur degradation of performance and/or simplicity. Some obviously lacking features are:

- a) Real time services.
- b) Contiguous files for better disk throughput.
- c) Shared core, file locking.
- d) Record oriented access methods.
- e) Security against a hostile user community.

Augmented UNIX systems which provide these features are becoming available from independent software vendors, in part due to the availability of complete sources from Bell Laboratories.

### SUMMARY

UNIX is a well designed, highly integrated software development environment. The operating system provides a high degree of portability of both people

and software between many diverse machines. Owing to the support of Bell Laboratories, the academic community and several commercial software houses UNIX is growing rapidly in popularity on DEC and other computer systems. UNIX is not the final word in operating system design, but it has set a standard against which others will be judged.

# Get a dramatic performance from your DEC Computer.

Contel software can improve the performance of your DEC system while reducing your programming costs. Our repertoire of proven software products can simplify database management, deliver multi-user, distributed processing and networking capabilities, add word processing to every terminal, even expand operating system capabilities. For example:

**RTFILE®:** Interactive, relational database management system for menu-driven, forms-oriented data processing without programming.

**SHARE-eleven:** High throughput, memory-resident timesharing system which supports up to four users.

**TSX-Plus:\*** Comprehensive, disk-swapping timesharing system which can support as many as 20 local and/or remote users.

**STAR-eleven:** High-performance local area networking system which links multiple PDP-11 and/or LSI-11 computers for resource sharing and distributed database processing.

**LEX-11:** Powerful word processing system with more functionality than the stand-alones and the flexibility of the DEC environment.

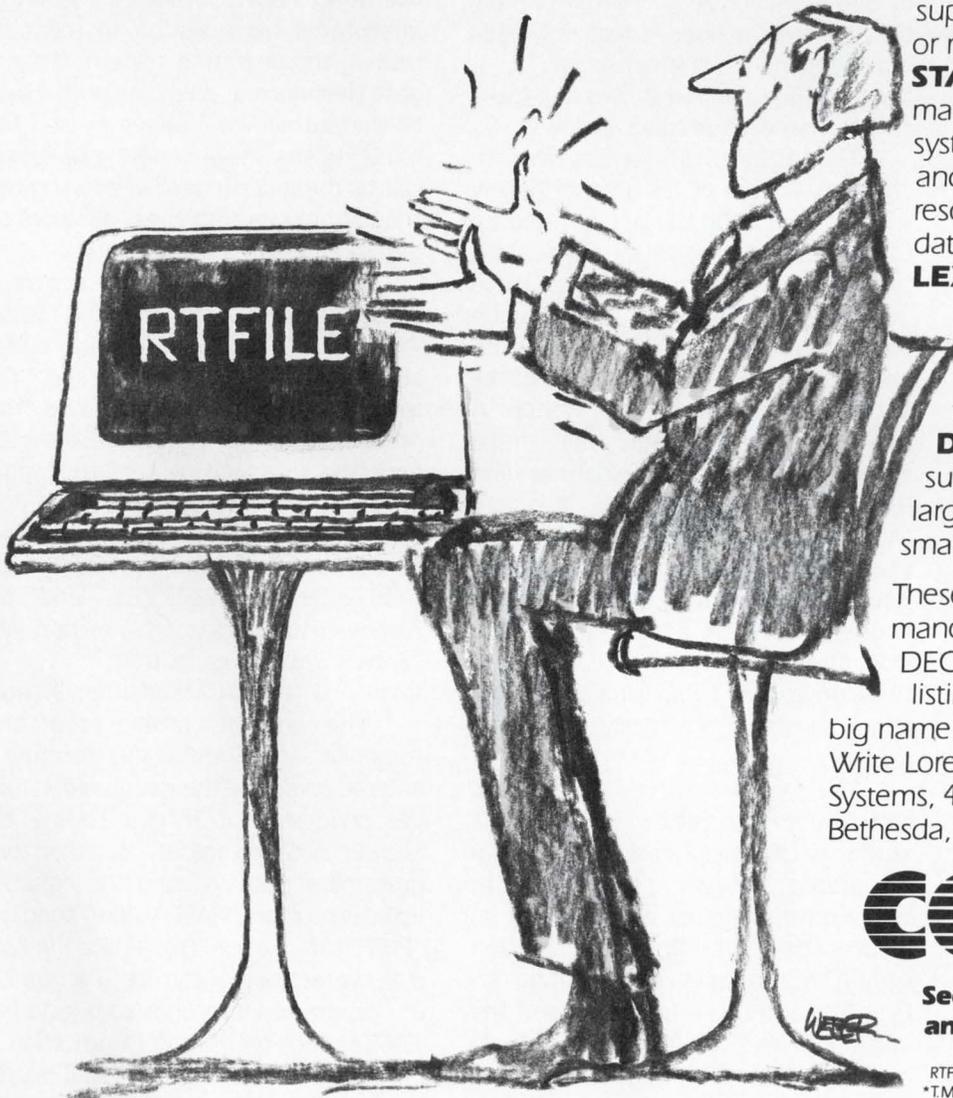

**DISKS-eleven:** Field-proven sub-device utility which divides large disks into any number of smaller virtual disks.

These and Contel's other performance packages can enhance your DEC computer. Get the complete listing by contacting Contel, the big name in small systems software. Write Loretta Kane, Contel Information Systems, 4330 East-West Highway, Bethesda, MD 20814, or call 301/654-9120.

# A BAD REVIEW FOR A REVIEW

By Roger Brown, President, Interactive Technology, Inc.

(Editor's Note: The following correspondence was too long for inclusion in our "Letters to the DEC PRO" section. Because **The Dec Professional** wishes to be fair to all its readers and advertisers, we are publishing this letter unedited. Again, we are publishing this letter in fairness to ITI. It is not the intention of this magazine to get into a "who struck John" situation.)

**SURPRISED** and **DISAPPOINTED** are the words that best describe our reaction to the article in the March, 1983 issue of The DEC Professional entitled "A Review of Database Management Systems for RT-11". We at Interactive Technology, Inc. of Portland, Oregon, filled in a questionnaire that served as the basis of the article. We completed the questionnaire in response to the author's statement that, "I have been approached by The DEC Professional magazine to write an article comparing those commercially available DBMS which run under RT-11." Since we did not recognize Logicaid, Ltd. as a producer of a product in that environment and because they have not appeared as advertisers in The DEC Professional since its inception, we participated in the study, believing it was truly independent and sponsored by your magazine. We were then quite surprised to find that the resulting article covered only three of the systems available and that the article included a product produced by the author's company.

Several aspects of the article suggest to us at ITI that the author is perhaps less than qualified to fully analyze the products and that the author's review of the questionnaire was insufficient if not blatantly superficial. By not carefully reviewing articles like this, you, as publishers of the article, perform a disservice to your readers.

We were disappointed to find that the article only covered three products, two of which have been prominently advertised in your magazine as well as others and displayed at industry shows. We wonder why other products having comparable exposure were not reviewed, yet we must accept the

author's explanation that other product reviews were either not received or arrived after the deadline. It is interesting to note that the two independent products reviewed are produced by companies in cities distant from the author: Portland, Oregon and Bethesda, Maryland. We can't help but note the omission of "Simile," produced in New York. Did the producers of Simile recognize the author simply because they realized it was not really an "independent product review"? because they realized it was not really an "independent product review"?

The author rationalizes the incomplete nature of his product review simply by pointing the lack of response to his questionnaire within the allotted time. For your information, Interactive Technology received the questionnaire on December 20, 1982 and was requested to return it to the hands of the author by January 15th, 1983. A period marginally longer than three weeks, including the Christmas and New Year's holiday periods. If in fact the author's response was light, it may very well have been significantly influenced by his lack of prior planning and not providing adequate time. We were disappointed to find such a superficial review in your magazine, for which we have previously had much respect.

The "vendor survey" techniques elected for this review provided the author with a great deal of specific information; however, as is true with many questionnaires, the author's interpretation of that information significantly shapes the resulting article. The author's interpretation of the questionnaire's results leads us to question both his diligence and his technical knowledge. Specifically, the

author chastises the two independent vendors for claiming that their systems operate in less than 64Kb of memory in a standard TSX+ system. In fact, it appears that both independent vendors answered the question of "What is the minimum memory required for the single user facility?" by indicating the memory requirements for the vendor product **exclusive** of the operating system, whereas the author interpreted his question to mean including the operating system. We suggest that normal diligence on the part of the author would have caused him to clarify the answers with a telephone call to the independent vendors rather than simply writing these answers off with a sarcastic comment.

An additional example occurs in the questionnaire section titled "DBMS AND FILE STRUCTURE". The author submitted a question that asked, "Can a data item's value be calculated from other data items? If so, please explain how the user causes this to happen (does he enter a formula, what does the formula look like, etc.)? In the case of our product, our response to the first question was **YES**, and our response to the second question was "enters formula as follows:  $Item = (1 + item\ 2 / \sqrt{(item\ 3)})$  etc."

The author interpreted this response as a "PASCAL-like formula is entered to define the calculated value." We suggest that if you review the answer with technically qualified programmers, you will find the equation listed is no more "PASCAL-like" than it is "FORTRAN-like" or "BASIC-like". In fact, it is syntactically incorrect in a number of programming languages-including PASCAL. For presenting information to both technical and nontechnical people, we believe a more accurate translation

would have been an "algebraic-like equation," which in fact is the case. If the author had sufficient technical competence to recognize the answer as not specifically a language response, or had the author been reviewing it in an unbiased fashion, his conclusion would have been to either question the vendor or to interpret the answer as an algebraic equation, something far more broadly understood by the population than a specific programming language syntax.

Should you at this point need additional basis for questioning the "independent" nature of this review, I direct your attention to the second paragraph of the article which stresses in sentence two that "the DBMS should be thought of as a tool used in building a final application." With this idea in mind, we believe the author's treatment of the screen and menu support section, which he glibly writes off as "technically not a DBMS function," is a substantial disservice to your readers. The vast majority of data management systems uses screen input forms as a primary data input mechanism. Why then does the author reserve less than half a page for screen discussions, not treat the ability to create menus and commands at all, and yet use nearly a full page to talk about report generation and a second full page to talk about DBMS integrity? All four subjects probably warrant equal treatment for the true application development user. It appears more than coincidental that the treatment of these features corresponds directly with their absence in the author's own product.

Lastly, I draw your attention to the pricing and conclusion section of the article wherein the author disclaims any accurate comparison of apples to apples on the basis that "the prices stated are for complete "bundled" systems." While he disclaims any responsibility to present comparative information, the author summarizes the cost of the various systems in an extremely distorted fashion. On the questionnaire provided, the author was informed that the RDM system was priced at \$2500 and that additional extensions were available for an additional \$2500. The author chose to add the total for presentation

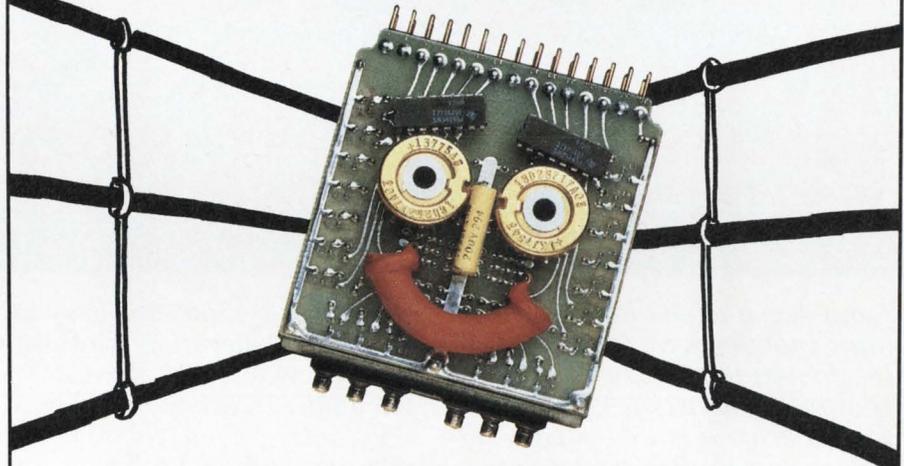

rather than list the comparatively accurate price of \$2500 or question the vendor. The fact is that the complete RDM package — including not only file creation, report writing, and file maintenance capabilities but also full screen development, command and menu development, and process definition capabilities—is all provided for \$2500 in RT-11, TSX+, RSX, POS, or the RSTS/E operating system versions. ITI provides an additional PASCAL library to programming organizations for enhanced programmer productivity.

Misrepresenting the product and its pricing does your readers a disservice. We at Interactive Technology are extremely disappointed by the lack of a careful review of the article and its authors qualifications.

Again, my purpose in writing is to draw your attention to the significance of complacency in article publication. We applaud the breadth and depth of The DEC Professional as a magazine, and we hope you will accept this letter in the spirit of constructive criticism with which we write it.

If your DEC system is down for the count, call us. We maintain your processors and associated peripherals; get them back in fighting trim quickly. You'll get complete service as well as preventive maintenance. Just what you'd expect from the largest independent supplier of computer peripherals in the world.

**GD CONTROL DATA**

*Addressing society's major unmet needs  
as profitable business opportunities*

CIRCLE D94 ON READER CARD

# From out of the West... Leadership in disk controllers

*Long recognized as the dominant independent tape controller company serving the mini-computer industry, Western Peripherals has extended this leadership to disk controllers.*

The industry measures leadership **by the numbers**. Western Peripherals has the largest installed base of independent peripheral controllers operating in the field today. Products include disk and tape controllers for DEC, Data General and Per-

kin-Elmer computers. They include controllers for Winchester and removable disk drives, streaming, start-stop and cartridge tape drives. No other supplier has as broad a line.

**Western Peripherals makes the numbers count.** Leadership in performance and reliability. All Western Peripherals controllers have multiple drive support capability and are software transparent to the host computer. All feature extensive self-testing, as well as the industry's

highest reliability — *over 45,000 hours actual (measured) MTBF.*

And leadership in product availability, delivery, service and support. Western Peripherals controllers are available either separately or as a complete, fully tested subsystem. They are supported by a full year factory warranty and a national field service organization. In most cases availability is 30 days ARO.

Find out how much our leadership can mean to you.

# PROGRAMMING THE FLOATING POINT PROCESSOR (or, those Ferocious Floaters . . .)

By Bob "Macro Man" Meyer, Fieldsboro, NJ

Greetings, MACRO fans.

In this article I'll describe the basics of the KT-11 floating point processor, talk about its instruction set, and show some (simple) programming examples of how to use it. (In MACRO, of course . . .)

## INTRODUCTION

The FPP can do wonders for your CPU. It's basic purpose in life is to carry out large (15 or 31 bit) signed integer calculations, as well as 23 or 55 bit floating point goodies. It's quite fast, so I'm told (you may look up timing information in the 11/70 processor handbook) and it operates in parallel with the CPU itself. I found this a bit confusing at first, but it's really quite simple; only FPP instructions can access the FPP'S accumulators (six available to the user, each 64 bits wide), so the program can execute an FPP instruction, go do something else for a few fractions of a second, and go back to fetch the results of the calculation. If the FPP hasn't finished the requested operation, the hardware will 'hang' the CPU until the FPP has finished. This sounds pretty clever, but I seriously wonder if anyone has ever written software with this in mind . . .

Some of the FPP'S claims to fame are its full set of addressing modes (like the PDP-11), ability to access any location in memory, (or any general register), complete set of data conversion instructions, error detection and trapping, full 64-bit add, subtract, multiply and divide, its own set of condition codes which can be tested and compared, exponent handling instructions, and mode control instructions. (Whew . . .)

The FPP operates on integers in one of two modes, integer or long integer. While operating in integer mode, instructions which convert data between integer and floating formats will treat the integer data as if it were 16 bits long. When in long integer mode, the data will be handled with 32 bits. The desired mode should be selected before any processing is done by the user. This is done with the instructions:

SETI

which sets the processor to integer mode (16 bits), and

SETL

which sets it up for long integers (32 bits).

Before I forget, any attempt to execute FPP instructions on a machine without an FPP will result in a Reserved Instruction Trap; various operating systems will handle this in different ways.

## INTERNAL FORMAT

Floating point numbers, like integers, are operated on in one of two modes: FLOATING (SINGLE PRECISION) mode, which provides 23 bits of fraction (plus one hidden bit which we'll discuss in a moment), eight bits of exponent, and one sign bit; or DOUBLE PRECISION mode which gives us 55 bits of fraction, eight of exponent and a sign. To place the processor in floating (single precision) mode, use the instruction:

SETF

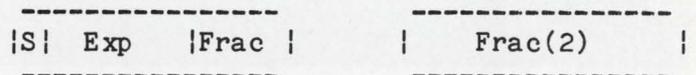

or if you need lots of digits, execute:

SETD

which places the processor in double precision mode. (These FPP states are (usually) preserved by the operating system during timesharing so that each user may 'tailor' the FPP to his/her needs.)

Next we'll talk about the internal data representation. Not being a "math heavy" by nature, I found this a bit complicated at first, so I consulted MY guru, the amazing 'Dr.' Jude Suszko, to untangle my aching brain cells.

Refer to the following diagram (you might find some better art work in the processor handbook chapter on the FPP) for the following discussion.

Where:

S is the sign bit for the entire number

Exp is the 8-bit exponent

Frac is the first seven bits of the fraction, and

Frac(2) is the remaining 16 bits of the fraction. (Note that when using double precision mode, two more words of fraction will be added, giving a total of 55 bits for the fractional component of the number)

The 'hidden bit' we spoke of earlier is a bit that is always present (unless the entire number is zero, in which case nothing is stored), and therefore is NOT stored in the internal representation of the number. Let's talk about this with an example. The number 1 (decimal) is stored internally as 40200 (octal) in the FPP (you math majors, please bear with me). If we break this down into binary, we get:

```

0 4 0 2 0 0   Octal
0 100 000 010 000 000   Binary

```

. . . to page 82

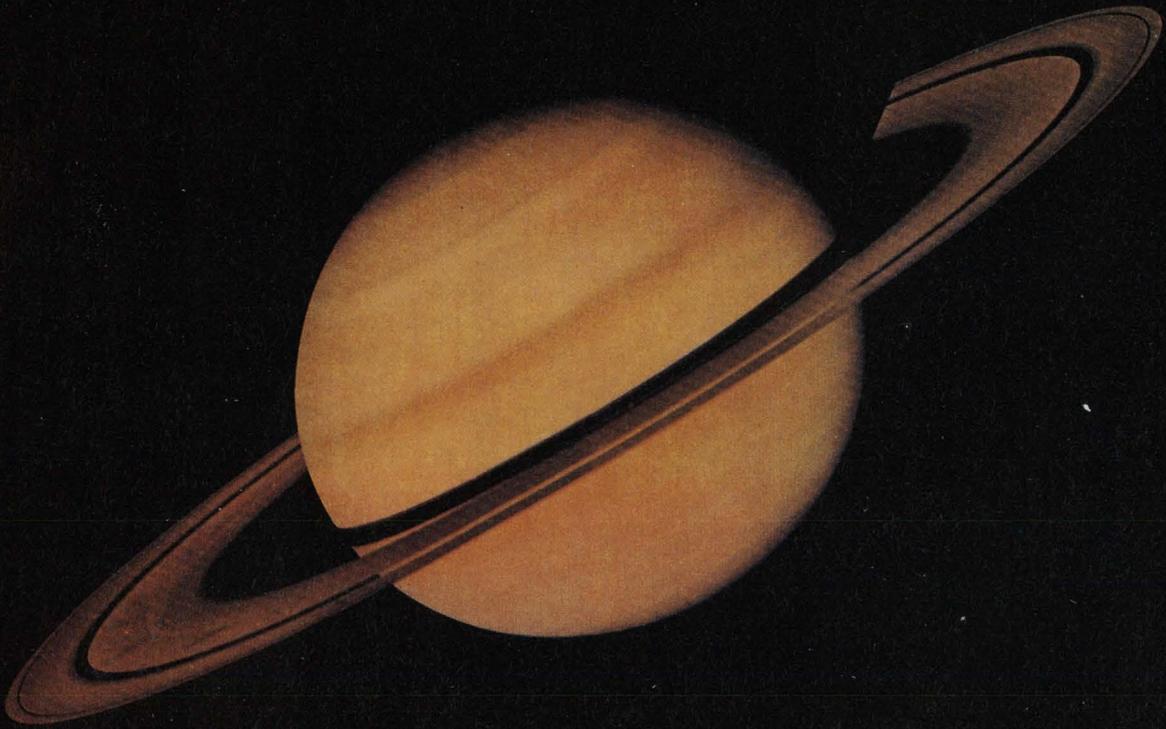

# Nowhere on Earth...

can you find the ideal software for your  
DEC computer.

Many word processors and electronic spreadsheets take up too much memory space on your system. Or they operate so slowly that you waste valuable time. And when you have a problem there is no one to call for help.

# Come to Saturn for the answer

## ***Word/List Processing***

Installed at more than 1,000 locations worldwide, WP SATURN<sup>®</sup> is the answer to your word and list processing needs. A full range of editing and formatting commands allows you to produce top quality documents with minimal effort. List processing data can be merged with WP files for mailing lists and personalized letters.

## ***Electronic Spreadsheet***

SATURN-CALC<sup>®</sup> is a powerful and flexible electronic spreadsheet. A masterpiece of simplicity, it can be used by everyone in your office. And because WP SATURN and SATURN-CALC both use standard ASCII file structure, spreadsheets can be merged with WP files to produce boardroom quality reports.

## ***Efficient and Friendly***

Clear, concise documentation and on-screen help text assure rapid learning and encourage users to take full advantage of the systems' capabilities. Commands consist of regular letters of the alphabet, eliminating searches for unfamiliar keys. Both systems were written in assembly language to maximize efficiency and minimize use of memory space.

*Dial our toll-free number for a demonstration that will open your eyes to a new world of office automation software.*

CIRCLE D209 ON READER CARD

Now we separate the bits into FPP format:

0		100 000 01		0 000 000
^		^		^
!		!		!
!		!		!
Sign		Exponent		Fraction
0.		129.		0.

Now let's take a look at what we have; The sign is zero, making the whole number positive. The fraction is zero, but when we add the 'hidden bit', we get:

.1 (binary)

The exponent is 129., but this is 'excess 128. notation', therefore 128. is subtracted from the exponent, giving us an exponent of 1. (this way exponents never go negative).

We use the exponent (1.) to move the binary radix point to the right. So our example goes from:

.1

to

1.

which is the correct value for the number 40200 (octal).

Now let's take the number 40300 (octal), (which I know to be 1.5 decimal ('cause I'm Macro Man and you're not, so there)) and break it down into internal format.

First we get it in binary again:

0	4	0	3	0	0	Octal
0	100	000	011	000	000	Binary

Now into internal format:

0		100 000 01		1 000 000
^		^		^
!		!		!
!		!		!
Sign		Exponent		Fraction
0.		129.		1 (binary)

Ok, the sign is still zero, indicating a positive number. This time we have a fraction of 1 (binary); this gets positioned AFTER the hidden bit, giving us:

.11 (binary)

We convert our exponent into decimal, which gives us 1, and move the binary point that many places to the right. Now we have:

1.1 (binary)

Which, in decimal is 1.5 (numbers AFTER the binary point have values of .5, .25, .125, and so on . . .)

The decimal number 1.25 would be 40240 octal, and in binary:

1.01

after the binary point is moved.

The number 2 would be 40400 in octal or:

10.0

in binary.

**INSTRUCTIONS**

Most of the instructions in the processor handbook will be displayed with two mnemonics, some even with four.

# Put a little tape backup in your DEC microcomputer.

SMS' DSX-11 is a complete DEC microcomputer with 80Mb Winchester and 1/4" cartridge tape backup. With over 20Mb per tape cartridge, Winchester backup has never been so easy. Emulating DEC's latest TS11 tape device, standard RT-11 and RSX-11M software makes disk backup, system boot, media interchange, archiving and software distribution a snap!

256Kb main memory (expandable 4Mb)

Expansion space for 15 dual height modules.

LSI-11/23 16 bit CPU with memory management.

4 Serial ports.

Advanced disk controller with ECC, flaw management, bootstrap, error retry and non-interleaved data transfer.

PDP-11\* architecture compatible with RT-11, RSX-11M and UNIX\*\* software.

17.8Mb, 35.6Mb or 71.2Mb Winchester disk.

Self test with LED display of system faults.

Start/stop tape supports file operations.

Compact 3M Cartridge.

TAPE CONTROLLER ONLY AVAILABLE FOR VOLUME REQUIREMENTS.

The various mnemonics for the same instruction all generate the same machine code, however they do make the assembly code a bit easier to read. For example, if you were operating the floating point processor in floating (single precision) mode, and wanted to load one of the floating point accumulators, you would use the

LDF (load floating)

instruction, rather than the

LDD (load double)

instruction, indicating to some poor soul trying to read your code that you were loading a FLOATING, not DOUBLE precision number. Note that while this is not required, it's good practice.

We'll talk about some of the basic instructions here, and give some examples of their use.

### LDF/LDD

Meaning: Load floating/double

Syntax: LDF NUM,FO ;LOAD 'NUM' INTO FLOATING ACCUMULATOR 0

Simply loads the operand into the specified accumulator. This is the simplest way to get data INTO the FPP.

**NOTE:** In order to use symbols such as FO to represent floating point accumulators, you must define these symbols as follows at the beginning of the program:

FO = %0

F1 = %1

Incidentally, some folks prefer the symbol ACO (for accumulator); this would be defined as:

ACO = %0

AC1 = %1

and so on.

If the instruction

SETF (set floating)

were executed previous to the LDF instruction, two words of data would be loaded into accumulator 0; if the FPP were placed in double precision mode using the instruction

SETD (set double)

the LDF instruction (which should then be written as LDD) would load four words into the accumulator. (An example program follows the next instruction.)

### STF/STD

Meaning: Store floating/double

Syntax: STF FO,OUT ;STORE CONTENTS OF FO

Store the single or double precision number in the specified floating point accumulator.

The following code demonstrates the use of the instructions LDF and STF.

```
IN: .WORD 1,2,3,4 ;SIMPLE TEST NUMBERS
OUT: .WORD 0,0,0,0

FO =%0 ;DEFINE FLOATING ACCUMULATOR ZERO

F: SETF ;PUT THE FPP IN SINGLE PRECISION MODE
LDF IN,FO ;LOAD THE INPUT NUMBER INTO ACCUM. ZERO
STF FO,OUT ;STORE IT OUT AGAIN SO WE CAN SEE IF IT WORKS
BPT ;STOP SO WE CAN HAVE A LOOK

.END F
```

**VT-100, VAX, PDP-11 USERS:**  
**THE KEY TO FAST AND EASY EDITING**  
**OF YOUR KED OR EDT EDITOR**

INTRODUCING VT-100 KEYS FOR THE KED OR EDT EDITOR... These quality 3-color keys will make editing faster and simpler. They're easy to install—no overlays or engravings—just pull out the old keys and push in a new set with the editor's functions clearly stated. A set of 18 3-color keys — \$45.

**ORDER NOW** **Syntronics**  
 2420 University Ave. San Diego, CA 92104 (619) 692-0695

CIRCLE D137 ON READER CARD

A slight knowledge of ODT is assumed here in order to actually verify the results of this program; if the reader is not familiar with ODT, read on, I'm sure you'll understand the example. (If you wish to know more about ODT, consult the RSX/IAS ODT Reference Manual.)

First, you must assemble the program above (we'll call it FPP.MAC, and I'll try to keep the example operating system independent).

From CCL or MCR:

MAC FPP = FPP

or

MAC FPP,FPP = FPP

if you'd like an assembly listing.

To task-build:

TKB FPP/DA,FPP = FPP

to get an executable image (FPP.TSK) and a task-builder map (FPP.MAP).

The /DA tells TKB to include the 'Debugging Aid', ODT.OBJ, from the system library.

Now run the program:

RUN FPP

ODT:FPP

# Xerox interactive software for Digital hardware.

## Also for the new VAX-11/730.

Looking for software for your VAX? Xerox has good news for you. Praxa Software—proven applications software for manufacturers and distributors, specifically designed to run on Digital's *full* line of VAX computers.

Praxa has a wide range of integrated applications. Inventory Control, Purchase Order, Order Entry and Invoicing, Sales Analysis, Material Requirements Planning, Capacity Planning and Scheduling, Factory Order Control and Cost, Engineering Data Control, General Ledger, Accounts Receivable, Accounts Payable, and Payroll.

And the applications can be used independently or together to form a complete system.

Praxa is flexible, easily expandable, and simple to use.

The interactive systems immediately update all files affected by each transaction. And data input at terminals can be promptly edited for total accuracy. It's perfect for distributed data processing at multi-location companies. And the software is menu-driven so specialized training isn't required.

Applications are written in ANSI Cobol and run in native mode on VAX models.

But software is only as good as the people who stand behind it. And at Xerox, we have

over twelve years experience installing and supporting interactive systems. Our branch offices are in major cities nationwide. And in Europe, too. So we're there when you need us.

For more information about Praxa Software, call toll-free (800) 323-2818. In Illinois, call (800) 942-1166. Or send in this coupon.

And see how much Digital hardware can do with Xerox software.

---

## XEROX

CIRCLE D184 ON READER CARD

The '\_' is ODT's prompt; to look at the output data area, find the Global symbol OUT in the task-builder map. (on my system (RSTS/E V7.0) this was 2010, and remember, all numbers are OCTAL unless otherwise specified)

The following command will list the output data area on the terminal:

```
__2010;2016L
```

This tells ODT to list the memory area between 2010 and 2016 inclusive on the current terminal. The area should be zeros and look something like this:

```
002010/ 000000 000000 000000 000000
```

Now we can execute the program:

```
__G
```

This is the ODT command 'GO', which tells ODT to allow the user program to execute from the beginning.

When the BPT (Breakpoint Trap) instruction is executed, ODT will take control and prompt the user:

```
BE:002032
```

Again, these numbers may vary between operating systems and versions.

To look at the results, just type the 'L' (list) command again (if no arguments are specified with 'LIST', the range of memory locations last shown will be listed again):

```
__L
```

```
002010/ 000001 000002 000000 000000
```

Thus demonstrating the (single precision) LOAD & STORE operation of the floating point processor.

In comparison, the four word (double precision) operation can be shown by making a simple modification to the same program. Simply change the first instruction from

```
SETF ;set floating point mode
```

to

```
SETD ;set double precision mode
```

and re-assemble & task-build the program as described above.

This time the results after execution should be:

```
__L
```

```
002010/ 000001 000002 000003 000004
```

## MORE INSTRUCTIONS

A few other FPP instructions and their format follow:

### ADDF/ADDD

Meaning: Add floating/double

Syntax: ADDF NUM,FO

Adds the value stored in NUM to the contents of FPP accumulator FO.

The following sample program demonstrates the ADDF instruction. (The assembler directive '.FLT2' defines a two word floating number; the directive '.FLT4' (not shown here) defines a four word floater.)

This program can be used to experiment with the MULF, DIVF, AND SUBF instructions described below, by making the necessary changes.

```
NUM1:: .FLT2 1
```

```
NUM2:: .FLT2 2
```

```
OUT:: .FLT2 0
```

```
FO =%0 ;DEFINE FLOATING POINT ACCUMULATOR 0
```

```
F:: SETF ;SET FLOATING (SINGLE PRECISION) MODE
LDF NUM1,FO ;GET THE FIRST NUMBER IN ACCUMULATOR 0
ADDF NUM2,FO ;ADD IN THE SECOND NUMBER
STF FO,OUT ;STORE OUT THE RESULT
BPT ;STOP SO WE CAN LOOK AROUND

.END F
```

### SUBF/SUBD

Meaning: Subtract floating/double

Syntax: SUBF NUM,FO

Subtracts NUM from FPP accumulator FO, leaving the result in FO.

### MULF/MULD

Meaning: Multiply floating/double

Syntax: MULF #10.,F3

Multiply the contents of accumulator F3 by 10 decimal. Result is stored in F3.

### DIVF/DIVD

Meaning: Divide floating/double

Syntax: DIVF #8.,F1

Divide the contents of accumulator F1 by 8. Result is stored in F1.

### MOFD/MODD

Meaning: Multiply and integerize floating/double

Syntax: MODF #1,FO

This instruction can be used to separate the integer from the fractional part of a floating point number; which proves to be a very handy way to output floating point numbers.

When the instruction

```
MODF #1,FO
```

is executed, the floating point number in FO is multiplied by one (and therefore unchanged), after which the integer part of the number is stored in F1, and the fraction in FO.

Multiplication by 10. can be used to 'strip off' digits after the decimal point (also handy for printing).

### LDCDF/LDCFD

Meaning: Load and convert from double to floating or floating to double

Syntax: LDCDF NUM,FO

This instruction works two ways, depending on the mode the FPP is operating in.

In floating (single precision) mode, the source operand is assumed to be double precision and is converted to single precision. The number will be either rounded or truncated (if necessary) depending on the state of the FT (floating truncation) bit in the FPP status register. The various bits in the FPP status register (FPS) can be set or cleared with the LDFPS instruction.

In double precision mode, the source operand is assumed to be a single precision number, and is simply loaded left-justified in the accumulator. The low half of the accumulator is cleared.

### STCFD/STCDF

Meaning: Store and convert from floating to double or double to floating

Syntax: STCDF FO,NUM

In single precision mode, the specified accumulator is stored left justified in 'NUM' and the lower half of NUM is cleared.

In double precision mode, the AC is converted to single precision, truncated or rounded depending on the FT bit (described above) and stored in NUM.

### LDCIF/LDCID/LDCLF/LDCLD

Meaning: Load and convert from: integer to floating, integer to double, long integer to floating, or long integer to double

Syntax: LDCIF NUM,FO

These instructions are used to convert from either of the integer modes (integer or long integer) to either of the floating point modes (floating or double), depending on the current FPP state. Again, the state of the FPP is controlled with the instructions:

SETF ;set floating (single precision) mode

SETD ;set double precision mode

on the floating end, and the integer side with:

SETI ;set integer mode

SETL ;set long integer mode

The source operand (NUM) is converted and loaded into accumulator FO.

### STCFI/STCFL/STCDI/STCDL

Meaning: Store and convert from: floating to integer, floating to long integer, double to integer, double to long integer

Syntax: STCFI FO,NUM

These instructions complement the 4 load instructions above. Data is converted from either of the floating modes to either of the integer modes, depending on the current state of the FPP.

### LDEXP

Meaning: Load exponent

Syntax: LDEXP NUM,FO

Load the exponent of the specified accumulator with the data contained in 'NUM'. NUM is converted to excess 128. notation (see the description of INTERNAL FORMAT above for details on excess 128. notation).

### STEXP

Meaning: Store exponent

Syntax: STEXP FO,NUM

Stores the exponent of the specified accumulator in NUM and converts it from excess 128. notation to 2's complement.

### CLRF/CLRD

Meaning: clear floating/double

Syntax: CLRF NUM

Clears the specified location or accumulator.

### TSTF/TSTD

Meaning: Test floating/double

Syntax: TSTF NUM

Sets FPP condition codes depending upon the contents of location 'NUM'.

Note that before the standard BRANCH instructions can be used, the floating point condition codes must be copied to the CPU'S condition codes using the instruction:

CFCC

Have fun in FPP land — bye for now.

# EasyEntry<sup>TM</sup>

Quick forms design & data entry for  
RSX, IAS, RSTS, & VAX systems

- Immediate on-screen development of fill in the blank forms. No coding, compiling, testing—non-DP users can design forms
- Full of features—error checking, math functions, forms chaining, program calling, HELP, error messages, rekey verification, keypunch simulation, file maintenance, operator statistics...
- Creates standard files for use with other software.
- Low overhead. Supports high volume data entry.
- Low cost.
- Runs under many DEC operating systems. Uses DEC and non-DEC terminals.
- Easy to learn. Good documentation. Technical support is just a call away.

# PORTACALC

## A NEW (FREE) DEC SPREADSHEET

### Part 1

By Glenn C. Everhart

A spreadsheet program, written in FORTRAN, has been submitted to the DECUS library by the author recently in order to provide DEC users generally with access to spreadsheet functions without having to pay thousands of dollars for them. This program, called PortaCalc, was developed under RSX but runs in native mode under VMS as well. There are sites presently working on porting it to RT11 and to DEC20 systems also, but their status is unknown.

PortaCalc is similar to many other spreadsheets in that it displays a matrix of cells on a screen (up to 132 columns wide) which map onto a larger number of cells kept in the computer. At each location, there is a number and a formula, either of which may be displayed. Display formats can be chosen from the entire FORTRAN repertoire and individual columns may be set to different widths. Each cell may have a different format for its output, and the default format may also be changed. Unlike some sheets, PortaCalc allows multiple equations in each formula. (You can even comment the equations.) Any cell can refer to a command file which can be used to add user defined functions, using any cells and having 27 accumulators available which can handle integer data, floating point data, or multiple precision data of up to 99 digits width. (You can use a built-in interactive calculator at any point while working on a sheet also, and return to the screen display after, if you need to make further computations outside of sheet context). Maximum sheet size is determined by parameters set at compile time so that it depends solely on memory available. On PDP11 a 40 by 32 sheet is generally used at our site (nobody has needed a larger one yet). On VAX, the size is essentially unlimited. The spreadsheet is of course somewhat slower than some commercial ones due to the HOL and the way it computes formulas. However it is usable, and recalculation can be done manually to remove that overhead where it is not needed. The entire sheet can be driven from command files, which are able to prompt the user for terminal inputs, perform conditional tests and looping, and control inputs. There is even interaction with the sheet so that a computation in any cell can be used to control the looping in a command file. There is a data extraction command in the embedded calculator which can query sequential files to dynamically extract numbers or formulas from predefined files which can be created and maintained with normal editors. Thus, PortaCalc is designed to be used with command files as well as from terminals. A knowledgeable user can program PortaCalc for a variety of applications.

PortaCalc is unique in that every cell on the screen can (if desired) become a separate window onto the physical sheet. It is up to the user to determine what should be map-

ped. A pair of "origin reset" commands act as a fast scrolling operation for contiguous parts of sheets. The mappings set up onto the screen can be used in computation, so that they define a projection onto the physical sheet which can be summed over, averaged, etc.

The PortaCalc sheet as supplied to DECUS presently supports VT100 terminals (with or without AVO), or VT52 terminals. Also there are versions of the UVT100 subroutine (which is the only screen access routine) for Datamedia Elite 1500 terminals and for Datamedia Colorscan 10 terminals. The program is designed to be easy to recustomize for terminals with more than 24 lines also. Versions for RSX11M, RSX11M+, and VMS are easy to generate with supplied command files, and all documentation is machine readable. Also supplied, in the hope it will be helpful, is a document describing known features of the FORTRAN used (FORTRAN IV PLUS) not part of the ANSI 66 standard. It is not complete, but will give a good start to people modifying the package for their own machines.

Due to space limitations, PortaCalc does not have built in graphics. Rather, there is a separate program which reads saved sheets and can produce histograms or scatter plots of any parts of a sheet by name. Since one can save or restore whole or partial sheets, or restore partial sheets to different locations, these save files will normally be made anyway to simplify merging different sheets. The graphics utility can access these files. It, too, is available in source. The current intention is that data base access and word processing may be integrated by this route. The screen can be saved as a normal ASCII file, of course, at any time and that can be easily included in documents.

The following are two pictures generated by PortaCalc of its screen and including the row/column labels. These may be suppressed if they are not wanted. The VT52 type cursor is added in by hand; the VT100 reverse video effect cannot be reproduced this way.

Note that on the VT52, the ">" character indicates the cursor. On a VT100, reverse video is used instead, and the entire cell is shown in reverse mode. The formula of the current cell is always exhibited at the bottom of the screen if any exists.

The documentation supplied is sufficient to use the sheet. However, a calculator from DECUS was used as the computing engine (which made writing the rest a two week job). Its documentation is also included, but not integrated with the documents for the spreadsheet. You'll need to examine both to discover which functions exist and can be used. Full "scientific calculator" functions exist, plus some statistical ones. Financial ones, however, are not (the neces-

**FIGURE 2. VT52 Screen. Formula Display**

sary trick to add them by indirect files is mentioned in the documents though). Also, PortaCalc does not have a lookup function as such. Rather, it gives you a way to treat the entire sheet as a large array and access any of it computably. This is a similar but more general function, since it gives the ability to make two dimensional tables rather than just single dimensional ones.

The PortaCalc program is already in use by DECUS staff internally, and will be available shortly from the library, though its order number has not (as of 2/15/83) yet been assigned. Expected cost for order will be about \$140 for the special collection tape containing all code, and possibly around \$60 for the single program version which will leave off some extra goodies added to the original submission not related to PortaCalc. Earlier versions will appear on DECUS RSX (and maybe VAX) SIG tapes for Fall '82, but users wanting the full version must order it from DECUS. There are of course NO license restrictions. If you have RSX and desire file security, you may obtain the special collection and use the secure virtual disk package included therein to handle the security needs separately from this package; that driver is included in the special collection tape version of DECUS PortaCalc.

**ABSTRACT:**

The PortaCalc spreadsheet is a FORTRAN written program able to perform the usual "what if" types of calculations for anyone with a compiler, 31KW of task space (more or less), and (in the present version) an ANSI 3.64 terminal

(e.g. VT100). The program is easily recustomized for other terminals and designed for portability and functionality. A data management system interface is built in, permitting spreadsheets to access a potentially unlimited number of files and records or parts of records in those files for user defined functions, numbers, formulas, text, or whatnot. In fact it has many of the attributes of a language.

Three versions are provided, with complete source code for all: a PDP11 version for I/D space machines that builds flat under RSX11M+, an overlaid version for other mapped PDP11's under regular RSX (11M or 11D/IAS), and a version for VAX that builds (flat of course) under VMS. I assume the F77 compiler but the program is in FORTRAN 66 (I use the /NOF77 switch). It is expected only minor changes would be needed for the DEC FORTRAN IV compiler however.

A separate graphics output task is documented in PCG.DOC and provides histograms or scatterplots of any areas of the saved spread sheets with a simple command syntax.

**RESTRICTION:**

The overlaid version provides only a rather small spreadsheet, though it is large enough to be useful in many applications. There are some overlay tricks I haven't tried to increase the size.

**SPECIAL HARDWARE:**

The software must be built for the appropriate terminal. Versions of the UVT100 subroutine for VT100, VT52, and Datamedia Elite terminals are supplied, with command files for most combinations. The VT52 version will show what the minimum requirements are for control. Most any terminal can be easily interfaced to the package by editing one of the UVT100 routines to correspond to the terminal's control sequences, provided direct cursor addressing is supported.

**BUILD:**

There are 4 build files.

- COMPIL.COM Build for VAX/VMS . . . only compiles. Concatenate the objects and link.
- MAKE.COM Non-overlay I/D space build for RSX11M+ V2 (uses F77 Compiler in non-F77 mode)
- OMAKE.COM Overlay build. Medium sized overlay, small sheet. For 11M systems, any 11.
- SOMAKE.COM More compact overlay structure, bigger sheet. OK for any 11, RSX11M/M+.

Note: THERE ARE COMPILER WARNINGS (ABOUT FUNCTION "INDEX") WHICH SHOULD BE IGNORED DURING THE BUILDS.  
I ASSUME FORTRAN 77 IS INSTALLED AS . . . F4P.

**PRIOR TO BUILD:**

You must be sure the final VKLUGPRM.FTN is as you will need it. The PDP11 command files generally copy one of the template versions to this file, but the parameter file may be edited as may any template. The VAX versions of com-

mand files generally assume you know what you have is right. READ the appropriate template.

Supplied templates include:

VVKLUGPRM.FTN	VAX "standard" version for VT100 with or without AVO
BVKLUGPRM.FTN	VAX "big" version for VT100
VVKLUGPR5.FTN	VAX "standard" version for VT52 systems
BVKLUGPRM.FTN	VAX "big" version for VT52 terminal use
MVKLUGPRM.FTN	PDP11 version for RSX11M+ V2 I/D space, VT100
MVKLUGPR5.FTN	PDP11 version for RSX11M+ V2 I/D space, VT52
SVKLUGPRM.FTN	PDP11 version for RSX11M/M+ overlain, VT100
SVKLUGPR5.FTN	PDP11 version for RSX11M/M+ overlain, VT52

Note that several variants of UVT100 exist too. The ones presently included are:

UVT100.FTN (.FOR for VAX)	VT100 control, no Advanced Video Option (AVO) assumed. Many entries are not called by PortaCalc. The ones that are used are: CUP Cursor Position ED Erase Display SGR Set Graphics Rendition EL Erase Line ANSI set ANSI mode (may be nooped)
UVTAVO.FTN	VT100 control with AVO terminal support. Includes only entries needed. Also uses underline to underline alternate rows and will display display-sheet row numbers as well as physical ones.
UVT52.FTN	VT52 control. Since VT52 terminals have no reverse video, draws a ">" character in first col. of cell pointed at to indicate cursor location.
UVTDM.FTN	Datamedia Elite 1500 control. Similar to UVT52 but cursor controls for Datamedia.
UVTCS.FTN	Datamedia Colorscan-10 control. This terminal uses VT100 sequences, but UVTCS will use some of the color setup sequences to create a multicolor spread sheet.

You may easily adapt the UVT100 subroutine from any of these to handle whatever terminal you have using these routines as examples. Note the parameter JVTINC in the VKLUGPRM.FTN which adjusts for the backspace generated by UVT100 on SGR calls needs to be set correctly.

Adapting UVT100 to your terminal and setting up VKLUGPRM.FTN correctly are the necessary setup actions needed prior to compiling and building PortaCalc. You may of course get UVT100 to determine what terminal type is there itself, or use the VMS terminal independent cursor positioning logic, if you wish. On a VAX you may also want to inhibit scrolling. To get PortaCalc to control the PDP11 more efficiently you may also want to SET /SERIAL=TI: under RSX (which will inhibit MCR from grabbing input you

want to send to PortaCalc). Remember under VMS to copy the desired file to VKLUGPRM.FTN before compiling.

Ignore compiler/linker errors in RSX or VMS. They are harmless warnings.

#### WRITEUP:

This is a spreadsheet written in FORTRAN (the only universal assembler) for portability. Its functions are described in the separate document file; it assumes VT100, but the UVT100 routines are the only places the VT100 is actually handled in screen mode, and may be altered for other machines.

The spreadsheet sizes may be defined by editing the parameter file Vklugprm.ftn (caveats and restrictions are listed there). There are 2 sheets — a big physical sheet and a small display sheet which is what's really shown on screen. Sheets may be saved/merged/restored/ linked (via saved files)/printed or hardcopy made onto files. Numerous other functions exist. The thing is built with I/D space here but ought to be able to be overlaid. Specifically, CALC and its routines can be diskbased overlays, and DSPSHT should be able to be another leaf. However this is not tested. You can tailor the size by editing physical sheet size.

WHEN BUILDING PORTACALC, YOU MAY ENCOUNTER FORTRAN WARNINGS ABOUT THE INDEX FUNCTION BEING ASSUMED USER SUPPLIED. IGNORE THESE; THERE IS AN INDEX FUNCTION SUPPLIED HERE, AND THE WARNINGS ARE OF NO CONSEQUENCE, EITHER ON PDP11 OR VAX.

The program has been tried overlaid. However, if you use the module OXQTCMD instead of XQTCMD and OSPREDSHT instead of SPREDSHT, an overlay structure could be used roughly like this:

Root: Spredsht,Index, all commons, UVT100, VARSCN

Leaf 1: XQTCMD

Leaf 2: RECALC, CALC, and all subroutines of CALC

Leaf 3: DSPSHT

The subroutines of Calc may be possible to overlay so that Leaf 2 (which will likely be the largest) can be shrunk. You will want to edit VKLUGPRM.FTN to make a sheet the size you like. If it gets bigger than rather smaller, you will possibly have to use virtual arrays or some other trick. By the next DECUS symposium there may be a better version or one that will work on smaller systems completely defined, but you may be able to fit this on a small system by overlays. On a VAX of course it all builds flat with as large a sheet as you like.

#### REVISION:

There are 2 ODL files, either of which can build a reduced version when the fortran files are compiled with OVKLUGPRM.FTN renamed to VKLUGPRM.FTN, included. There is a bit of extra space so the parameters in that file can be enlarged somewhat. They use a very overlain FCS and F4P OTS. You may be able to do similar things clustering an FCSRES and a F4PRES together too. However, the overlay versions (made with the OMAKE.CMD file) do work, though more slowly than the I/D space one. This at least gets you something on a machine with only normal 11/34 type resources. I assume the F4P or F77 compiler here for the OTS part. You will need to tailor to other Fortran compilers on PDP11's yourself.

## ERGO<sup>®</sup> 301

GUARANTEED  
VT100\*  
COMPATIBLE  
FOR ONLY

# \$895

Micro-Term has been manufacturing VT100\* emulators almost as long as DEC has been manufacturing VT100's. We guarantee that our ERGO 301 will correctly operate your DEC software—ALL of it. If we're wrong, we'll take the unit back and you don't have to pay for it.

In addition to complete DEC compatibility, check these extra features. At \$895 list, it's worth a try.

- Advanced video standard
- Bidirectional printer port
- 2 pages of memory
- Plain English set-ups
- User programmable function keys
- Green Screen with Screen Saver
- Superior 132 column clarity
- Optional Plot 10 and ReGIS Graphics
- Full one year warranty

On site service available at over 450 locations through Western Union.

# FROM THE RT-11 EDITOR

## HOW TO USE RT-11 WITH DISKS WITH BAD BLOCKS

By Arthur Edward Groulx, Logicaid Limited, Nepean, Ontario, Canada

All disks or diskettes used in LS1-11 or PDP-11 computers store information in logically discrete units called "blocks." A block consists of a contiguous sequence of 512 characters (or 256 words). The logically discrete units are usually physically discrete on the surface of the recording medium as well, although in some cases (RX01/2 and RLO1/2, for example), the logical blocks may be subdivided into smaller physical sectors. In this article, though, we'll talk about blocks as if they were physically contiguous areas of 256 words.

This might surprise some readers, but not all disk packs, disk cartridges and diskettes (hereinafter referred to simply as "disks") used by RT-11 are perfect in the sense that they store all information completely. Most magnetic media, whether purchased from Digital or not, contain slight imperfections on their surfaces which can inhibit the proper storage of data thereon. Usually these imperfect areas appear at random positions on the disk. These imperfect areas are generally referred to as "bad blocks."

A bad block can exist on a disk the day it is born, or can develop over a period of time. Sometimes disks are manufactured which have no bad blocks at time of birth. When you order disks from DEC, you can specify these special disks by ordering part numbers ending in EF (error-free) instead of DC (data cartridge). For example, an RLO2EF disk is guaranteed to have no bad blocks when you receive it. An RLO2DC disk carries no such guarantee, although it might accidentally have no bad blocks on it. The guarantee increases the cost of the disk, and it does not provide any warranty that the disk will not develop bad blocks at some time in the future. A new bad block can be created simply through age, or, more commonly, by powering down a disk drive while a data transfer is in progress.

When the manufacturer discovers during testing that an RLO1/2 or RK06/7 disk was born with bad blocks, that information is stated in machine-readable form on the disk itself. This information is called "Factory Written Bad Sector Information." The information includes the disk serial number and a table of what bad sectors were identified during factory testing. This information is important as far as RT-11 is concerned. We shall refer to the FWBSI (faw-busy) often in this article. The FWBSI normally appears in the last few blocks of the disk.

### How to Determine if Your Data Cartridge Has Bad Blocks

The DUP utility of the RT-11 operating system determines whether any disk contains bad blocks. It is invoked by the RT-11 keyboard monitor DIR command. The format of the command is:

`.DIR/BAD XXn:`

where XX is the device mnemonic (for example, DL for RLO2's) and n is the drive number.

During the execution of this command, DUP attempts to read and write each block on the specified disk. After completing, DUP displays a message stating what bad blocks, if any, were found, and where the bad blocks were located on the disk. If the message is not received, if the message received doesn't make sense (for example, a humungous number of bad blocks), or if RT-11 loops or crashes, recovery procedures as outlined below must be followed.

There are three types of bad blocks detected by DUP. These are "Hard," "Replaced," and "Replaceable." Hard bad blocks are those which are either permanent, or might only be recovered by reformatting the disk (more on formatting later).

Replaced bad blocks can exist on only RLO1/2 or RK06/7 disks. These types of media contain a table in block 1 (the so called "home" block) which was created at some previous time. The table contains information required for mapping bad blocks of the disk onto good "replacing" blocks. The replacing blocks in the disk normally reside at the end of the disk in front of the FWBSI and are usually not accessible by RT-11 programs. Each entry in the bad block replacement table in the home block contains two words. The first word is the number of the bad block; the second word is the number of the replacing block. The table ends with a zero. RT-11 does not permit block zero to be a bad block. For RLO1's and RLO2's the table may have a maximum of 10 entries. The table for RK06's and RK07's may have a maximum of 32 entries. How the replacement table is created will be covered in greater detail later.

Replaceable bad blocks are blocks which DUP deems to be bad but which do not yet have an entry in the bad block replacement table.

Replaced and replaceable bad blocks only occur with RLO1/2's and RK06/7's. Hard bad blocks occur with any

# You can get more from your VAX computer or RSTS system with MAS-M.

MAS-M is the application software system from Martin Marietta Data Systems that can help you do more with your DEC hardware. That's because MAS-M is the on-line software system that gives you much more than you'd expect from packaged software.

## More Flexibility.

MAS-M's modular design lets you choose from 10 different application systems:

- Accounts Receivable
- Accounts Payable
- General Ledger
- Order Processing
- Invoicing
- Inventory Control
- Inventory Accounting
- Bill of Materials
- Material Requirements Planning
- Purchasing

You can implement just the modules you need to satisfy your demands. And no matter which combination you choose, the MAS-M system is always fully integrated.

MAS-M's flexible design also makes it easy to install, and simple for your users to operate. The MAS-M/VAX package is

written in native mode VAX-11 BASIC and the MAS-M/PDP package is written in BASIC-PLUS-2 under RSTS/E. Both of these packages are based on the RMS data management system. These features make both MAS-M packages fully compatible with your current RSTS/E or VAX/VMS operating system.

## More Control.

You can count on MAS-M for more comprehensive data accuracy and security, too.

MAS-M's powerful transaction processing MONITOR gives you maximum control over your data—from start to finish. User passwords and menu selections are checked against user security profiles. Data entry validation is also standardized in the MAS-M MONITOR, so any invalid data can be corrected *before* it reaches your application program.

## More Productivity.

MONITOR is also an important tool in developing new applications. You can use MONITOR to create input screens and validation rules on-

line. And, MONITOR can help you improve programmer productivity by providing a standard framework for input of code that minimizes the difficulties of user interface and terminal characteristics.

## More Support.

You can count on Martin Marietta Data Systems for system development and implementation, comprehensive training, and clear, concise documentation. We can also provide an extensive Maintenance Service to support your MAS-M system.

What it all adds up to is a packaged software system that can give you everything you need to get your jobs done. And more. Write or phone us today, and we'll tell you more about how the MAS-M software system can work for you.

# DMA Line Printer Controller Gives VAX Users a High Performance Alternative to the DMF/32.

## The ABLE VMZ/LP™ Beats Everything in its Class

### Features:

- Larger size character buffer (256 characters)
- DMA transfers
- Expanded formatting capabilities
- On-board diagnostics, LED display
- System software capability
- Ease of installation
- User friendly

VMZ/LP™, one of the most advanced line printer controllers on the market, is available now. Find out more about it and the rest of our full line of DEC-compatible modules. Write for details.

device that does not support bad block replacement. Such devices are thus any devices other than RL01/2's and RK06/7's. Hard bad blocks may also occur with RK06/7's and the reasons why appear below in the section on how the bad block replacement table is created.

### How Bad Block Replacement Works

Another overlay in DUP is used to create the bad block replacement table, via the RT-11 keyboard monitor INIT command. DUP attempts to read and write each block of the disk. If the operation is successful, the block is good. If it isn't the block is bad. If there is room in the bad block replacement table, an entry is ALWAYS created if the device is an RL01/2, and MAY be created if the device is an RK06/7. For the latter device type, the entry is only created if the block was bad because of a bad sector error (BSE) or header vertical redundancy check error (HVRC). Any other error type results in RT-11 deeming the RK06/7 bad block to have a "hard" error. The FWBSI information is merged with the scan information to complete the replacement table. In RT-11 version 4 or later, if there are more bad blocks on the disk than the maximum allowable entries in the bad block replacement table, the user is permitted to specify the subset of the bad blocks which are to be replaced, by responding to prompts after a replacement table overflow warning message. The remaining bad blocks are treated as if the device did not support bad block replacement (see "Getting Rid of Bad Blocks" below). In no case will RT-11 permit initialization of a device containing bad blocks in the "system area". The system area consists of blocks zero through six inclusive, and on bad block replacing devices, the use of a device having more than 128 bad blocks. The actual reason for this last restriction is unknown.

After an RT-11 boot, the first access to each RL01/2 drive causes the bad block table on the disk to be read into memory. Each bad block table is at most 20. words long (a two word entry for each bad block). For systems with the maximum four drives, this means 80 words are allocated in the DL handler for storage of the bad block replacement tables. When the DL handler does a data transfer, it breaks up the transfer into pieces which straddle any bad blocks. For example, suppose a data transfer requests the reading of 40 (octal) blocks starting at block 7000 of drive 2. The DL handler

first checks to see if the bad block table for that drive is in memory. If it isn't, it reads it first. Next, after insuring the replacement table is available, let's say it determined that block 7003 was replaced by block 23743, the handler reads three blocks starting at 7000 and ending at 7002, reads block 23743, then reads blocks 7004 through 7037 inclusive. If there were other bad blocks in the interval being read, the intervals would be further subdivided to skip the bad blocks.

The situation is somewhat different with RK06/7 drives. Because the maximum number of entries in the bad block table is 32., this means 32. (thirty-two entries) times 2 (two words per entry) times 8 (eight drives per system) or 512. words of memory would have to be reserved in the DM handler to accommodate all bad block replacement tables simultaneously. When memory in the lower 28Kw is at such a premium, it is simply unrealistic to devote that much memory to a function which might not even be used.

This problem is circumvented using the following technique. If a data transfer on an RK06/7 results in a BSE or HVRC error, the handler THEN checks to see if the bad block replacement table for the offensive device is in memory. If it isn't, the table is then read, possibly destroying any other bad block replacement table which might have been there previously. The bad block is looked up, and the transfer then proceeds as per the RL01/2 case. Consequently, only 80 words of memory need to be reserved for the RK06/7 replacement table. You can now see why bad blocks on an RK06/7 which DO NOT result in a BSE or HVRC error must be called "hard." Such bad blocks cannot trigger the replacement mechanism, and consequently cannot be replaced.

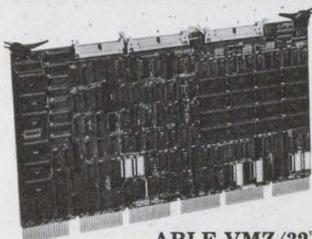

There is a penalty paid for bad block replacement. First, a single data transfer is broken up into two or more data transfers. Second, some extra latency occurs when the bad block table itself must be read into memory. This is particularly apparent in multi-drive RK06/7 configurations if many of the drives contain disks with bad blocks. The handler would be constantly reading the bad block replacement tables over one another. This significantly affects performance in transaction-oriented systems, as the heads in such drives must always return to the outermost cylinder of the disk in order to reread the replacement tables.

One also has to be very careful of switching disks in an

# If you're in the market for communications modules, make the ABLE connection now. And join the thousands who already have.

We are known as the innovators. Most of our products are industry "firsts" which become popular quickly, then settle into a stage of steady long-term acceptance. These four DEC-compatible, communications devices fit the pattern perfectly. They are ABLE originals. They achieved instant success worldwide. They provide top performance. And they are very reliable. Read on to find the one for you.

## INCREASED VAX THROUGHPUT.

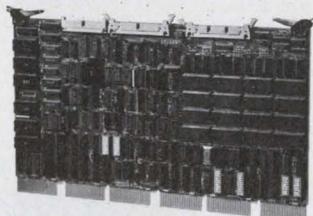

ABLE VMZ/32<sup>™</sup>  
16-line DMF/32 subset

Here's an asynchronous microcontroller with programmable DMA, fully transparent to VAX/VMS as two 8-line DMF 32's and contained on a single board. Priced

below the DZ11-E, it outperforms DZ or DH devices under VMS v.3, has interrupt-driven modem control on every line, and includes an output throttle which lets peripheral devices optimize their own data rate.

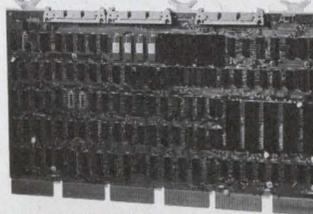

## #1 UNIBUS DMA.

Then there's our DH/DM, the original multiplexer which puts 16 lines with modem control on a single board. This popular device meets UNIX VAX system needs for DMA communications requirements, serves UNIBUS systems equally well, and beats them all for MTBF, throughput and

ABLE DH/DM<sup>™</sup>  
16-line combination DH11  
& DM11 replacement

price. Other features include on-board diagnostics, modem control on all lines, superior on-board silo depth and variable prom-set. **SYNC/ASYNCH FLEXIBILITY.**

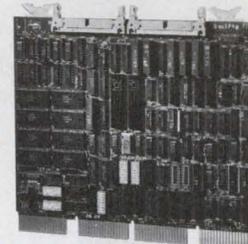

ABLE DV/16  
16-line DV11 replacement

A controller for the PDP-11 user, the DV/16 contributes microprocessor-derived flexibility, which permits mixing of sync and async lines in combinations

of 4 or 8 lines with modem control and full system software compatibility. It takes less than half the space of a DV11 and uses word transfer instead of byte DMA to gain a 2 to 1 speed advantage or permit operation in half the bandwidth required for data transfers.

## Q-BUS DMA.

The Q/DH is an asynchronous controller which makes DH-class performance possible on PDP-11/23 and LSI-11/23 Q-BUS systems. It connects the standard Q-BUS to as many as 16 async lines with DMA output capabilities and allows optimum Q-BUS utilization. Features include software compatibility with RSTS/E and RSX operating systems, large input silo, modem control on all lines.

ABLE Q/DH<sup>™</sup>  
8 or 16-line DH/DM  
for Q-BUS

CIRCLE D39 ON READER CARD

RL01/2 or RK06/7 drive while the RT-11 system is running, without rebooting the operating system. It is possible to lose data if the system is not rebooted after every disk change. This is because the DL and DM handlers treat the memory resident bad block replacement table as if it belonged to the current disk, instead of the disk from which the bad block replacement table was actually read. The subsequent act of bad block replacing can destroy data on the current disk, by writing data into replacing blocks which are actually mapped to another area of the disk.

All RT-11 utilities which require unloading and reloading of RL01/2 or RK06/7 disks force a reread of the replacement table from the new disk. User programs may also do so by using "special function" programmed requests documented under .SPFUN in the RT-11 Advanced Programmer's Guide.

One wonders, then, whether bad block replacement is actually worth it. Its existence is necessitated by the fact that all files in RT-11 are contiguous, that is, files in RT-11 are comprised of a sequence of adjacent blocks. If there is a bad block in a disk, the size of the largest file on the disk would be the size of the largest disk space on either side of the bad block. It is thus seen how bad blocks restrict file sizes. By making the files LOGICALLY contiguous, at least insofar as straddling bad blocks go, the largest file can still be as big as the size of the disk.

For your convenience, the following table contains information summarizing bad block replacement on RL01/2s and RK06/7s. All block numbers and counts are stated in octal.

	Number of replacing blocks	Block number of first replacing block	Block number of first FWBSI block	Number of FWBSI blocks
RL01	12	23742	23754	14
RL02	12	47742	47754	14
RK06	40	64664	64740	26
RK07	40	150734	151010	26

### Getting Rid of Bad Blocks

In order to minimize the number of bad blocks on an RT-11 disk, follow the upcoming procedure. We will assume that the disk to be initialized contains no valuable data, as we plan to write on every block on the disk. We will assume that you have an RT-11 version 4 or later single job operating system running, with the relevant device handler available on the system disk, and that the RT-11 utilities DUP.SAV and FORMAT.SAV are also present on the RT-11 system disk.

#### STEP 1: Disk Hygiene

First, don't promote the possibility of creation of bad areas on the disk surfaces by sloppy computer room practices. Make certain fingers are kept off disk surfaces. Do not permit smoking in or around the computer area. Don't power down a drive while a disk transfer is in progress — halt the processor first and then bring down the drive.

Next, get your disks cleaned regularly by a reputable disk cleaning firm. The name of such a firm can be found in your yellow pages under "Data Processing Equipment — Repairs and Maintenance." If you are experiencing intermittent disk input/output errors, the disk may be dirty. Cleaning the disk is the first step to removing bad blocks.

### STEP 2: Primary Initialization

This step should be performed on all disks which support bad block replacement. The reason for this step is that if the disk has been used in the past by RSX-11 (another operating system) or by DECX-11 (DEC diagnostics), the bad block replacement table can be corrupted which can cause any other RT-11 procedure to loop or crash. The primary initialization procedure writes a zero in the first word of the home block, indicating that no bad block replacement table is present. The correct RT-11 keyboard monitor command is:

```
.INIT/NOQUERY XXn:
```

(Hereinafter, the device name will be referred to as XX and the drive number as n.) If this operation fails, particularly with the message that there is a bad block in the system area, then either there is indeed a bad block in the system area, or the FWBSI has been accidentally corrupted. To recreate the FWBSI, follow the instructions in Step 5 below now. If there is a bad block in the system area, the disk is unuseable by RT-11 and must be discarded. If the disk is brand new, return it to the manufacturer, as even if the FWBSI is corrupted, it means it was corrupted by the manufacturer. It is the manufacturer's responsibility to give you a valid FWBSI.

### STEP 3: Formatting

There are two types of formatting. The first type of formatting is "block header" formatting. Block header formatting is used on the following device types: RX01, RX02, RK05, RK06, RK07, RP02, and RP03. When this type of formatting is performed, information used by the device controller is written into the header of every block.

The second type of formatting is "verification" formatting. It is used for every other type of device not formatted with block header formatting.

The correct RT-11 keyboard monitor command for block header formatting, except for RX02 diskettes being formatted in single density mode is:

```
.FORMAT/NOQUERY/VERIFY/PATTERN:1 XXn:
```

The correct RT-11 keyboard monitor command for block header formatting on RX02 diskettes being formatted in single density mode is:

```
.FORMAT/NOQUERY/VERIFY/PATTERN:1/SINGLEDENSITY DYN:
```

The correct RT-11 keyboard monitor command for verification formatting is:

```
.FORMAT/NOQUERY/VERIFY:ONLY/PATTERN:1 XXn:
```

The format command will report information found in the FWBSI (if there is one) as well as other bad blocks not found in that table. All formatting using a PATTERN value

CIRCLE D60 ON READER CARD

of 1, leaves the disk with a verification pattern of zeroes, meaning the disk contains all zeroes. This is exactly what is needed so that no further bad block replacement is attempted. Other values of the PATTERN parameter give different results. They should not be used for disk initialization.

#### STEP 4: Final Initialization

Final initialization creates the bad block replacement table (on disks that support that feature) and the initial RT-11 directory.

The correct RT-11 keyboard monitor command for devices that support bad block replacement is:

```
.INIT/REPLACE/NOQUERY XXn:
```

The correct RT-11 keyboard monitor command for devices that do not support bad block replacement is:

```
.INIT/BAD/NOQUERY XXn:
```

For the latter type of devices, and RK06/7's with hard bad blocks, RT-11 will allocate files over the bad block areas. These files have the name "FILE .BAD" (spaces intentional). These files are very difficult to access using most RT-11 keyboard monitor commands. Some RT-11 commands recognize this special name, particularly the SQUEEZE command which squeezes files "around" the .BAD files, as well as not moving the .BAD files during the squeezing.

If RT-11 reports that there is a bad block in the system area and the device is therefore unuseable, if the device is an RL01/2 or RK06/7, then it may still be possible to recover the disk using Step 5. Otherwise, the disk is actually unuseable and must be discarded.

#### STEP 5: Recreating FWBSI

The RT-11 directory system and constraints in the handler prevent normal RT-11 programs from both reading from and writing into the FWBSI. It is still possible to do so, accidentally, from user-written programs. Corrupting the FWBSI results in an inability to initialize the disk even if the disk actually has no bad blocks.

A MACRO-11 program has been provided at the end of this article which permits FWBSI creation in a rather superficial form. It assumes that there are (were) no factory-detectable bad blocks on the disk, and sets up the FWBSI as if that were the case. It therefore relies totally on the DUP program for correct detection of the bad blocks on the disk and their inclusion in the bad block replacement table.

The program also recreates the disk serial number. The serial number of the disk can be found on a small sticker on the bottom of the disk pack after the base has been removed and before insertion into the drive. The serial number consists of at most ten OCTAL digits. The serial number appears as the first part of the FWBSI. We don't know of any RT-11 programs which make use of the serial number, so if the sticker has been removed, don't worry. The utility will give the disk the serial number 7777777777.

For RK06/7's, the FWBSI also contains a flag indicating whether or not the disk is an alignment cartridge. The FWBSI program sets the flag as if the disk is NOT an alignment cartridge, so please don't use the program on your alignment cartridges. Alignment cartridges are normally red in colour.

After creating the program, called FWBSI.MAC, using your favorite editor, assemble it using the RT-11 keyboard monitor command

```
.MAC FWBSI
```

and create a program module using the RT-11 keyboard monitor command

```
.LINK FWBSI
```

In order to use the program, enter the RT-11 keyboard monitor command

```
.R FWBSI
```

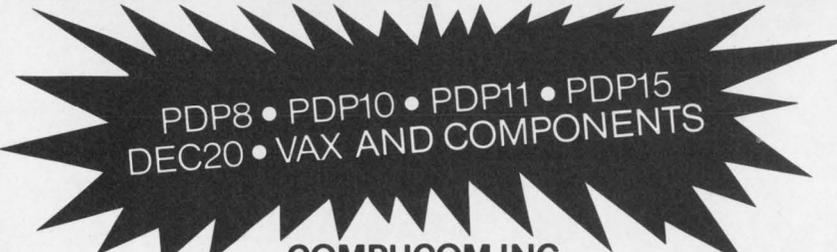

FWBSI is used like any other RT-11 utility. In response to the prompting asterisk, enter the name of the device and drive, followed by a /H and /L switch or switches with values

```
*XXn:/H:00567/L:43210
```

The value of the H switch is the five high-order octal digits of the serial number. The value of the L switch is the low-order octal digits of the serial number. If either switch is omitted, the program assigns 77777 as the five related digits. The above example would produce a serial number of 56743210.

Various error messages might be generated which should be self-explanatory. Insure that the device is not write-protected. FWBSI works only with RLO1/2 or RK06/7 disks. If you make a mistake and don't create the source file FWBSI.MAC correctly, it will tell you immediately when FWBSI is first run.

After running this step, start again at Step 1 in order to initialize your RLO1/2 or RK06/7 disk for use with RT-11.

### User-Written Disk Handlers

If you are planning to write a device handler for a new disk type, you might consider including bad block replacement. If you do so, under RT-11 version 4 you must also provide a utility to take the place of DUP in initialization of the disks.

Your utility must read and write every block of the disk to insure that it is not bad. The RT-11 .SPFUN (special function) programmed requests are used to do this without paying any attention to the bad block replacement table which might already be on the disk. If you are clever, you can time the reading and writing of each block so that some are skip-

ped during each of a precalculated number of passes, so that the next block you want to access is under the read/write heads just when you want to access it. Some experimentation will be necessary in order to determine the optimal number of blocks to skip during each pass. You might also consider attempting to read or write only large quantities of blocks, and accessing block by block only when a large access fails, indicating one or more bad blocks inside the last large access. Both techniques will considerably improve initialization elapsed times.

After determining the contents of the bad block replacement table, your program must write it into block one, then force the handler to reread it using another special function programmed request. Finally, your program creates the RT-11 directory structure on the disk.

Under RT-11 version 5, it is possible to patch the DUP program to make that program aware of the user-specified device which supports bad block replacement. The patch is described in Chapter 2 of the RT-11 Version 5 Installation Guide. This patch informs the DUP program of the device code of the new device, and also whether all bad blocks are replaced (RLO1/2 style) or only those bad blocks which return bad sector errors (RK06/7 style). This facility obviously saves the user a lot of work.

### Placement of the RT-11 Monitor Files

As a final note, you must be careful where the RT-11 monitor files (files with names of the form RT-11xx.SYS) are placed on any device supporting bad block replacement. These files must NOT be placed so that any of their blocks are replacing blocks. Because of size limitations, the boot program does not have enough intelligence to put bad block replacement into effect during the boot process. Consequently, booting will fail in the attempt to read the bad block in the monitor file.

To determine if the monitor files straddle any bad blocks, first use the RT-11 keyboard monitor command

`.DIR/BAD XXn:`

to determine the physical locations of the bad blocks. If there are any bad blocks, use the RT-11 keyboard monitor command

`.DIR/POS XXn:RT11*.SYS`

to find out if any of these bad blocks occur in the RT-11 monitor files. If they do, you must move the monitor files to another area of the disk using the RT-11 keyboard monitor copy command

`.COP/SYS XXn:RT11*.SYS SSn:*.XYZ`

where XYZ is a file extension not used elsewhere on the disk. Then use the RT-11 keyboard monitor RENAME command to use up the area containing the bad blocks:

`.RENAME/SYS XXn:RT11*.SYS XXn:*.NDG`

and use a similar command again to recover the monitor files

`.RENAME/SYS XXn(*.XYZ *.SYS)`

Of course, if the new monitor files straddle bad blocks, you must repeat the above process (using suitable file extensions). You must also insure that future uses of the RT-11 keyboard monitor SQUEEZE command do not move the monitor files into an area where they again straddle bad blocks.

... continued on page 137

## DON'T GET TSX-Plus!

### (Without a Sub-Device System from OMNEX)

Let the RT-11 Volume (device) size be determined by the user — not by the hardware device. The Omnex Sub-Device System provides multiple Virtual Devices to RT-11/TSX + Segregate files by project context, programmer, version, etc.

#### Sub-Device Files

- reside on host devices
- contain an RT-11 Volume image
- are accessed via the SD Handler
- can be nested

#### Sub-Device System

- Simple to Sysgen—simple to use
- many user-oriented features
- comprehensive documentation

#### SD Handler

- used to access Sub-Device Files
- 8 units/user — SD0: through SD7
- each TSX + user has own set of SD units

#### TSX + Support

- Omnex actively supports TSX +

# RSX-11M TO RSX-11M-PLUS MIGRATION

By Allen A. Watson  
Manager, System Technology  
Bergen Evening Record, Hackensack, NJ  
(Reprinted from Computers-R-Digital, Volume 4, Issue 12)

## 1.0 REASONS FOR GOING TO M-PLUS

### 1.1 Shadow Disk

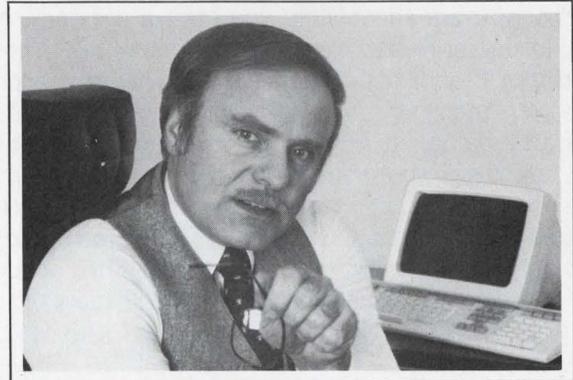

Our main reason for migrating from RSX-11M to RSX-11M-PLUS was the added capability of what is called "shadow disk." We have been, and still are, developing several large applications that will be handling volatile and sensitive data: an advertising accounts receivable package, and a display advertising layout package. Some of it, such as the ad layout data, is critical to the daily production of the newspaper.

In the newspaper computing world we have a saying: "THERE IS NO TOMORROW." In most computing applications in the event of disaster it is possible, although not desirable, to do it tomorrow. Getting out payroll a day late may be expensive, it may cause a lot of discontent, but in the worst case it can be done. Producing Tuesday's newspaper on Wednesday, however, simply cannot be done. For a newspaper, there is no "tomorrow." For applications involved in the production of the paper, therefore, data backup is imperative, and recovery in case of disaster, such as a head crash, must be nearly instantaneous. Typically, in newspaper applications, five minutes is considered a maximum recovery time. It may be nice in movies about newspapers to have someone screaming "Stop the press!", but in real life stopping the press is about the last thing you ever want to do. To stop the press because the computer has lost data necessary to the production of the next pages would cost so much that you could buy a complete secondary computer with the money. In fact, almost every paper I am familiar with has totally redundant computer hardware for just that reason.

What we needed was dual recording of critical data on two identical disk packs, so that if a head crash occurred, all that would be necessary to recover would be to boot up from the second disk. That is what "shadow recording" is. A complete, up-to-the-second, mirror image copy of your disk is maintained on another disk mounted on another drive.

We briefly considered a transaction log type of system, where any updates to files would be logged onto a disk or a mag tape. This required a lot of support software: each application would have to handle its transaction logging, programs would have to be written to recover from transaction loss and periodically purge them, and so on. Any new appli-

For Computer-Based Instruction  
on DEC\* Equipment...  
**AVID is for You.**

## Here's Why.

AVID, a comprehensive state-of-the-art system for computer-based instruction, operates on the PDP-11 under both RT-11 and RSX-11M, on the VAX under VMS, and the DEC Professional personal computers.

- **Easy for the Author.** AVID permits non-programmers to create lessons quickly using an English language dialog. The system provides comprehensive teaching aids to coach the author in lesson preparation.
- **Easy for the Student.** The student will enjoy learning with AVID because it's responsive and easy to control using plain English. Unlike other instructional systems, AVID allows the student to direct the system to the lesson or portion of a lesson that answers his question. When the interest level of the student exceeds the content provided in the lesson, he can skip elsewhere in the course to answer his questions. However, when desired, the author can limit the student's freedom of control.
- **Easy to Use in Other Ways.** Optimize the use of your computer even further by developing lessons to teach your operators how to use your system. AVID also manages and updates individual student records, handles graphics and other language-free input, and controls the administration of examinations.
- **AVID is Affordable.** Prices range from \$800 to \$5,500 based on operating system. Dealer inquiries welcome.

### AVID Makes It Easy.

CIRCLE D210 ON READER CARD

cation would have to include support of transaction logging, making all the applications larger. We rejected this approach in favor of M-PLUS and shadow disk because shadow disk is transparent to the application and requires no additional code. A nice side benefit of shadow disk from the viewpoint of operations is that it eliminates the need to copy the disk you are shadowing; you have a constant, on-line copy. In our brief experience with shadow disk, we have found that it adds little overhead to the system, especially when you funnel the shadow disk through a separate controller using a unique ACP. Remember, however, that if you have four disks you want to shadow, you will need eight disk drives! If the ability to recover from a head crash in five minutes instead of an hour, or much more (you know what it would take at your site), is worth the price of another drive, you should consider using M-PLUS shadow disk.

At THE RECORD we have experimented with combining the virtual disk package from the RSX SIG tapes with shadow disk. This allows us to designate selected sets of files that have been assigned to virtual disks which are located on several disk drives, for shadowing on a comparable set of virtual disks that have been located on a single "shadow" drive. We have limited the files to be shadowed to the critical few instead of duplicating entire disk packs, and have been able to reduce the number of drives needed to shadow those files.

M-PLUS supports overlapped seeks for disk. This feature allows multiple disk units attached to a single controller to perform seeks (head movement) simultaneously, although only one data transfer can occur at any one time. Most advanced disk controllers support this feature, as ours do. Since we anticipated an operations environment where up to eight drives might be accessed through a single controller, it seemed to us that overlapped seeks would be a considerable help to disk throughput. In our current operations we rarely have more than two drives operating through a single controller, and in most cases we are operating on just one drive, so we have no concrete data yet on savings through overlapped seeks.

### 1.3 Supervisor Mode Libraries

Available only on 11/70's and 11/44's under M-PLUS, supervisor mode libraries are resident libraries that double a user task's virtual address space by mapping the instruction space of the processor's supervisor mode. That was a near quote from the Executive Reference Manual. For those of you haven't yet learned to speak DEC, let me give a rough translation. A task or program under RSX-11M is only allowed to have 32K (roughly 32,000) words of memory to run in because the hardware can't count any higher than that. Supervisor mode is like a second counter, allowing another 32K locations to be used. For a little memory overhead in your program and some run time overhead when your program has to switch modes to get at the stuff in the supervisor mode library, you can double your program size.

That was important to us because we are converting a number of programs from an IBM 370 with virtual memory to run on our 11/70. Most of them were just too big to run without overlaying and breaking them up into subtasks,

with the attendant overhead in increased execution time. Supervisor mode libraries give us the ability to build bigger tasks. In addition, many of the DEC utilities can be built using a supervisor mode library for File Control Services (FCS). That makes those commonly used programs smaller, and for the larger ones that require a lot of overlaying under RSX-11M, allows DEC to reduce the overlaying, thus reducing the number of overlay calls from disk. In summary, the utilities are smaller and run faster. The option of building FCSFSL utilities is offered during SYSGEN, and I advise you to take it.

### 1.4 Secondary Pool

Under RSX-11M we had frequent system crashes when we ran out of pool. For you new users, "pool" is a space in the executive used by the system as a work area to contain data structures such as system lists, control blocks, and I/O packets. Every file that is open has a file control block in pool each installed task has a task control block; active tasks have task headers in pool; each terminal has a user control block, and so on. There's a lot of stuff in pool and only a limited space in the exec. When it fills up, the system crashes.

How many of you RSX users have experienced that problem? Before M-PLUS we tried lots of tricks to get more pool or to keep from crashing. We installed the Pool Monitor Task from the SIG tapes; we put in patches from Jim Downward at KMS Fusion that allowed us to run with fewer tasks installed; we put in a patch to the terminal database to reduce the number of SCB's for terminals. Each thing helped a little, then we'd run out of pool again as the load increased.

Under M-PLUS we have yet to come close to running out of pool space. One of the main reasons is secondary pool. Secondary pool is a memory partition that is outside of the executive, and it can be as large as you want. M-PLUS uses it for more permanent or less frequently used data structures, and thus frees up that space in primary pool. Task headers, for example, go there, so under M-PLUS there is almost no limit to the number of tasks you can install. We have a pool problem under M; no longer. We come up with over 11,000 words of primary pool. We'll run out of memory long before we run out of pool. PMT seems almost superfluous under M-PLUS. But we can (and will) buy more memory! You could never buy more pool.

### 1.5 Directive Common

Directive Common is another way you get more pool space. Some of the executive directives are moved into a common partition thus freeing up more space in the exec.

### 1.6 Multi-User Tasks

Our system has lots of users. We anticipate having up to 52 terminals on a single 11/70. That many users can fill up memory with tasks awfully fast. M-PLUS allows the building of multi-user tasks, in which a single copy of read-only portions of a task is shared by many users. Even on our development system, the multi-user versions of EDT and PIP have helped reduce checkpointing in the system. We are making some of our application tasks multi-user also.

## 1.7 Multistream Batch Processing

We wanted batch processing so that users could schedule long, time-consuming tasks to be done in off hours. Batch allows you to do this. In effect you submit a command file to the queue manager just like a print job: SUBMIT MY JOB/AFTER:17:00. Also, when development gets really heavy we can ask users to submit jobs to batch streams rather than running them directly, thus limiting the number of simultaneous compiles and task builds.

## 1.8 Task and User Accounting Capability

We expect our system to overload before long even under M-PLUS. When that happens we will be able to use the resource accounting facility to determine which tasks are overloading the system, and with what kind of activity: CPU, disk, QIO's, etc. It is possible that we may develop a charge-back system to our user departments.

## 2.0 TRANSITION PROCESS FROM M TO M +

I would say we had a rough transition, but largely because of two factors. First, we elected to migrate at exactly the time DEC was discontinuing version 1.0 and starting on version 2.0. For several months we couldn't get either version from them. Finally they delivered version 1.0; about six weeks later we got version 2.0. We had barely adjusted to version 1.0! Second, we had all non-DEC disks and disk controllers. It's very hard to SYSGEN a system when you can't run any of your disks on it. We ran our version 1.0 GEN from our RSX-11M 3.2 system, and then GEN'ed our version 2.0 using the version 1.0 system. Before starting the GEN, we had to modify SAVE, the DB driver, other utilities and the SYSGEN command files to compensate for our foreign controllers. It was frustrating because we spent weeks debugging code for the disk sub-system without being able to see the new system at all. We read the manuals and dreamed great dreams; meanwhile we couldn't even boot the thing. If I were back buying our system in the first place, I would include at least one standard DEC disk system for doing SYSGEN's if for no other reason.

One nice thing is that DEC had included very clear instructions on how to GEN a version 2.0 system from a version 1.0 base — just what we needed. They even have a special command file for doing it, letting you build the 2.0 versions of MAC, TKB and IND that you need for the GEN on your version 1.0 system. We did it and it works. In general the version 2.0 SYSGEN manual is much clearer, and the SYSGEN procedure is much simpler than any I have done before. Autoconfigure is a new thing DEC has added that eliminates the messiest part of SYSGEN: specifying CSR's and vectors for all your hardware. autoconfigure just goes out there, probes around the system to figure out what hardware is attached, and generates all that stuff for you. It then allows you to examine and edit the results in case it goofed or left out something it couldn't recognize. If you have a system put together by DEC with mostly DEC hardware, use autoconfigure; or if you know your CSR'S and vectors meet their standards, use it. Our CSR's and vectors are definitely non-standard even for the DEC gear (the system was put together by an OEM), and we found it more convenient not to use autoconfigure, so I can't say how it works.

## 3.0 PROBLEMS ENCOUNTERED IN SYSGEN

### 3.1 Bugs in Building the Executive

The command file SGNBE.COMD has a bug in it that DEC knows about. When the exec finishes task building the command file attempts to wait for the cross-reference to complete with the statement:

```
.IFINS CRF... WAIT CRF...
```

For some reason this causes an error message saying 'SPAWN FAILURE' and the SYSGEN command file aborts. The only thing that fails is the indirect command file. The task build of RSX11M has worked fine. All you really need to do is make sure CRF has finished and continue with the GEN. I checked SGNBE.COMD, and the only remaining executable line was "TKB @DRIVERS". So I typed that in directly, waiting for it to complete, and then re-started the SYSGEN at the next phase after "Build the Executive and Drivers." Worked fine. You could modify GNBE.COMD (see note on SYSGEN command files below under "Hints from our Experience") by commenting out the line at fault and replacing it with a ".PAUSE". When it pauses, just check active tasks. If CRF . . . is not active, then resume. DEC software support suggested removing CRF . . . before starting the build of the exec, but that seemed counterproductive to me. This bug occurs only when building a 2.0 system from a 1.0 system, so you may not see it.

### 3.2 Getting Correct Versions of Non-Privileged Tasks

Pay close attention to the note on page 3-63 of the SYSGEN manual. If you make any changes to the task build files to select options on some of the non-privileged tasks, and you fail to move them from [1,54] to [3,54] after they are built, you won't get your tailored versions of those non-privileged tasks when you bring up the system. The versions of those tasks from the distribution tape are in [3,54]. The versions you build, for some reason, go into [1,54]. When SYSGEN creates SYSVMR.COMD file, it specifically installs non-privileged tasks from [3,54] so you get the DEC originals, not the ones with the options you so carefully chose. DEC should build non-privileged tasks into [3,54] if that's where they expect them to be, and I have complained to that effect in an SPR.

## 4.0 HELPING THE USERS ADJUST

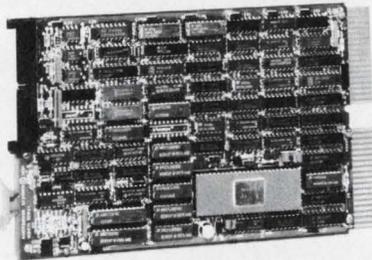

Some of these things probably apply equally well to new users of RSX-11M version 4.0. In general the transition for the users of our system was painless, but not without some effort ahead of time and behind the scenes.

### 4.1 Getting Used to Digital Command Language

For someone coming to M-PLUS from M version 3.2, DCL is something new. We elected to put in DCL as the primary command line interpreter (CLI) and to modify the task build file (see below) to select the option to allow any unrecognized commands to fall through to MCR. If you don't do that, any user of DCL is going to be extremely annoyed when typing PIP fileA = fileB/RE elicits an "UNRECOGNIZED COMMAND" message. You can't get directly at anything through DCL, not even PIP, unless you enable the fall-through-to-MCR option in the task build. Overall falling

# GET THE POWER YOUR Q-BUS SYSTEM WAS DESIGNED TO GIVE

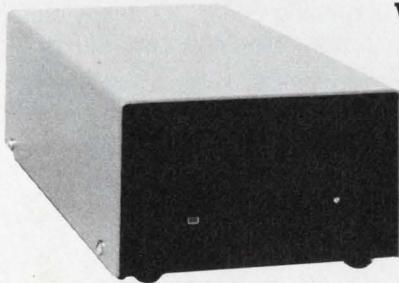

It's Plug-In Simple with Remarkable DEC-Compatible  
Technology from Andromeda Systems

## The WDC11 Triple Function Compatible Controller: Its Power is Amazing Versatility

Interfaces with 8- and 5¼-inch Winchester and floppy disk drives, and includes an intelligent bootstrap ROM. This LSI-11 compatible Controller emulates these standard DEC devices: RK-05, RL-01/2, RP-02, RX02.

That's only a **sampling** of the freedom of selection you have with the WDC11 Controller. It adds performance to your LSI-11 computer system. Easily and cost-effectively.

## Winchester Add-On Subsystems: Their Power is Speed, Storage Capacity, Reliability, Compactness, and Low Cost

Get major throughput gains from your LSI-11 floppy-based system at a cost you can live with. Andromeda's popular MDS series, with a 5¼-inch Winchester drive, has a data transfer rate **over eight times** that of an RX02 floppy! Standard DEC emulations are available. Includes built-in bootstrap and formatting.

All Andromeda Winchester Subsystems will quickly and conveniently cover your mass storage needs for today and tomorrow.

## Complete Turn-Key Computer Systems: Their Power is Big Overall Performance for Small Space and Cost

One totally integrated package includes computer and disk drives. For example, the 11/M1-W (pictured) holds a standard 5¼-inch Winchester disk drive, 2 x 5 card cage, control panel, and power supply.

Andromeda Turn-Key Computer Systems are easily expandable, and may be custom-configured to fit your processing requirements, space constraints and budget. Specify 8-inch disks if you wish, or dual drives, or floppies...or a combination.

**Andromeda is the Q-Bus specialist. Our single objective is to develop fine products that unleash the power that is inherent in your DEC LSI-11 system.**

through to MCR works fine; people used to MCR just go on using it as they always did and never know DCL is there until they get around to reading the new manuals. Almost. There are a few problem spots where MCR and DCL use the same command, as in SET, MOU, MAC, FOR, and INS. A user enters a familiar command like "MAC FILE=FILE" and is given the error message:

MACRO — Extraneous input

MAC FILE=FILE.

That's DCL complaining, because its syntax is different. Simply alert your users that if familiar commands don't work, they should try them with a dot in front of them. For example ".MAC FILE=FILE" will work just fine. The dot tells DCL to schlep the command off to MCR without even looking at it. If they're going to do a lot of that sort of thing, they can set their terminals to MCR as primary CLI with set terminal MCR. In general, SET TERMINAL MCR and SET /DCL=TI: should be the first two new commands you teach your users if DCL is in your system.

### 4.2 Command File Execution

If a terminal is running under DCL many old command files won't work if they use MCR commands like "MAC FILE,FILE/-SP=FILE" because "MACRO" is a DCL command expecting DCL syntax. I happen to like DCL, so what I do is put this into my command files:

```
.setf DCL
.if <CLI> = "DCL" .setf DCL
.ift DCL SET TERM MCR
```

contents of old command file

```
.ift DCL SET /DCL=TI:
```

That could be more generalized if you plan on multiple CLI's:

```
.SETF MCR
.ENABLE SUBSTITUTION
.SETS CLI <CLI> ! Save starting CLI !
.if CLI NE "MCR" .setf MCR
.iff MCR MCR SET /MCR=TI: !Assumes MCR command in all CLI's!
```

```
.iff MCR SET /'CLI'=TI: ! Restore starting CLI !
```

### 4.3 Hints to KMS CCL Users

We still use CCL. It works fine. We have three command line interpreters: DCL, MCR, and CCL. DCL comes first; any unrecognized commands fall through to MCR; finally, CCL is installed as CA. (catch-all) to handle anything MCR does not know. All I did was rebuild CCL.TSK on the new system, and since CCL is not privileged, even that was probably unnecessary. None of the Jim Downward patches to system routines were made; most of them exist in MPLUS as distributed. One Downward patch to MCR we miss was the one that forced it to pass everything to CCL (instead of kicking out things like "?" and "LI"). When we want to add a new command it is still ever so much easier to edit two or three lines into SYSCLL.CCL than to master the complex syntax required to build a DCL command table entry, edit the file, assemble it, and double task build DCL!

The /CMD parameter to RUN is not exactly like the old KMS /PRM parameter: it expects the task name in the first

four characters. In other words, it clobbers the first four characters you pass. You must say:

```
RUN $MAC/CMD = "MAC FILE=FILE"      instead of
RUN $MAC/PRM = "FILE=FILE"
```

The CMD parameter does not exist for INSTALL, as PRM did in the KMS mods. One strange annoyance is that you cannot pass parameters to an installed task from the RUN command using CMD; to use RUN/CMD the task must be non-installed.

#### 4.4 New Introduction Manual

"The Introduction To RSX-11M-PLUS" book and the accompanying files in [200,1] are a great training aid for new users. I did find some of the examples in the book did not work; some files used in the text were missing, but were easy to provide. Mostly they were one-line text files used to illustrate several commands like TYPE and PRINT. Nothing major was missing. I suggest you run through the book yourself before handing it to a new user, and fix the things that don't work. Even your old hands should work through this because they will learn DCL and other stuff they probably never knew or have forgotten (e.g., EDT line edit mode for people who always use keypad). One outright error: the manual says the EDT command "T LAST" types the last line of a file; in fact it types the last line referenced. The command should be "T END-1".

#### 4.5 Queue Manager and Error Logger

The Queue Manager and Error Logger commands have changed entirely from anything you ever knew. God knows they needed it, but be warned and spend some time looking through the documentation before turning the system loose on your users. You may want to write some memos to frequent users and computer operations personnel, or hold some re-training classes. At least alert them to the excellent HELP files and how to find them.

If you have any command files that are used to make error report generation easier, throw them out. They'll be useless. Be prepared to rewrite and to find that it is easier this time. I wrote a file called ERRORS.CMD for our operators to use (it will be in [333,100] on the SIG tape) that walks them through most of the options. The canned report option for the error log REPORT GENERATOR did not work.

You are supposed to be able to enter:

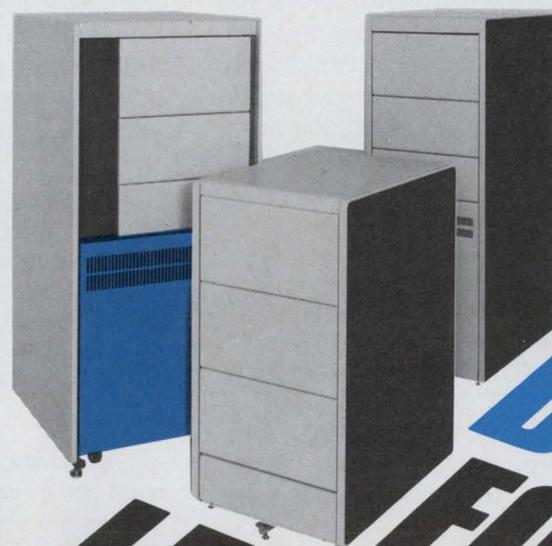

```
RPT /RE:DAY
```

to get a full summary report on all today's errors, for example. It bombs. My ERRORS.CMD file could not make use of this switch, unfortunately. I have SPR'ed this; DEC, however, can not reproduce the problem.

### 5.0 HINTS FROM OUR EXPERIENCE

#### 5.1 Multi-Path Access to Disks

Setting up procedures for proper handling of dual-ported disks, disks that in addition are accessible from two

Look

CIRCLE D198 ON READER CARD

or three CPU's simultaneously, was very complex. We have three CPU's, three controllers, and six drives. The disks are each connected to two of the three controllers, and all three controllers are connected to all three CPU's. There are two paths to each disk from each CPU.

M-PLUS allows you to specify disk drives as dual-ported. Since that is what we have physically, it seemed to make sense to tell the software about it. It took us weeks to find out all the things that could go wrong. We found no actual bugs in the software, just mass confusion for us as users.

One rule of thumb: DON'T LIE TO THE SYSTEM. If you SAY there are two paths to a disk there damn well better BE two paths. You see, we have this nice switch panel that can put individual ports on a controller offline . . . Well, if the second path for DB2: is switched offline, and you try to MOUNT DB2:, mount will time out. If you're booting from DB2:, tasks will start getting load failures in STARTUP right after CON ONLINE ALL is executed (more on the CON tasks below).

We also found (with CDC drives and SI controllers) that dismounting a pack on one CPU could knock it offline for another CPU as well. We had one CPU booted from DB5:. A user on a second CPU mounted DB5:/NOWRITE (that's a new switch on MOUNT that is very useful), and when he was done, he dismounted DB5: like a good user should. Bang! Down went the first CPU. For some reason, even though our drives look like RPO4's to RSX, the dismount command is trying to unload the disk! And for some reason the disk seems to recognize it even though it can't be unloaded from software (could be a hardware bug). We finally discovered that, to be safe, we should mount disks with a new switch, /LOCK=N, which sets the default for dismount to "no unload." That way users don't have to remember to use DMO DBn:/LOCK=N. We set up a MOUNT.COMD command file and have everyone use it to mount a disk so the right switches are always used.

Another switch useful in multi-path situation is /LRU=0. Whenever we mount a disk /NOWRITE we also add /LRU=0, which instructs RSX not to cache directories in memory but to always read from the disk. That may sound inefficient, but when we mount a disk /NOWRITE it is usually because it is mounted for writing from another system. Directories can get strangely out of sync when one system is writing to a directory and another thinks it has the directory cached in memory! What we really need is a mechanism that COMPLETELY PREVENTS a disk being mounted for writing from two systems at once. We have done that, of course, and the result is hundreds of multi-allocated blocks as each system blithely writes using its own copy of the bitmap of free blocks. One useless disk and lots of grouchy users. We are currently working on some mods to MOU and SAV to accomplish this.

## 5.2 CON, the System Reconfiguration Task

The System Reconfiguration task is both an enormous boon and a colossal pain. This task enables you to place devices in your configuration either on or offline by software command: CONFIGURE OFFLINE DBO:, for example. You can also display and even change CSR's and vectors! This affords great flexibility, but there is a whole new command set to learn.

The pain comes from what I said above: DON'T LIE TO THE SYSTEM. RSX-11M users are used to being able to do peculiar things like spinning down one disk and spinning up another in its place without dismounting it from the system. M-PLUS won't let you do that; the minute you touch the button it dismounts the drive automatically. This particular protection is, I suppose, good. But sometimes I want to lie to the system! Like when I blow a home block on an otherwise good disk and want to recover its files. I've kept a Version 3.2 pack around just so I can play that game.

A related difference is the fact that under M-PLUS any access to mag tape requires that the tape be mounted. To initialize a tape you can't just allocate yourself the drive and initialize; you allocate it, MOUNT it /FOREIGN, and then initialize. Same with BRU and other utilities that used to access unmounted tapes and disks under RSX-11M. No more. You have to MOUNT /FOREIGN.

In general M-PLUS forces you to be more careful about what you do with the hardware and to tell the system using CON before you do it. If you are going to switch an access path to disk offline, we first must CON it OFFLINE. Makes sense, but at first it creates strange situations for someone used to M.

## 5.3 Task Build Options

Before building non-privileged tasks, I recommend you search through all xxxBLD.BLD files in [1,20] for all the GBLPAT and GBLDEF lines to see for yourself what options you have in task building the various utilities. These are command files used by SYSGEN to create xxxBLD.COMD files in [1,24] for the related task builds. For example, PIPBLD.BLD contains switches to select options for PIP.

There is a point where SYSGEN pauses after creating the command files in [1,24] and asks if you want to edit any of them, and you could wait until then and then do your editing. However, if you re-run SYSGEN for any reason, you'll have to repeat the editing. In addition, you can, if you wish, build three versions of many utilities, one regular (overlaid), one using FCSRES, and one using FCSFSL. Then you have to edit three command files in [1,24]. If you edit the xxxBLD.BLD files in [1,20] before starting the non-privileged task part of SYSGEN, then your options will automatically be included in all three versions every time you do a GEN.

**5.3.1 PIP** — For example, PIP is advertised as having the option to preserve creation date on copies, but nowhere does it tell you that you must edit a global in the PIPBLD.BLD to obtain this option.

**5.3.2. INDIRECT** — The Indirect Command processor also has nifty options. For example, you can have it default to the system UIC (or another you designate) if the command file is not found in the user's UIC; once again however, you must edit the Build file to get this. IND is now called ICM just to confuse you.

**5.3.3 DCL** — DCL has a couple of options, most useful of which is allowing unrecognized commands to fall through to MCR. Edit [1,20]DCLBLD.BLD to get it.

**5.3.4 Other tasks with options** — Tasks I found having build file options:

DMP	CMP	AT.	LPP	MAC	PIP	PRT
QCL	QMG	RMD	SHA	TKB	ACN	BYE
HEL	LBR	RPT	SAV	DCL		

**6.0 MISCELLANEOUS COMMENTS**

The ability to broadcast to users by name is nifty: finds them even on multiple terminals. The sample DIR reports for Resource Accounting are excellent tools for producing your own customized reports. All of the accounting records are now accessible through Datatrieve.

In general, MPLUS is easier to manage for an unsophisticated user because it translates more of what you need to know into human-readable form. Be aware that under M-PLUS a task named "...XXX" NEVER RUNS; it is a prototype task only. When TTO runs it by saying "XXX", it gets a task called "XXXTO". If you have any command files that try to do ".WAIT ...XXX" they will no longer work. Such tasks are not intended for multi-terminal use and should be installed with task names not in the form "...XXX".

SIG programs we build under MPLUS (versions on SIG tape): SRD (multiuser, non-overlaid), TECO, UIC, LIST, GREP, COOKIE, RNO, DOC, DUNGEON, C(SCC), PREDAY, TYPE (renamed TIPE), TREK, TCF, BRUDIR, SRDCMD (CMD), ADVENT, RMC, LUT, USERMN, TRUNC, RATFOR, PACMAN. Most require no modification, only a few require other than minor mods to the build files. The HELP files on version 2.0 are fantastic, in some cases more accurate than the manuals. I wrote three TECO macros, HDX, HFL, EDH, and TEH (all with both TES and TEC extensions), to help me step through all of them and index what is there. See [333,100] on the current RSX tape. (The text of this article — possibly with updates after 15-OCT-82 — will be there too as M2MPTALK.DOC.)

[Editor's Note: The Sig Tape that AI refers to is that produced by the RSX SIG at the most recent DECUS Symposium, Fall 1982 (Anaheim)]

# For DEC\* Computers, 100% Compatible.

## For DEC Owners and Users, 100% Essential.

**Thousands of New Products.  
100% DEC-Compatible.**

All the latest hardware, software, services and supplies designed to run on your DEC computer. All the DEC-compatibles you've read about, heard about, but have never seen demonstrated. Plus, thousands more. Newer and better than anything on the market today. More DEC-compatibles than at any other show in the world!

\*DEC and DECUS are registered trademarks of Digital Equipment Corporation.

**Over 250 Vendors.  
100% DEC-Friendly.**

Meet the vendors who can help your DEC system reach a new standard of performance. Because you never have to ask, "Is it DEC-Compatible?" you get fast answers to the really important questions. It's the one Show for everyone who owns, manages, or uses a DEC computer. So bring the entire decision-making team: top management, financial management, DP management and senior staff.

**Especially for DECUS\*  
Conference Registrants.  
100% Free.**

It's easy to attend DEXPO East 83. And hard to miss. Especially for DECUS members attending the St. Louis conference. Free shuttle buses will take you from the Show to the conference in just five minutes. And conference attendees will be able to use their DECUS badges to enter the Show without paying a registration fee.

# USING A RESIDENT LIBRARY FOR COMMUNICATION BETWEEN JOBS

By Robert Grund, Street Software Technology

## INTRODUCTION

Prior to the introduction of resident libraries, communication between jobs was typically performed by means of disk I/O or 'send/receive' sys calls or pseudo keyboards. All of these methods are inherently inefficient. Furthermore, a job which employs any of these methods might stall for an unpredictable amount of time until system resources become available.

With the introduction of resident libraries, it is possible to implement a send/receive protocol which is both efficient and which does not require the sender to wait for system resources such as small buffers, 'FIP' or disk. Furthermore, the sender and receivers are not required to wait for each other. The time period in which a receiver reads a message can overlap the time period during which the sender writes a new message.

## DESIGN OVERVIEW

A resident library is used to construct a message queue. Only one job, the sender, has write access to the queue. One or more receivers have read only access to the queue. A protocol is needed to coordinate access to the queue. The protocol described here has the following properties:

1. The sender is allowed to execute independent of the receivers. A receiver will not stall the sender.
2. The receivers will only stall while waiting for a new message. A receiver will not stall another receiver.
3. The average rate at which a receiver extracts messages must not be less than the average rate at which the sender produces messages. Otherwise, the receiver will lose messages.

The BASIC PLUS 2 common statement is used to structure the message queue as an array. Successive messages are stored in consecutive rows in the array. Each row of the array consists of two parts. The first part is a sequence number which is increased by one for each message stored in the buffer. The second part contains the message. Once the queue becomes full, the next message is placed in the first row destroying any data which was there. In effect what we have is a race where the receivers chase the sender around a circle. The receivers are not allowed to overtake the sender. The sender is allowed to overtake a receiver in which case the receiver will lose data.

## SENDER IMPLEMENTATION

```

1000 COM (MSGQUEUE) QSEQ(155%), QDATA1(155%), QDATA2(155%)
2000 QSEQ = 0.0      ! INITIAL SEQUENCE NUMBER VALUE
      \ QSIZE = 156. ! QUEUE SIZE
      .
      .
      .
5000 T% = FNQUEUEMSG( 10., 20. )
      ! QUEUE THE MESSAGE '10., 20.' IN QDATA1(), QDATA2()
      .
      .
      .
20000 DEF* FNQUEUEMSG( QDATA1, QDATA2)
      !&
      !&
      !&
      ! QUEUE A MESSAGE
      !&
      !&
      !&
      !
20010 QSEQ = QSEQ + 1.0
      ! MESSAGE SEQUENCE NUMBER
      \ L% = QSEQ - (INT(QSEQ/QSIZE)*QSIZE)
      ! L% IS QUEUE LOCATION WHERE MESSAGES IS PLACED
20020 QSEQ(L%) = 0.0
      ! A NEW MESSAGE IS BEING PLACED IN QUEUE LOCATION L%
      \ QDATA1(L%) = QDATA1
      \ QDATA2(L%) = QDATA2
20030 QSEQ(L%) = QSEQ
      ! A NEW MESSAGE HAS BEEN PLACED IN QUEUE LOCATION L%
20040 FNQUEUEMSG = QSEQ
      \ FNEND
  
```

## RECEIVER IMPLEMENTATION

```

1000 COM (MSGQUEUE) QSEQ(155%), QDATA1(155%), QDATA2(155%)
2000 QSEQ = 1.0      ! INITIAL VALUE OF SEQUENCE NUMBER
      \ QSIZE = 156. ! QUEUE SIZE
      .
      .
      .
5000 T% = FNGETMSG
      ! GET A MESSAGE IN QDATA1() AND QDATA2()
      .
      .
      .
20000 DEF* FNGETMSG
      !&
      !&
      !&
      ! GET A MESSAGE
      !&
      !&
      !&
      !
21010 L% = QSEQ - (INT(QSEQ/QSIZE)*QSIZE)
      ! L% IS LOCATION OF MESSAGE IN QUEUE
21020 O.QSEQ = QSEQ(L%)
      \ IF O.QSEQ < QSEQ THEN
      \ SLEEP 1%
      \ GOTO 21020
      ! LOOP UNTIL A NEW MESSAGE IS AVAILABLE
21030 QDATA1 = QDATA1(L%)
      \ QDATA2 = QDATA2(L%)
      ! EXTRACT MESSAGE
21035 IF O.QSEQ <> QSEQ(L%) THEN
      \ SLEEP 1%
      \ GOTO 21020
      ! DATA LOST! SORRY! TRY AGAIN!
21040 QSEQ = O.QSEQ + 1.
      \ FNGETMSG = QSEQ
      \ FNEND
  
```

## CONCLUSION

The implementation described above was motivated by an application which computes yields for government securities from real-time prices. The prices are embedded in messages which are transmitted to the computer over a 2400 baud simplex line. The prices are extracted from the messages by a complex parser. The prices and the corresponding yields are stored in a data base which is accessible to a variety of display and/or computational programs. The first attempt at a solution used disk to store the data base. This turned out

to be infeasible on a heavily loaded system. From time to time the program got 'stuck' in a long disk queue which resulted in loss of data from the 2400 baud simplex line. The second attempt at a solution used the resident library protocol described above. This turned out to be a feasible solution. Data loss has been almost eliminated. Furthermore, CPU usage was reduced and disk I/O was eliminated. This in turn caused a noticeable improvement in the overall response time of the system.

4

## PORTACALC

. . . continued from page 92

### NOTE:

If you get this program working on a non-PDP11, non-VAX, the author would appreciate a (machine readable) copy of the modified version.

### BUGS:

The functions here are mostly tested, but some bugs may remain. FORTRAN formats are used and any format entered will be used. If you put something in that FORTRAN can't understand, you lose. Conversely, you can use things like O or Z formats for octal/hex or whatever you like. Formats A and L by themselves mean "display the formula itself"; anything else means "display the number." On entering numbers, any formula containing the characters ".", "[", "+", or "-" is treated as a numeric; anything else is treated as a formula. The DF command can fix this up if it's not what you want. Note too that the multi-argument functions:

SUM[args]	Sum
MAX[args]	Maximum
MIN[args]	Minimum
AVG[args]	Average
STD[args]	Standard Deviation

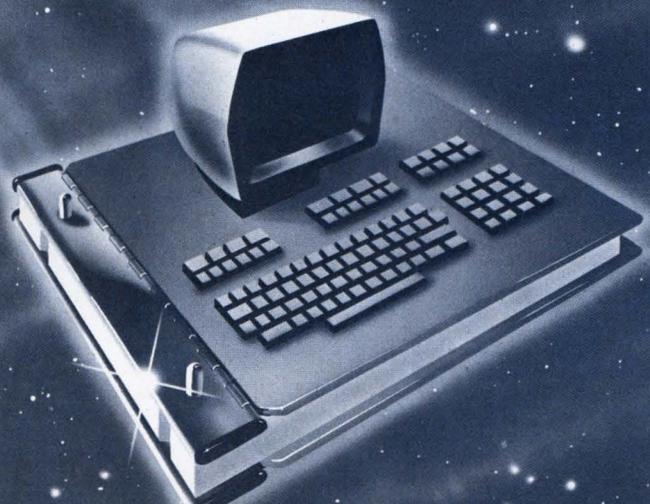

and the statement

IF [v1.RL.v2]true-statement|false-statement must appear at the start of a formula or formula substatement (substatements are delimited by \ characters) and the value goes into the current variable cell (which is universally named P## if you want something location independent). It's a good idea to include an else statement in IFs since something gets put in otherwise.

# THE ELEMENTS OF SOFTWARE SUPPORT: THE SOFTNESS OF SOFTWARE

By John M. Gram, Data Processing Design, Inc., Placentia, CA

In the last issue I began a series on supporting software products. To be perfectly honest, committing my ideas (and ideals) to print frightens me. My fear lies primarily in the gap that exists between what can be done in supporting software and my ability (or inability) to make it happen. I'm sure this is a common apprehension. In some cases, corporate restraints can also limit your accomplishments. But even if you were a superhuman with the greatest ability, too many difficulties would creep into your best efforts. Do not be discouraged. These efforts must be made, regardless of what impact company policies, or politics, may have upon them. Effort should be made to begin a dialogue, to encourage a vision for better products and education in their use, to make clearer appropriate roles for both client and vendor. While the difficult support issues are dealt with every day, the impossible ones take just a little longer. My hope is that this series will influence you to join me in attacking the problems related to the support of software.

As we begin this series we must consider the nature of the product and its means of distribution. Software has been appropriately named. It seems to be intangible, yet its value is without question. References to software are becoming commonplace. Even Sony has begun to market a laser disk for audio play, referring to the music on the "records" as software. Yet if you try to explain what software is to someone unfamiliar with computing you'll be amazed at how difficult it is. You might think that anything of value, something nearly intangible, must certainly be complicated to support. Or is it?

For years software was given away by manufacturers of computers. In the earlier days of computing no one would have bought a computer for its programmable potential. The relative expense and rarity of computers called for an up-and-running product. Software is, after all, necessary to make the mass of steel and silicone function. And yet, little software was available other than a basic operating system, a few utilities, and perhaps a FORTRAN compiler. As computers continue their migration from laboratories and research centers into everyday businesses, the demand that computers be adequately equipped with software increases. However, the software will not come without cost. Nor will the software cost be hidden in the hardware profit. As the demand for more sophisticated software increased, so did the demand for more powerful hardware to run it on. The increase in technological advances led to specialization and the division of hardware and software products. This attitude in the marketplace opened up new opportunities for companies specializing in software.

Digital has always seemed most interested in providing hardware. Typically, they rely on their distributors to add value to the hardware they sell. The added value is application software. This does not mean that Digital does not provide software; they do. However, their primary business is selling machines. And, for the most part, the software they provide is made up of operating systems, utilities and languages. Specific applications are largely left to independent distributors. As computers are becoming more commonplace, the quality and sophistication of software products continues to increase naturally through competitive marketing.

Manufacturers have begun to "unbundle" software from the purchase of equipment and purchase of the operating system. Some manufacturers even lease software (without option to purchase). Salaries of computer related professionals have soared, and the willingness to share software without cost has faded. Even the courts (and franchise tax boards) recognize software as a real product. As these trends began to develop, software houses began to flourish. Custom programming began to give way to quality packages, making the price of programming more affordable.

Equipment continues to become less expensive (in relation to capability) while in-house programming of software continues to increase in cost because of the manpower required and the salaries commanded. As smaller computers become more powerful and can handle larger programs and more data, the possibility of off-the-shelf packages that also meet specific requirements will dominate. Nevertheless, continuing requirements for operator training, on-screen instruction, readable documentation and access to support centers will be required.

Because software is easily sent through the mail, UPS, or overnight couriers, the temptation to change it regularly is appealing. From the perspective of the user, the ease of completely updating software leaves little excuse for errors existing in software for any extended period of time. After all, many representatives at user sites are experienced in maintaining programs — that's their job. In a matter of minutes they can detect failing software, analyze the origin of the problem, correct the error and place the new software into service. No words can capture the frustration these people feel when they lack source code for vendor provided software. And, unfortunately, solutions to problems cannot be provided by the vendor as quickly as an in-house effort for a home-grown product.

Dealing with customers who also sell and maintain software products can be exasperating. Especially difficult

is the discussion with those claiming that their software is more complicated than yours and they are called upon to provide immediate fixes. In some environments, such as manufacturing systems, immediate response is necessary. However, most vendors of such software will reluctantly admit that this type of software costs much more. The initial startup costs have been bundled into the cost of the software. And, maintenance costs are usually higher. No, it is never impossible to solve a software problem. By throwing enough money and effort at a problem it can be overcome. But everyone involved must evaluate the costs and ask themselves honestly how much they are willing to pay for what they require. In general, if all costs and trade-offs were known, less demand for site-specific changes of software would occur.

### The Payoff of Software Support.

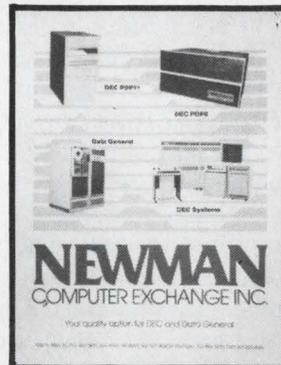

There are very tangible benefits to vendors who provide quality software support. The primary long term payoff is survival. Legitimate businesses that intend to stay in business must establish standards that they intend to live by. Why is quality support worthwhile? Several good reasons that should encourage software houses to emphasize a high level of support are: it promotes a better product, it creates a reputation that will sell new products to existing customers, it provides good references for new customers, it allows financial growth, and instills good customer relations.

Hopefully you're committed to the concept that support is necessary and desirable; there are definite payoffs. But how does a vendor finance the support effort? Actually, there are several methods. The most important consideration is to remember that some cost can be eliminated by anticipating and budgeting product support. By committing to support a product during the product planning stages you reduce more extreme costs involved in excessive patches and data recovery. Prevention is much less expensive than cure. Fighting fires is very expensive; it often means physically visiting the customer site, and the expense of phone calls (both voice and dial-up). There are hidden costs in not supporting a product. Don't be deceived. While the costs may be difficult or impossible to calculate, they are very real and very great! If expenses must be incurred, why not spend them in planning and providing support before product release rather than afterwards.

Secondly, I think that vendors can (and should) include training costs in the maintenance cost of their products. At my company, we charge an annual fee for the support of our products. It's not an uncommon thing to do. In that support fee we include some training. This is beneficial because the educational process eliminates a lot of the need to fight fires. Training promotes more than a knowledge of the product; it also energizes those using the product to more imaginatively expand its use. Training can also encourage everyday users to read the documentation. Very often, users do not acquire the habit of reading documentation. Training does not substitute for judicious use of manuals, but it does eliminate much of the fear and provides instruction in their proper use. Well trained users reduce the liability in supporting a software product.

We charge an annual maintenance fee for our products. We believe that software support is a product itself. Customers benefit from it, and it is reasonable to expect payment for it. Just as in selling any other product, it is not unreasonable to make a profit. Profit is the reward for a job done well. In general we charge about ten percent of the product's purchase price as an annual maintenance fee. This includes software updates, response to problems that are reported, patches to serious problems, and educational opportunities. We charge for support and our customers appreciate the service. In general, they consider it a good investment.

For small software companies, costs can be reduced by using the same people for both initial training and the support effort. There may be times when this method strains the available resources — but it does provide an affordable beginning. And it has several benefits. To begin with, by sharing the on-site training and in-office telephone support responsibilities, you reduce the amount of traveling required by your staff. Additionally, your staff gains insight by performing these complementing responsibilities. Invaluable feedback about what to cover in future training sessions can eliminate support problems. While this method works well in early stages for smaller companies, it may make sense to separate them later as funding allows.

Another way to finance a support staff from humble beginnings is to sell your product through distributors and require them to provide training and support. We have distributors for our products world-wide. This has paid off in many ways. The agent who sells the product is responsible for the installation, the training and the support followup. We couldn't sell our software in some places without the distributor. While this is not necessary for all sales, customers often feel more secure when a representative is located near them. At times, more adequate training and support can be provided through a distributor in distant areas (especially in other countries). For some, this proximity is not a major consideration. In fact, some customers prefer to deal directly with a supplier rather than worry about coordinating through a third party.

CIRCLE D213 ON READER CARD

There are drawbacks to distributor programs. Vendors must scrutinize potential distributors to insure that they will invest a reasonable amount of their "profit" into staff for supporting the product. A written agreement between the producer and the distributor is indispensable. There must be some avenue for checking up on the quality of service being provided. The aim should be for the distributor to furnish the same level of support or better than that which you offer. However, there should be some recourse if the distributor decides not to support the product. After all, support means more than just making the sale, it also means following through after the sale. Distributors do offer the distinct advantage of cutting down on the actual amount of financial commitment a vendor must make to develop a support staff — but careful selection of distributors is advised.

As for the consumer. Your consideration as a recipient of support is much less complicated, but no less important. Consideration for the customer often means support versus no support. You must realize that there are alternatives to support from the supplier. In many areas of the country freelance services are available for on site training. Local distributors will often perform some of the services. However, as with most things, there are trade-offs. For the most part, freelance services are not guaranteed. You get what you pay for, and you have no way of knowing what you'll really get beforehand. Then, too, the time honored users' group can benefit your staff greatly. Users' groups are handy, since they are located in your general area, but having employees attend sessions means time out of the office. And while you may consider this a worthwhile trade for production time, be aware that many users' groups are little more than company sanctioned gripe sessions. Your best alternative is the local distributor for the software. He has a direct responsibility to the supplier, and his own reputation, if he plans to stay in business. Again, you must decide if the trade-offs are worthwhile. The distributor's fees may be lower, and of course he is local, but he may also end his support by the supplier. In short, this means that you will receive little, if any, information about updates and new products from the supplier.

### Conclusions.

Software is a business that can take advantage of the low cost of the distribution media. It really costs very little to provide a magnetic tape with updated software. However, the expense to develop enhancements, provide adequate testing, and prepare for distribution is substantial. Once it's completed, the incremental costs of providing that to customers is small. As vendors, let's take advantage of it. We'll sell more products and make happier customers. We must communicate to the users the advantages of sharing the costs of maintenance and enhancements; they must see that paying annual maintenance support insures a future for the product they've already bought.

In the next issue we will discuss planning and preparing for the support of a software product.

A challenge from EEC SYSTEMS

# Put our software to the test...

DEC USERS

And learn how to tell the difference between run-of-the-mill software and software that is really special.

## EEC SYSTEMS SETS THE STANDARDS FOR QUALITY DEC\*COMPATIBLE SOFTWARE

**EEC SYSTEMS** has quickly become one of the leading software houses specializing in DEC compatible products, and for good reason. ALL of our software offers DEC users something really special at affordable prices, with excellent after sales support.

Let us help you become a discriminating DEC user. Read about some of our products below and call today for complete details.

## LEX-11 WP DP

**THE LEADER OF THE PACK.** A product so fast, flexible and powerful that our competitors "quake in their boots" when they see us coming.

**LEX-11™** is the only software product that can offer these advanced features, all in one software package: full screen editing, on-screen formatting, easy English language commands, one stroke key functions, true multiple column text entry, complete flexibility to change function keys, custom menus, spelling checker, desk diary, graphics, list processing, visual calculator fully integrated with editing, compatibility with DEC software... and much, much more.

**LEX-11** is available on the following operating systems: RT-11\*, TSX-PLUS\*, RSTS/E\*, RSX-11M\*, IAS\*, IDRIS\*\*, UNIX† (PDP-11\* and VAX\*), VMS\*

**NOW UNDER P/OS\***

**PHONE US FOR A DEMONSTRATION BY MODEM IN YOUR OFFICE TODAY**

\*LEX-11 is the registered trademark of ACE Systems.  
\*\*TSX is the registered trademark of S&H Systems Inc.  
\*\*IDRIS is the registered trademark of Whittemith Ltd.  
†UNIX is the registered trademark of Bell Labs.  
\*DEC, LEX-11, PDP-11, VAX, VMS, RT-11, RSX, RSTS/E, IAS, P/OS are the registered trademarks of Digital Equipment Corp.

## Catch23

**FOR THE 11/23 USERS. A NEW ADDITION TO THE FAMILY THAT HAS SET THE DEC WORLD BUZZING.**

Do you feel caught out, holding the bag with your 18 bit device controllers? Do you think you have to get rid of obsolete hardware before you can add up to 4 mbytes of memory with 22 bit addressing? **CATCH-23** provides a brilliant but inexpensive solution. With **CATCH-23** your 18 bit Q-bus controllers can function as 22 bit. **CATCH-23** can also convert Unibus machines to 22 bit systems.

Give **PLUS POWER** to your 11/23 today!

## Dache 11m

**GIVE YOUR RSX 11M SYSTEM RACING STRIPES.**

**DACHE 11M** is a memory disc block cache which increases system performance up to 70%. File access is visibly faster with the transparent action of the "in memory" block cache.

## WizDisc 11m

**PERFORMING MAGIC FOR RSX USERS**

**WIZ DISC 11M** is a software package allowing main system memory to be used as a solid state disc. Instantaneous access to files and overlaid programs located in the memory disc guarantees a dramatic increase in system performance.

## MultiDisc 11m

**CLEVER SOLUTIONS TO TROUBLING PROBLEMS FOR RSX USERS.**

**MULTI DISC 11M** can make multiple discs appear as if they were one contiguous area of file space. Disc seek time is reduced and bad disc blocks may be bypassed.

## Accounts 11m

**RELIEF FOR THE RSX SYSTEMS MANAGER**

**ACCOUNTS 11M** allows for the accurate recording of resource demands placed on a system and resource billing with individual report generation. Each account record, includes information on processor time, terminal session time, memory utilization and disc transfers. System managers can easily control costs as well as limit the use of system resources.

## ICE 11m

**MAKE YOUR RSX SYSTEM MORE USER FRIENDLY**

With our new interactive command line editor, you can edit command lines before or after their execution. Command lines can be recalled, edited and automatically re-issued.

## RJ-11COBOL

An enhanced **ANSI-74 COBOL COMPILER** and runtime system with supporting programs. It offers unbelievable speed, compactness and special features at a price that is truly remarkable. **TIME-SHARING COBOL** is now available. **RJ-11 COBOL** runs on RT-11, TSX-PLUS, and RSTS/E operating systems... RSX and VMS coming soon.

**EEC SYSTEMS INC.**

# MAPGRF

By Kelly Felkins, Police-Data Systems, Dublin, CA

The MAPGRF program examines a map created by the task builder and generates a graph of that task. The graph consists of one column for each segment of the task, with the starting position and length of each program section and module relative to the total addressing space. The graph is similar to

the drawings found in the Task Builder manual, but contains much more information.

You may wonder how this graph is useful considering that all of this information is already available in the map file. There are several reasons. First of all, it is hard to visualize the

structure of a task even though you may be familiar with task builder maps. Except for the section in the beginning that shows the overlay segments, the task builder map is simply data, not graphic. Also, the lines which describe sections and modules are not in order of increasing or decreasing addresses. The ODL file gives some idea of overlay structure, but references to libraries and other ODL files can cause confusion.

The graph can aid in overlay design. By displaying overlay segments in graph form, errors in ODL files are easily found. Deciding how to overlay, or finding modules to clean up in a task that exceeds memory is easier because the graph shows this information relative to the address space.

The MAPGRF program will run as is or can be compiled/TSK. To run the program, first make sure the map you want to graph is available. Then type:

**RUN MAPGRF**

The program responds with:  
Enter MAP file name?

Enter the name of the map file to graph. The default extension is MAP. The program continues with:

Enter memory increment?

This is the number of bytes to use for each line of the graph. The larger the number the smaller and less detailed the graph. A good number to start with is 256. The program continues with:

W[ide] or N[arrow] terminal  
< N > ?

Enter W for 132 column terminals or N for 80 column terminals.

At this point the program starts processing the map file. The name of each segment is printed as it is processed. When all segments have been processed, the program starts printing the graph. The graph is printed in sections that can be taped together for full effect.

This program works only on RSTS 7.2 but originally was developed on 7.1. For version 7.2, the taskbuilder map file format was changed from RMS sequential variable to RSTS terminal format files. Some other minor changes were made to the map file.

# TSX-NET™

## NETWORKING FACILITY

For LSIs & PDP-11s  
Running RT-11, TSX or TSX-Plus

- TSX-NET is used by OEMs, Labs, Universities and all types of businesses in over 350 locations in 14 countries around the world.
- TSX-NET is not just a file transfer utility —it provides full transparent access to peripherals on remote systems via user programs or standard system utilities.
- TSX-NET uses standard serial or multiplexor lines on LSI or PDP systems.
- TSX-NET permits an RT-11 or TSX-Plus system to transfer ASCII files to or from RSTS, RSX, VAX systems or non-DEC systems such as IBM supporting time-sharing lines.
- TSX-NET is very economical on system overhead to facilitate OEM/Service Bureau support of remote users.

Attention DEC™, PDP™/VAX™ Users:  
**Break Through  
Data Entry Barriers**

**with the  
Viking Forms Manager**

The Viking Forms Manager (VFM) gives you power to do interactive data entry quickly and accurately. VFM's on-line screen format generator creates forms which let you validate data as it is entered. You can check data immediately rather than wading through tedious batch reports tomorrow. Under VFM, correction is fast and precise; a real breakthrough for data entry.

If errors and poorly designed interactive forms have data entry running into a brick wall, call about VFM today . . . and prepare for the Viking conquest.

\$

# MACRO AND THE CLASSROOM

By Alan Hagerman  
4th Semester Student  
Williamsport Area Community College  
Williamsport PA

Amidst almost every computer science curriculum is at least one class on assembler. Future application programmers view it as a necessary lower life form. People who like to deal with the simpler things in life (1's and 0's) get upset at the application programmer's opinion. At the Williamsport Area Community College we are offering MACRO-11 for the first time. I thought I might share some of the enlightening experience we enjoyed on . . . The Road to MACROMANIA.

One of the first decisions to be made was under which Run Time System we wanted to execute our MACRO. RSTS/E supports MACRO under both RT-11 and RSX. Both offer the same instruction set but each offers a different set of directives. RT-11 directives are aimed at I-O and monitor interaction through manipulating the FIRQB and the XRB. RSX directives are aimed at more powerful programming (library usage, AST control, etc.).

After very careful consideration of all factors involved and a lengthy deliberation, we chose to execute under RSX for one main reason. In our mostly futile attempt to do I-O to our CRT's, we located copies of two articles written by Bob "Macro man" Meyer on RSTS I-O which happened to use RSX. Much to our mental relief and Mr. Meyer's credibility, these routines worked!! (see the RSTS Professional, May 1980). These routines also indirectly solved another problem we had. How will our students be able to debug their MACRO programs? Because of time limitations and our inexperience we ruled out ODT. Our inexperience also ruled out attempting a dump MACRO. However, since we are under RSX, we have to use the task builder. So, after consulting the task builder manual, we decided to include the /PM switch. This will give our students a 'post-mortem dump'. (Gee, that sounds fatal!) For all of those who are interested, a post-mortem dump is an 'almost' snapshot of the user job area at the time that the program terminates abnormally. This dump is placed in an unformatted binary file called PMDxxx.PMD where xxx is the

current job number. To view the contents of the .PMD file you must run a system program called PMDUMP. (See your RSTS Systems User's Guide for more information.) This formats the file and will generate another file of the same name but with a '.LST' extension. The '.LST' file contains your user job area in octal, your LUN table information, the stack, and all of the registers. This listing will give the student at least some of the information he needs to debug the program.

The content of a new course and the

direction of the material depends mostly on the students' background. At W.A.C.C., most of our students have assembler in their second semester and thus only have one semester of high level language. They normally get their exposure to basic operating system principles in their third semester. Therefore at the time they take the course, the students have very little concept of the computer environment. (No virginia, it's not magic!!) This places our course in the precarious position of present-

. . . continued on page 132

# ADVANCED EDT - Part 3

By Jeffrey Gold, CITIBANK, NA, New York, NY

I found David Spencer's article "EDT Extended With An Initializer File" (DEC Professional, Vol. 1, No. 3 and Vol. 2, No. 1) both well written and informative. There is however, some additional information which I believe your readers would find valuable.

## 1.0 LOGICAL NAMES

EDT uses two logical names to locate the initializer file (EDTINI) and the help file (EDTHELP). The current defaults are:

```
EDTINI = SYS$DISK:EDTINI.EDT
EDTHELP = SYS$HELP:EDTHELP.HLB
```

You may redefine these using the DCL ASSIGN command. The advantages of doing this include:

1. You can place the files in any directory and call them anything you wish (i.e., ASSIGN SYS\$MANAGER:SYSEDTINI.ALT EDTINI).
2. You do not need a separate copy of the initializer file in each sub-directory.
3. A group of people can access the same file by placing the ASSIGN statement in their LOGIN.COM files. The logical names may be defined group-wide or system-wide, too. This simplifies files management, as only a single copy of the file must be updated to effect a change.
4. You may have multiple initializer files, used for different purposes. The "active" copy may be changed by re-defining its logical name.

## 2.0 MODIFYING KEYPAD MODE HELP

Modifying the EDT help file was discussed in Part 2 of David Spencer's article, "How the EDTHELP.HLP file is organized."

### 2.1 The LIBRARIAN

EDT help text is kept in a help library, organized in modules. To modify the help text you must extract the correct module as a text file, modify the module using an editor (EDT of course!), and replace the module in the help library. Example:

```
$ Libr /EXT=KEYPAD /OUT=KEYPAD SYS$HELP:=EDTHELP.HLB
$ EDIT KEYPAD.HLP
$ LIBR /REPLACE SYS$HELP:EDTHELP.HLB KEYPAD.HLP
```

### 2.2 KEYPAD NUMBERING

Each key on the keypad and the keyboard is assigned a number. When adding or modifying text for a key, you must specify its number. The EDT Editor Manual displays the numbering scheme of the keypad only in Chapter 10: Redefining Keys. The complete numbering scheme is as follows:

RANGE	DESCRIPTION
00 - 21	keypad
22 - 43	GOLD keypad
74	CTRL < Null A-Z [ ] ' / >
70	GOLD < ASCII character set >

Example:

CNTLA/A is recognized by EDT as key 45, CNTL/B as key 46, GOLD-CTRL/A as key 76, and GOLD-A as key 136.

The keypad number is always used when searching through the EDT keypad help file. If you are in keypad help mode and hit CTRL/A, EDT will internally generate a search for the text "KEYPAD VT100 45." EDT V3.0 does have some limitations:

1. EDT will not translate certain characters in the 75-200 range into their key code equivalents. This includes: numbers (0-9) and lower case (a-z) characters.
2. Some control characters are passed to the terminal driver without translation: (CTRL-C CTRL-O CTRL-Q CTRL-S CTRL-Y ESCAPE).

## 2.3 ADDING OR MODIFYING KEYS

You must always specify the two digit key code, "CTRL A" cannot be used in place of "45" as in the DEFINE KEY command. Keypad help mode will not search for any key value above 74. Therefore, to document any GOLD-ASCII keys you must place them in a separate help library module. You might also document "GOLD-char" with the corresponding "CNTL-char".

## 3.0 PRESET KEYPAD DEFINITIONS

As a training aid I am including the preset key definitions. These may be examined using the SHOW KEY command.

### 3.1 EDT V3.0 DEFAULT VT100 KEYPAD

CODE	KEY	DEFINITION
	DEL key	D-C.
52	BACKSPACE	^H.
53	TAB key	^I.
54	LINE FEED	^J.
57	Return	^M.
00	0	L.
01	1	W.

# NOBODY DELIVERS DEC CONTROLLERS LIKE PLESSEY.

Because nobody has the range of DEC-compatible controllers and mass storage subsystems that Plessey has.

Controllers, floppies, cartridges, disc packs, Winchesters and magnetic tape, including a proven 1/4" streamer. All the storage you need for your LSI-11, PDP-11 or VAX computers. (Complete subsystems with savings of up to 50%, too).

Just check the chart, then check us out at (800) 992-8744.

We can also help your budgets and your systems with communications multiplexers. And with a huge selection of memories, typically 30% less expensive than the DEC equivalents. 32 kbytes to 1 Mbyte. ECC, parity and non-parity. MOS and non-volatile core. They're fully DEC-compatible, but run up to 30% faster, occupy less space and come with an extensive 1-year warranty.

And we'll back you up with our own worldwide network of factory-trained specialists. They can service products from a variety of vendors and answer all your questions about configuration, operation or software. You get the responsiveness of an in-house technician at a

fraction of the cost.

Nobody else even comes close.

For the rest of the story, contact: Plessey Peripheral Systems, Computer Products Division, 1674 McGaw Avenue, Irvine, CA 92714. Telephone (800) 992-8744 or (714) 540-9945.

# INTERFACING ENCODERS TO THE Q-BUS?

The Kern KSIO-11 board provides the following:

- Interfaces 4 quadrature-type encoders to the Q-bus
- 24 bit up/down counter for each encoder
- Supplies power to TTL rotary encoders from the Q-bus
- Additional 16 input and 16 output lines
- Interrupts on 2 of the input lines

# DEC\* COMPATIBILITY PLUS

## PERFORMANCE

## DEPENDABILITY

## ECONOMY

Monolithic Systems Corporation has provided reliable DEC compatible memory products for over 12 years. In fact, MSC patented the first semiconductor memory product in 1974! The success of Monolithic Systems has been attributed to products that perform better than any other in the business, products that have the modularity to grow with the systems that they're installed in and products that offer the best price in the market. These claims are supported by a one-year warranty which underscores MSC's superior quality in design and manufacturing.

In 1983 MSC will continue to lead the market with products for Q-BUS\* and VAX\* machines. These products will be very formidable contenders for years to come. As always, Monolithic Systems will be on the leading edge of memory technology and innovation with products to last the life of your machine.

For further information on Monolithic Systems Corporation and how we may support your computer needs, call Toll Free 1-800-525-7661.

Only one accounting,  
manufacturing software  
company speaks the  
language of VAX...

### INTERACTIVE MANAGEMENT SYSTEMS

IMS has been developing business application software for the VAX family of computers since its introduction by Digital Equipment Corporation. As a result, we know from long experience what *you*, the VAX-user, need in order to get your accounting and manufacturing functions on-line.

Our truly native mode software is written entirely in VAX-11 Basic, utilizing VAX-11RMS. And that makes it compatible with DEC's Datatrieve query language. You'll also find IMS Software easy to integrate, exceptionally versatile. For more information, see our new IMS Software Portfolio, featuring the most extensive line of Business Applications Software for VAX and RSTS/E. Clip and mail the coupon below . . . or call us today at (617) 489-3550.

## Macro and the Classroom

. . . continued from page 127

ting easy-to-use routines which can establish basic assembler language concepts.

Since we now knew which RTS we were going to use, we attempted to develop initial program standards and procedures. Because of the overhead involved with the task builder, we use a BASIC-PLUS program which accepts the filename of the program and then builds and queues a control file for the batch processor. The control file calls the task builder and uses the /PM switch. After completion, a message notifying the user of its completion is printed on the system console. By doing this, we reduce the number of concurrent task builds and thus soften the blow to RSTS from the added task building. Each MACRO task build takes but a few minutes (in theory) so there should be very little inconvenience to our students. We use this same procedure for our RPG and COBOL and it works well, but with MACRO there is one small flaw. The MAC.TSK compiler does not detect any undefined symbols, but the task builder does. This would be no problem if the task building was being done by each student at his/her terminal because the error message would show on their screens. Since we are using the batch processor however, the error message will only show up in the .LOG file. This makes it necessary to keep this file. (We normally have a PIP to delete all unnecessary files contained in the control file.) We also have to train the students to look at the .LOG file for any task builder error messages.

The major hindrance to the initial course development was our lack of any experience. Only through contact with our friendly software reps and other colleges did we manage to get started. Armed with the routines by Mr. Meyer, the system manuals, and lots of aspirin, we were able to write and execute simple programs which communicated with the outside 'world'. However, we soon realized that these routines would not suffice in the actual class. To attempt explaining to our students something we barely understood (how to use the low job area) would only have placed fantasies of compilers in their heads. This decision then caused another problem to surface. Where should we place the MACROS we create? The first choice would be a library, but nobody here has ever built one. So the easiest place we could think of was our own prefix file, similar to COMMON.MAC.

#### 4.0 CHANGES TO VOL.3

For those of you already using David Spencer's "Standard Initialization File Vol.3," I would like to suggest some minor modifications.

- EDT V3.0 does not allow you to redefine CTRL/X or GOLD-CTRL/X using the "DEFINE KEY" command, although it is allowed using the CNTL/K (DEFK) keypad function. I have renamed these functions as CTRL/V and GOLD-CTRL/V.
- DEF K 10 AS "'?Press GOLD-HELP for help. Press ENTER to continue.'" This is done for first time users looking for help.

#### 5.0 OTHER INITIALIZATION FILES

Almost everyone has his "favorite" initialization file. I am including three that were originally prepared by John Sauter of DEC and printed in the VAX LANGUAGES HAND-OUT from the 1981 Fall DECUS Symposium.

#### 5.1 RATIONAL.EDT - DEFINE VT100/VT52 RATIONAL KEYPAD

```

# BENCHMARKING DEC AND DEC-COMPATIBLE HARDWARE SYSTEMS UNDER RSTS/E WITH YOUR APPLICATIONS

By J. Peter Bryce, System Support Team Inc., Vancouver, B.C. Canada

## INTRODUCTION:

Any company considering a major hardware upgrade of CPU or disk capacity normally wants to have a good idea of just what the benefits of the proposed system are. Software houses are more interested in providing potential clients with performance per dollar figures for their specific applications on different CPU configurations. The following method was suggested by Kirk Bryde of Canadian Data and was refined by both of us while assisting EBS Data Processing, Inc. of Denver, Colorado to determine whether DEC or OEM CPU's (by such companies as ABLE and Monolithic) were better value in performance per dollar using the EBS ED-1100A Inventory Control package in a typical situation.

We performed these tests under the RSTS/E operating system, but with some minor adjustments for different performance gathering techniques and personal preference, the basic concept should work for any operating system (on pretty well any CPU). A complete understanding of system tuning techniques is assumed for purposes of brevity.

## PLANNING:

The first item to be decided upon is what configurations you would like to test, for example:

LOADTEST	CONFIGURATION	DURATION	MAX. TERMINALS
1	DEC 11/23, 3/4 mb, 1200 bd	20 min.	8 DZ
2	DEC 11/23, 3/4 mb, 2400 bd	20 min.	8 DZ
3	DEC 11/23, 1 mb, *	20 min.	8 DZ
4	DEC 11/44, 1 mb, *	40 min.	16 DZ
5	DEC 11/44, 1 mb, *	40 min.	16 DH
6	DEC 11/44, 3/4 mb, *	40 min.	16 *

\*Indicates an item to be decided on the basis of earlier tests.

Looking at the list one can easily see two things, first that there are many, many permutations for comparison, and secondly that a lot of people are going to be needed to assist. Having drawn up your list, the next step is to ensure that the hardware for each test is available or will be available on the required date, which will take some advance coordination.

Sales personnel and/or user training personnel should then meet to work out the application loads for the tests. Establish the sequence of users to reflect the normal application process when planning the incremental load on the system.

As you can see, at the start of the test two statistic collection terminals begin at minute zero. Keyboard 0 uses the

## TERMINAL USAGE PLAN

MINUTE	KEYBOARD #	NAME	APPLICATION
0	0	Peter	SYSTAT
	12	John	STATUS collection
2	13	Harry	Order Entry response test
4	14	Fred	Stock Status response test
6	15	Mike	Order Entry
8	16	Carl	Accounts Receivable data entry
10	17	Chris	Keyboard Exerciser (simulated print job)
12	18	Dave	Order Entry
14	19	Simon	Accounts Payable data entry
16	—		(No new terminals to permit loading to show on graph.)
18	—		
20	—		

SYSTAT/S command to provide figures for CPU calculations every two minutes on the two minutes. Keyboard 12 is started at the same time; i.e., the last carriage return is hit to cause execution of the STATUS program at thirty second intervals, printing the results on the keyboard (a hard copy device) simulating an intermittent print job of short duration.

At minute 2, having had two minutes of statistics gathering to establish a comparative base line, the first response time test, an Order Entry screen will begin. The operator at this terminal will have an assistant operate a stopwatch and will perform the test as often as possible depending on system response. The results can then be recorded like this:

## RESPONSE TEST

MINUTE	STOCK STATUS	ORDER ENTRY
2	3.5	—
	3.6	—
	3.4	—
4	3.8	6.8
	4.0	5.9
	4.2	6.4

## WHY YOU SHOULD CALL UNITRONIX FIRST

- Immediate Delivery from \$6 mm Warehouse Inventory
- Complete Equipment Service Capability
- Excellent Pricing/Discount Structures

In just over 6 years, Unitronix Corporation has emerged as a leading supplier of Digital Equipment Corporation (DEC) microcomputers, terminal products, printers, ac-

cessories and supplies on both a domestic and international level. Our new, ultra-modern 20,000 sq. ft. facility in Somerville, New Jersey, houses executive offices, in-house programming, customer service, sales and marketing, component testing and complete warehouse facilities.

**(201) 231-9400**

The other terminals then start at two minute intervals, maintaining the typical job mix of a real-life system. When all terminals have been added, statistics will be collected for several minutes to allow the graphs to show clearly the results of what should be a full load situation.

It's important that both senior management and all staff who are going to be concerned with the tests understand that unless the human factor of error is reduced, the graphs produc-

ed will be useless. This means that effectively, people must be programmed to perform exactly the same task at the same time on each test for comparisons to be made. Inevitably there will be occasions when someone will miss his cue or some unsuspected glitch will show up and cause a test to be restarted, but enthusiasm and encouragement will make up for these slips.

Now that the general plan has been established, the persons who are going to operate the terminals meet

with the application analysts and sales staff to develop a typical set of data files which could even be a copy of live data if time is short. Each person must then be given the part numbers, customer numbers or other information necessary to perform the repetitive function needed. Inattention to this simple item can cause embarrassing interlock problems on master files at random intervals which will throw the results askew. Ensure that the analysts understand the sequence of events and can guarantee consistent results; i.e., after entering five orders will an automatic job be spawned to perform inventory update?

Of course the database must be restored before each loadtest can begin, to take care of accumulated overheads from bucket-splitting etc., and remember that temporary files should also be deleted to avoid directory search increases.

#### THE LOADTEST:

Preparing for a test will take up to half an hour, so the participants should not arrive until all is ready. Check each terminal number by logging on, check the speed, keyboard number, and computer, then put each terminal to the main menu so that at the correct cue the user merely selects a menu option rather than going through LOGIN. Naturally all terminals should be within earshot if not eyesight of each other. A large clock with a seconds sweep hand should be used to set computer time to wall time; i.e., when the second hand is at twelve, hit RETURN on a UT TIME command which can only set hours and minutes.

As the terminal users arrive the coordinator should show them to their keyboard as shown on the Terminal Usage Plan. He or she should be positioned close to the clock, preferably where all participants can both see and hear him/her (such as standing on a desk).

It's a good idea to remind everyone of what the test is for, then to roll-call each person with his cue minute. Give a two minute warning after ensuring that all telephone interruptions will be minimized.

Times should be called out as "ten seconds to minute zero, five seconds, and mark!". To provide warnings, also give each user a thirty second warning — you'd be surprised

The smoothest path between RSTS/E and VAX/VMS just got smoother: there's a major new release of

## ROSS/V

#### ROSS/V has always provided:

- the fastest way to bring up RSTS/E applications on the VAX.
- the only way to do RSTS/E development on the VAX.
- an extensive subset of RSTS/E monitor calls and standard RSTS/E features, like CCLs, DOS-formatted magtape, and RSTS/E-style file update mode.

#### Now, in Version 3, ROSS/V supports:

- the "hidden" RSX run-time system (with 32 KW job size).
- resident libraries.
- job spawning and detached jobs.
- spooling to VMS print and batch queues.
- mailbox send/receive for communication with VAX-11 BASIC and other native mode applications.

#### How ROSS/V works:

ROSS/V is written in VAX-11 MACRO, and RSTS/E monitor calls are performed in VAX native mode. The rest of your PDP-11 code (in applications, run-time systems, TKB, etc.) is executed directly in the PDP-11 microcode that's present in every VAX. ROSS/V runs under VMS, not in place of it. Thus, some users may be working under the RSTS/E subsystem provided by ROSS/V while others are concurrently using any of the other VAX/VMS capabilities.

Call or write for the new ROSS/V technical summary, which describes all of ROSS/V's features.

## ROSS/V

... continued on page 139

```

TITLE FWBSI Version 4.0
Function: This program rewrites the "Factory Written Bad Sector
Information" on RL01/2 or RK06/7 disk drives.
Parameters: The program is used like any other RT-11 utility as follows:

.R FWBSI
*DEV:/H:abode/L:fgjk/Y
where
DEV: is the name of the RL01/2 or RK06/7 drive containing
the affected disk
/H is a switch identifying the five high-order octal
digits in the disk serial number; 'abode' specifies
those digits
/L is a switch identifying the five low-order octal digits
in the disk serial number; 'fgjk' specifies those
digits
/Y is an optional switch to suppress the prompting message
that asks if the user is sure

The handler for DEV must be resident on the system disk. This
program is assumed to be running under an RT-11 single job
monitor.

To assemble (with listing):
.R MACRO
*FWBSI,FWBSI;N:BEK;N:SYM;E:LC:FWBSI

To link (no map necessary):

# Tune up your LA36

## The DS120 Terminal Controller makes your LA36 perform like a DECwriter® III.

The Datasouth DS120 gives your DECwriter® II the high speed printing and versatile performance features of the DECwriter® III at only a fraction of the cost. The DS120 is a plug compatible replacement for your LA36 logic board which can be installed in minutes. Standard features include:

- 165 cps bidirectional printing
- Horizontal & Vertical Tabs
- Page Length Selection
- 110-4800 baud operation
- 1000 character print buffer
- X-on, X-off protocol
- Self Test
- RS232 interface
- 20 mA Current Loop interface
- Top of Form
- Adjustable Margins
- Double wide characters
- Parity selection
- Optional APL character set

Over 5,000 DS120 units are now being used by customers ranging from the Fortune 500 to personal computing enthusiasts. In numerous installations, entire networks of terminals have been upgraded to take advantage of today's higher speed data communications services. LSI microprocessor electronics and strict quality control ensure dependable performance for years to come. When service is required, we will respond promptly and effectively. Best of all, we can deliver immediately through our nationwide network of distributors. Just give us a call for all the details.

## BENCHMARKING . . . continued from page 136

how many times a pressing need has caused someone to visit a restroom at the wrong time!

During the warm-up or even while the test is running, remind personnel that it's better to restart a test than to have inaccurate figures to base expensive decisions on. Mention that no blame will be attached to operator finger trouble (O.F.T.) promptly admitted to. Somebody mis-typing an account number may cause several additional screens to occur and unless owned up to problems such as this will be apparent as soon as the graphs are compared but may be almost impossible to pin down beyond the "something funny happened" stage.

Depending upon your plan it may be possible to run two or three loadtests consecutively without too long a delay for assisting personnel. A baud rate change on eight terminals can take two people ten minutes after practice; yes, it should be quicker, but the first time it took almost thirty minutes!

Allow sufficient time at the end of testing for the test data to be restored (don't forget that for good results, a restore must be done for any restart after minute two), terminal speeds to be set to normal, etc.. As a rule of thumb allow thirty minutes before and after testing with assisting staff required ten minutes before the start.

### CORRELATING THE RESULTS:

At the end of each test, before anybody leaves the area, the coordinator should collect listings of SYSTAT, STATUS and response times, labelling them clearly, ensuring that any handwriting glitches are corrected while the data is fresh, and doing a quick check to see if there are any obvious incongruities that might cause a re-test.

If fast discussions are needed for the next test, such as whether a baud rate change is going to improve results, announce a coffee break for ten minutes and retire to a quiet place with the figures.

Preparing the results in management-presentable form will take up to four hours per test. Begin by transferring data to a form like this one:

LOADTEST 1 — DEC 11/23, ¾ MB, 1200 BD FEB 12/83 15:45

TOTAL MINUTE	KEYBOARD	CPU MIN. %	CPU Kb %	DISK I/O ACC/SEC %	TERM I/O CHARS %	STOCK RESP	ORDER RESP
0	1						
2	2						
4	3						
6	4						
8	5						
10	6						
12	7						
14	8						
16	8						
18	8						
20	8						

Management will almost always find the graph easier to work with, but for the best presentation this chart provides all graphic points as actual figures. The detailed technical discussion will start at the graph and work its way back to the statistics listing and SYSTAT listings which should be retained in binders for each test with the response time results in detail.

## INTERACTIVE DATA ANALYSIS for VAX and PDP-11's

### ADVANCED CAPABILITY

- USED BY:**
- 1/3 of Fortune's Top 50
  - Almost every major US university
  - 100's of smaller organizations in 25 countries around the world

### ELEMENTARY OPERATION

#### SIMPLICITY OF DESIGN

- RESULTS IN:**
- Rapid installation and operation
  - Sophisticated range of data analysis and statistical capabilities

To fill in the loadtest form take a calculator, or program and enter the figures as follows:

- CPU minutes — Take the SYSTAT CPU times, accumulate them and subtract the previous two minute total. This gives the total CPU minutes and can then be expressed as a percentage of two minutes.
- CPU Kb — Take the SYSTAT listing, calculate fixed memory overhead; i.e., monitor size, XBUF, core resident libraries, etc.. Add to that the memory used by each user job, ignoring swapped out system jobs such as ERRCPY, etc.. Express the total as a percentage of total available physical memory.
- Disk I/O — Take the STATUS listing for each two minute period i.e., where the banner printed is within that period, accumulate total disk reads and writes on all drives for that period, then express as a percentage of the average number of accesses per second (one second divided by average accesses per second multiplied by the number of drives used).
- Terminal I/O — Take the STATUS listing for each two minute period and accumulate total characters per second I/O, then express as a percentage of the accumulated baud rates for all terminals divided by ten to arrive at a graphic representation of DH or DZ load.
- Stock Response — Take the Response Test results, accumulate the results that were completed in each two minute period and average them out.
- Order Reponse — As above.

The graph can now be filled in using either colour or some other technique to highlight the six different sets of results:

Modify the calculations and graduations to provide the most visible spread for each line.

**COMMENTS AND SUGGESTIONS:**

Running loadtests is addictive. Bearing in mind the effort involved in each one, try to restrict yourself to the smallest number necessary. It's possible to spend weeks fine tuning a system to gain absolutely insignificant results on response times; after all, who cares if the computer is working 5% harder if the response time is the same, especially when reducing that 5% has taken eighty to a hundred man hours?

Before running a loadtest both your application and operating systems should be as tuned as they can be. A loadtest is no time to be testing the effects of a larger XBUF on response time; it's intended to highlight hardware characteristics only. The objective is to be able to report that System A has an acceptable response time with eight terminals, while System B was fully loaded at five. This kind of plain and simple result is something that everyone can understand, even manufacturers.

The subject of the most efficient terminal speed is one of endless discussion; the best advice I can give is to loadtest on a baud rate binary split. The results will be quite interesting.

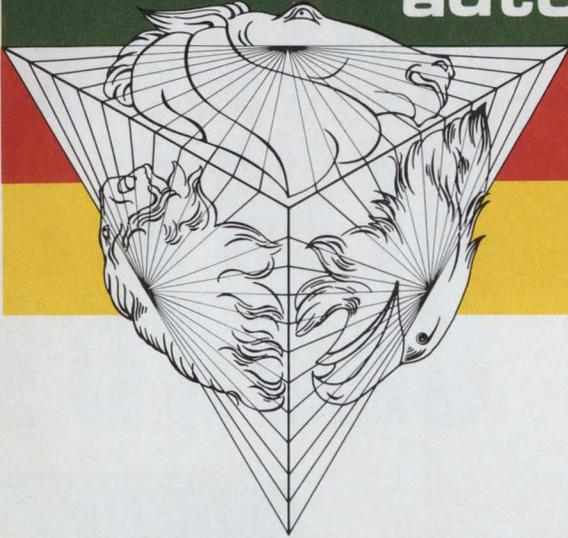

The calculations are based on my experiences of what should cause a good visual result on the graph, and I'd be the first to admit that there are probably more effective ways of calculating disk load however the main result needed is the response time stretch as terminals are added. The other results are intended to provide pointers towards problem areas which can be closely investigated by technical personnel working directly with STATUS and other tools. The objective is to come up with something to show non-technical personnel such as senior management without getting too technical.

For those of you interested in the comparison of DEC, ABLE and Monolithic CPU's I can only say that if sufficient interest is generated I shall endeavour to obtain the appropriate permissions before printing the results.

# Need cost-saving process automation solutions?

## KineticSystems simplifies process automation . . .

with our total system concept utilizing the international CAMAC interface standard (ANSI/IEEE-583, IEC-640).

The **LION**, the **HAWK**, and the **STALLION**, a series of powerful new DIGITAL-based systems, fulfill your process control needs, whatever your industry, whatever your application.

These benefits reduce your operating costs:

- **Flexible Interfacing.** Complete line of standard IEEE CAMAC I/O modules are available for your application.
- **Maximum Process Uptime.** Proven system design and diagnostic indicators make your system reliable and easy to maintain.
- **Rapid Investment Payback.** Full payback is often obtained within six months to a year.
- **Long System Life.** Systems based on the CAMAC standard have been in operation for more than a decade.
- **Economical System Expansion.** CAMAC modularity permits limitless expansion at minimal cost.
- **Total System Support.** Software and hardware services are available to meet your specific needs.

### **LION** T.M.

A comprehensive, multiuser, multitasking system incorporating LSI-11/23 CPU, 30-megabyte Winchester, 256-kilobyte memory and RSX-11M® operating system.

### **HAWK** T.M.

A cost-effective, single user system containing LSI-11 CPU, 1-megabyte floppy disk drive, 64-kilobyte memory and RT-11® operating system.

### **STALLION** T.M.

A powerful, multiuser, multitasking system including VAX-11® CPU, mass storage, memory, and VAX/VMS® operating system.

# Raise your "Programmer Productivity" to new heights

If you're writing Fortran programs and need solutions to mathematical or statistical problems, use the IMSL Library to shorten your programming time and increase the time available for problem-solving.

The IMSL Library consists of 540 highly accurate mathematical and statistical sub-routines. Programmers supply only the basic Fortran input/output statements. The Library does the numerical work.

## WIDE RANGE

The IMSL Library, with over 150,000 users, operates on all major computer systems. The Fortran subroutines cover the broad range of applied mathematics and statistics including areas such as Linear and Non-linear Equations, Eigensystem Analysis, Interpolation, Differential Equations, Optimization, Analysis of Variance, Regression, Forecasting, Multivariate Statistics, Random Number Generation and special functions.

## LOW COST

Priced at less than 2¢ per line, the IMSL Library frees current people from expensive, time-consuming programming. Increased productivity results without adding personnel.

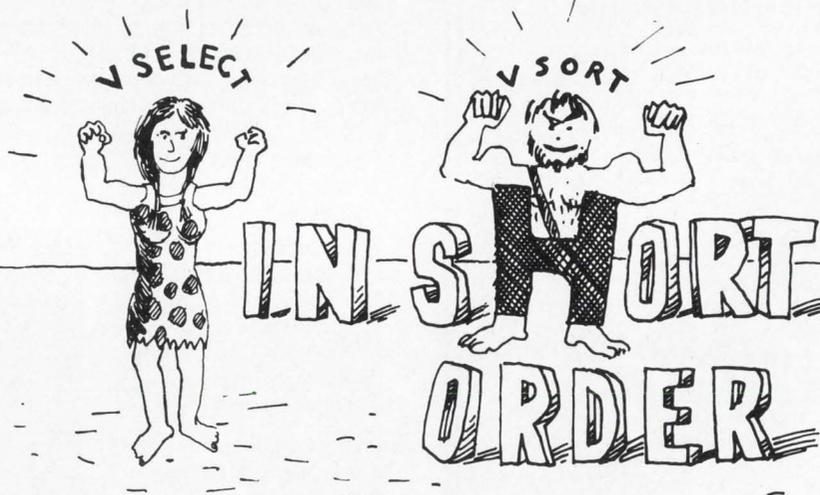

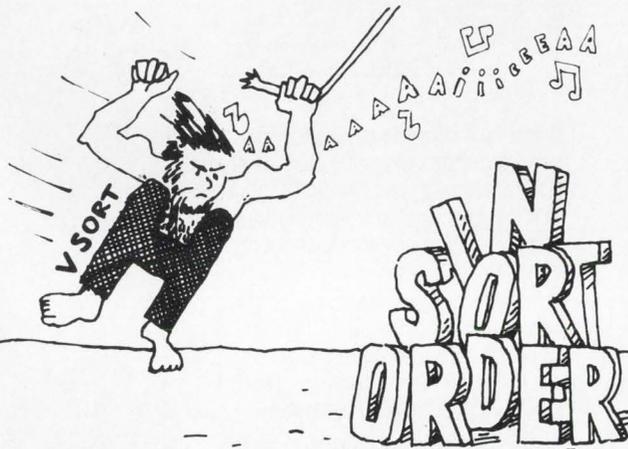

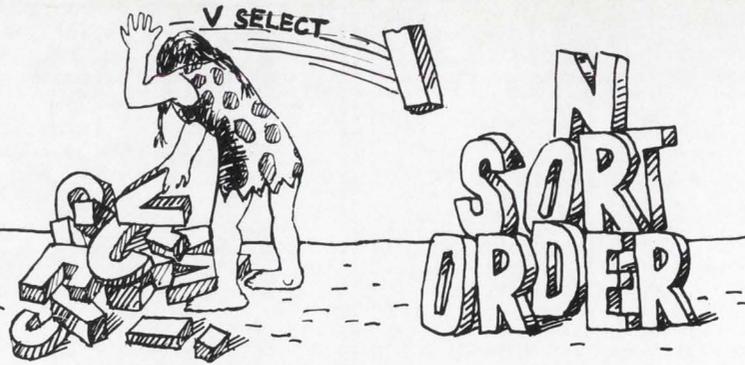

Contact IMSL for full details. Call toll free—  
Outside Texas:  
800/231-9842.

## VSORT and VSELECT for VAX/VMS

**Evans Griffiths & Hart, Inc.**  
 55 Waltham Street, Lexington, MA 02173  
 (617) 861-0670 TWX 710-326-0103

VSORT runs 3 to 7 times faster than the VAX-11 sort . . . and requires much less disk space.

VSELECT extracts and reformats records with comparable speed.

Find out how these packages can significantly improve the efficiency of your applications.

**Call or write for information.**

## DEXPO INFO

### NEW IDRIS IMPLEMENTATIONS FROM WHITESMITHS

Concord, MA — Whitesmiths, Ltd. has introduced three new implementations of Idris, its UNIX-compatible operating system, for DEC personal computers, DEC VAX computers, and the Motorola 68000 microprocessor with memory management software. The price for each version is only \$550.

The company also announced that it endorses the additional system calls and library functions needed to conform to the standard for UNIX and UNIX-like operating systems recently proposed by UniForum, the commercial UNIX users' group. Now, not only is Idris one of the most transportable of operating systems, but it also enjoys the same level of source code interchangeability as the rest of the UNIX community.

Modeled closely after Bell Laboratories' UNIX operating system, Idris is a comprehensive, multi-user, multi-tasking operating system that provides a uniform environment across a broad spectrum of mainframe, mini-, and micro-computers.

Its smaller size and greater configurability make it more suitable

than UNIX for desktop and dedicated real-time applications. It offers the ability to write truly portable applications, cross-support for a variety of machines, and a sophisticated set of software tools that include over 80 utilities.

A console device and at least one disk drive are typically required to support Idris. Other disks, multiplexors, and backup devices may be added to tailor Idris to a given hardware configuration.

All implementations of Idris are now sold under Whitesmiths new "licensing under copyright" concept. Using this approach, each software package is sold with a numbered and coded Authorization Seal that must be affixed to the computer authorized to run the software. No end-user license is required, thus lowering costs for OEMs and simplifying transfer of the ownership of the software.

The price of Idris with a C compiler and all utilities is \$1100; without a compiler the price is \$550. A "minimal" Idris host for turnkey operation is only \$300. Substantial OEM discounts are available.

Whitesmiths, Ltd. develops and markets a wide range of computer systems software, including compilers, software tools, and its own portable operating system, Idris. Whitesmiths' products have earned a reputation for being reliable, portable, efficient, and cost effective. For more information contact Whitesmiths, Ltd., 97 Lowell Road, Concord, MA 01742. Tel. (617) 369-8499.

### ROSS TO SHOW MAPS/PRO, NEW SOFTWARE FOR THE DEC PROFESSIONAL 350

Palo Alto, CA — Ross Systems will demonstrate MAPS/Pro, the new financial software for the DEC Professional 350, at DEXPO East '83 held at Henry W. Kiel Auditorium in St. Louis, May 22-24, 1983.

MAPS is Ross Systems' financial modeling package designed for an array of applications for the financial executives. Financial forecasting, budgeting, strategic business planning, personnel planning, tax analysis, and consolidations are just a few of the areas in which MAPS has been repeatedly successful. A full color graphics package is included with MAPS creating a perfect tool for faster, more accurate financial decision making. Used on Digital Equipments' PDP-11 and VAX-11 computers, MAPS is a language for decision support of non-programing executives.

The version of MAPS for the new DEC Professional 350, called MAPS/Pro, contains all of the commands and capabilities of MAPS. MAPS/Pro also shares features and benefits of its forebear such as Interactive "friendliness," flexible reporting, integrated graphics, prompts, HELP messages, and a library of financial functions.

INTAC is Ross Systems' database management system, and is a powerful tool for organizing and reporting strategic data. Data entry, data

validation, updating, reporting and inquiry are all available in easy-to-use Business English. INTAC applications include financial information databases, headcount planning, accounting systems, asset/liability management, and much more. Contact Ross Systems, (415) 856-1100 for further information.

**MICOM INTRODUCES  
CONCENTRATOR SWITCH**

Chatsworth, CA — For data communications networks that need an inexpensive way to implement data switching and port contention functions, Micom Systems is introducing a new kind of intelligent networking product called the Micro860 Concentrator Switch. The new device connects up to eight Micro800/2 Data Concentrators, and operates as the logical hub of a network to allow any asynchronous channel on one concentrator to communicate with any other channel on that or

any other concentrator — all under centralized control. (A Command Port and a Log Port are provided for network management functions.)

In effect, the Micro860 provides a number of add-on networking functions — add-on switching, channel contention, queueing, and centralized management — to what otherwise would be only a collection of point-to-point links. With the Concentrator Switch, users can increase the flexibility and expand the functions of their networks while actually reducing telephone line and communications hardware requirements.

Micro860 Concentrator Switches are available to support four or eight Micro800/2 Data Concentrators. The four-composite model is priced at \$2,550, and the eight-composite version is \$3,250. Deliveries are scheduled for 90 days after receipt of order. Contact Mark Vonarx, National Sales Manager, Micom Systems, Inc., (213) 998-8844 ext. 479.

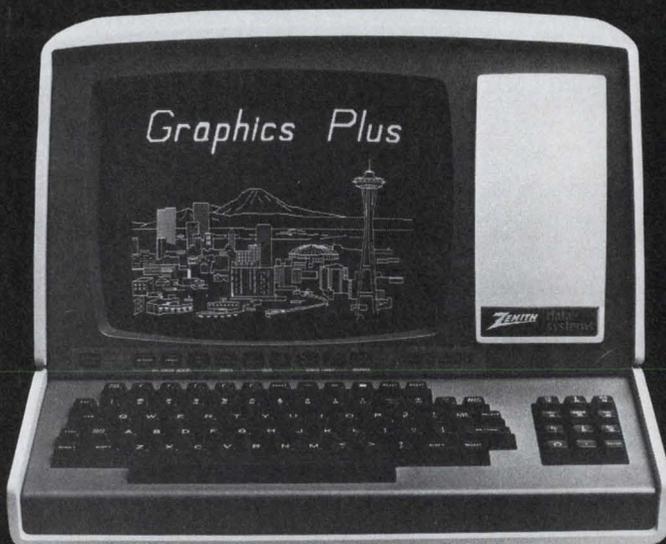

**ANDROMEDA CUTS PRICE  
OF WINCHESTER**

Canoga Park, CA — Because of volume based manufacturing efficiencies, LSI-11 systems house Andromeda Systems, Inc. has announced new price cuts, averaging 10% in many of their Winchester disk based products.

In addition, the WDC11 Winchester/floppy emulating controller is now available in a Winchester only configuration. The WDC11-xW may be specified to emulate DEC RK05, RL01/2 or RP02 disks. Single quantity price is \$1750 with delivery stock to 30 days ARO. For further information contact Andromeda Systems, Inc., 9000 Eton Avenue, Canoga Park, CA 91304, (213) 709-7600, or see us at DEXPO Booth 320.

**SAS INSTITUTE TO DISPLAY  
TEST VERSION UNDER VMS**

Cary, NC — SAS Institute Inc. will display the Beta test version of the

GRAPHICS-PLUS is a field installable enhancement board for the popular Zenith<sup>1</sup> Z19 video terminal adding many powerful features found only on terminals costing much more. GRAPHICS-PLUS provides Tektronix<sup>2</sup> 4010 compatible vector drawing graphics, VT100<sup>3</sup> compatible 80 and 132 column display formats, off-screen scrolling memory, programmable function keys, "Plain English" menu-driven Set-up mode, and a host of other enhancements. Installation can be accomplished within 15 minutes using only a screwdriver.

**GRAPHICS-PLUS**

# How to look like the DEC\* STREAMING TAPE SYSTEM without really buying.

You don't have to buy the delivery delays and higher prices asked for the complete DEC TU 80 Streaming Tape subsystem. Our top loading Streamer Cabinet is identical in appearance to the standard DEC units, yet it is available immediately and costs about 20% less.

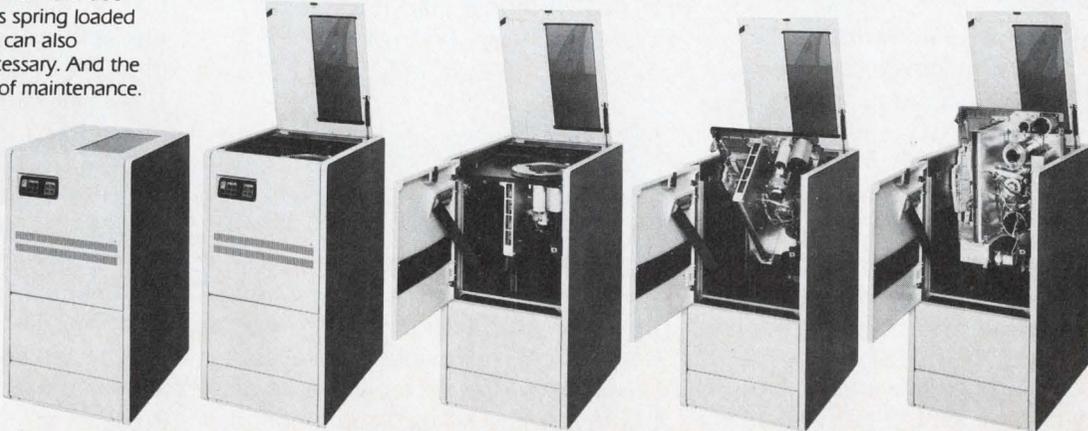

Besides being a perfect fit for the time and budget conscious designer, the Control Data family of Keystone start/stop tape drives can be horizontally mounted into our cabinet, too.

So why box yourself into a single supplier if you don't have to? For more than seven years we've given system designers a choice. After all, we like to make you look good too.

Get all the details today and ask about our complete line of DEC compatible products.

The Everest Cabinets feature a front door mounted control panel, gas spring loaded operator access cover, and can also accommodate a disk, if necessary. And the tape drive rotates for ease of maintenance.

\*DEC is a trade mark of Digital Equipment Corporation

CIRCLE D199 ON READER CARD

Portable SAS System in booths 632-634 at DEXPO/East. The Portable SAS System will run on Digital Equipment Corp.'s VAX™ 11/7xx series under VMS™. Included in the Beta test version, available for a 90-day free trial, will be:

- SAS®—for data management, statistical analysis, and report writing
- SAS/GRAPH™—for color graphics presentations
- SAS/FSP™—for interactive data entry, edit, retrieval, and letter writing applications.

After testing is completed and the production versions are available, the Institute's standard 30-day free trial for new software will apply. The Portable SAS System under VMS will also be available from Digital Equipment Corp. under a cooperative marketing agreement between Digital and the Institute.

First-year licenses for SAS from the Institute range from \$5000-7500, depending on the machine being used. Yearly renewals are \$2800. Additional SAS products are licensed separately. Call for additional information (919) 467-8000.

#### NORTHWEST DIGITAL SOFTWARE HAS NEW TUNING PACKAGE

Newport, WA — RPM, a new performance tuning package from Michael Mayfield and Northwest Digital Software, substantially extends the performance data collection capabilities of the RSTS/E monitor to provide the information needed to effectively tune system performance.

Additional overall performance data includes information on seek distance, file placement, small buffers, memory usage, file processor (FIP) usage, cache efficiency.

Additional performance data on programs includes CPU, FIP, memory, disk and cache usage, response time and swapping. Data on files includes disk and cache usage.

By collecting all this additional information on system performance, RPM is able to identify performance bottlenecks and show how to correct them. RPM is the only product

that can do all this.

For more information, contact Northwest Digital Software, Inc. at Box 2-743, Spring Valley Road, Newport, WA 99156, (509) 447-2620 or see us at booth E, DEXPO East 83.

#### EG&H TO EXHIBIT KDSS

Lexington, MA — Evans Griffiths & Hart, Inc. announces the release of a VAX/VMS version of KDSS, its key-to-disk data entry software package. KDSS, a widely-used package which in 1980 received an ICP Million Dollar Award, has previously been available for use only on DEC PDP-11 computers, under either the RSTS/E or RSX-11M operating system. Now a version of KDSS compatible with the PDP-11 versions is available for use on any model of DEC's VAX-11 computer under the VAX/VMS operating system. KDSS, running concurrently with other applications on a PDP-11 or VAX-11 computer, permits the use of a portion of the resources of the system as a powerful and flexible multi-terminal data entry system.

VAX/VMS KDSS is available under a single-computer perpetual license for \$9,000.00 (special rates are available for single-customer multiple-computer situations). One year of support is included in the license price. Support is available after that year for a yearly fee.

KDSS will be demonstrated at DEXPO/EAST 83 in St. Louis, Missouri, May 22-24, 1983.

For further information contact Evans Griffiths & Hart, Inc., 55 Waltham Street, Lexington, MA 02173. Tel: (617) 861-0670.

#### RELIANCE ELECTRIC OFFERS DEC PRODUCTS REPAIR BOOK

Cleveland, OH — A new four-page illustrated brochure describing how the Reliance Electric Digital Products Repair Center provides fast, reliable repair, exchange or replacement of PC Boards and related equipment is now available.

The file-size brochure points out that the Digital Products Repair

Center is equipped to solve every possible kind of PC Board problem through the use of advanced, state-of-the-art equipment and instrument calibration procedures.

To obtain a copy of the New Digital Products Repair Center Brochure — H-2661-2 — write to Reliance Electric Company, 24701 Euclid Avenue, Cleveland, OH 44117.

#### NATIONAL INSTRUMENTS OFFERS INTERFACE

Austin, TX — The GPIB-796 is the latest addition to National Instrument's GATEWAY-488 family of Computer to IEEE-488 interfaces. This interface module makes it possible to transfer data between the Multibus and the IEEE-488 bus. This capability expands National Instrument's IEEE-488 product line which presently supports access from Digital Equipment Corporation and S-100 computers to the IEEE-488 Bus.

The design of the GPIB-796 interface was targeted towards providing IEEE-488 access to high-end Multibus systems based on 32-bit microprocessors such as the Motorola 68000, while maintaining a cost effective product that is compatible with 16 and 8-bit microprocessors such as the 8086 and the Z-80. The interface can be used as an IEEE-488 Talker, Listener or Controller and conforms to the proposed IEEE-796 bus specification.

National Instrument's software drivers for the GPIB-796 will support high level operating systems. The first software package for the interface is compatible with the UNIX operating system and will be offered as a support option.

Other IEEE-488 software modules will be written in C as well as assembly languages for the popular microprocessors used on Multibus systems such as 8086/8088 and Z80/8080. These driver modules will also be linked to the popular higher level languages beginning with BASIC.

Full documentation is provided with the interface in the form of a 160 page user's manual. A choice of

cable options include a short flat cable with a rear-panel-mount GPIB connector and a longer (2 or 4 meter) round cable with a standard GPIB connector. The GPIB-796 in single unit quantities is priced at \$1295 with OEM discounts available on request. For further information contact Frances Drury at (800) 531-5066 (outside Texas) or (512) 250-9119. Delivery is from stock.

#### NEWMAN TO EXHIBIT

Ann Arbor, MI — Newman Computer Exchange will be an exhibitor at DEXPO EAST '83 (the Third National DEC-Compatible Exhibition, St. Louis Kiel Auditorium, May 22-24, 1983.) The multi-million-dollar firm is the nation's largest dealer in new and used DEC and Data General systems, processors and peripherals, including an extensive stock of PDP8 equipment. A charter DEXPO exhibitor, Newman markets late-model minicomputer equipment, by direct mail and telephone, to major corporations, universities, and government and military agencies.

Qualified personnel will staff the Newman booth (#201) to provide equipment appraisal and other firsthand information. Also available: catalogs, literature and free signup for mailing cycle, as well as the Newman "Blue Book" on converting surplus minicomputer equipment to cash. (These materials may also be requested direct from Newman Computer Exchange, P.O. Box 8610, Dept. P53J-DX, Ann Arbor, Michigan, 48107, (313) 994-3200.)

#### DISC TO INTRODUCE COMBINATION PACKAGE

Sacramento, CA — Digital Information Systems Corporation (DISC) will be exhibiting again at DEXPO.

At the show, DISC will be introducing to Systems Integrators and OEM's a combination package that includes DISC's DBL and S&H Computers Inc's TSX-Plus and RTSORT. The combination package costs integrators anywhere from \$1420 for 5 copies to \$1154 for 100 or more.

DBL is a structured source code compatible superset of Digital Equipment Corporation's DIBOL-11 language. DBL is currently available for DEC's RT-11, RSTS, RSX-11M and VAX/VMS environments as well as for S&H's TSX and TSX-Plus Time Sharing Extension to RT-11 on DEC minicomputers. DISC recently released DBL/VMS, the latest in the DBL series of compiler and runtime systems, for use in native mode under the VAX/VMS operating system. Early users of the product cite the in-line code and /BIND facilities as the major system performance enhancement features, which, when used with the structured extensions to the DIBOL-11 language provide an efficient and easily maintainable programming environment.

Additional product and pricing information may be obtained from DISC, 3336 Bradshaw Road, Suite 340, Sacramento, CA 95827, (916) 363-7385 or at their DEXPO EAST '83 booth #430.

#### VAX TRAINING FROM ESSENTIAL RESOURCES

New York, NY — Essential Resources, Inc., (ERI) a company devoted to training on DEC systems, is pleased to announce a new course offering: *VAX Operator Training*. This offering is derived from an extensive study of the VAX operations environment. The course is the newest addition to the growing list of courses offered for DEC Operating Systems, UNIX, Applications Languages, and Layered Software.

The three day course is provided at the client site, in the environment where the Operator will perform. The purpose of this course is to enhance the efficiency of the Operator by broadening his understanding of the VAX hardware, the VMS Operating System, and the system messages which require his attention. Creating and running command procedures is covered in depth.

All courses offered by ERI are custom tailored to the requirements of the client. A preliminary skills and task analysis is performed so

that appropriate course modifications can be made. The total service is performed for a reasonable cost. This results in efficient training in terms of both time and money.

ERI will be available at DEXPO EAST 83, booth number 405, to discuss your training requirements. You may also contact them by phone at (212) 956-5988.

#### IMSL RELEASES EDITION 9 OF FORTRAN LIBRARY

Houston, TX — IMSL, Inc. has announced the release of Edition 9 of the IMSL Library for the Digital Equipment System, 10/20, VAX-11 Series, and PDP-11 Series. This version of the widely used Library has an additional 40 subroutines which bring the total to 540. Used internationally, it was designed for maximum accuracy and efficiency in mathematical and statistical problem solving.

The IMSL Library is a comprehensive set of FORTRAN subroutines which serve as building blocks that are used to save costly programming time in developing scientific and engineering application programs. They are arranged in 17 chapters, covering the total field of mathematics and statistics.

Major new subroutines for Edition 9 have been added in areas of basic statistics, differentiation, differential equations, quadrature, eigensystem analysis, random number generation, interpolation, approximation, smoothing, linear algebraic equations, special functions, utility functions, optimization, sorting, and zero and extremas.

For the Digital Equipment computer, the annual subscription rates for IMSL Library are \$2,000 — \$2,500 for initial subscriptions, and \$1,500 — \$2,000 for renewals. For universities, the subscription rate is discounted 40%. For additional information contact IMSL, Inc. Sixth Floor — NBC Building, 7500 Bellaire Blvd., Houston, Texas 77036, USA, telephone (713) 772-1927, outside Texas call toll free (800) 231-9842, or telex 79-1923 IMSL INC HOU.

# NEW PRODUCTS

## SOUTHERN SYSTEMS DEBUTS ION DEPOSITION PRINTER

Fort Lauderdale, FL — The first non-impact computer printer system based on ion deposition imaging has been introduced by Southern Systems Inc.

Called the Mercurion 1, the 60 page per minute, letter-quality printer system is both a lower-cost alternative to laser xerographic systems and a direct replacement for high-speed impact line printers.

At a single-unit price of about \$60,000, Mercurion is some 50 percent less than comparable-speed non-impacts that use laser xerography. Mercurion's per-page operating costs also are projected to be about 50 percent less.

Mercurion 1 uses standard plain paper, 8½" by 11" as well as metric sizes. Either landscape or portrait format may be selected. An operator-friendly pushbutton control panel is used to set margins, to select various fonts (up to eight may be resident in the printer), to program number of copies (1 to 255), and to handle self-test.

Plug-compatible with all major mini and mainframe computers, Mercurion can replace an existing impact line printer *without operating system software changes*. Orders for delivery by first quarter 1983 are now being taken for Southern Systems' new Mercurion 1 which will be manufactured at the company's Clearwater, FL plant.

Southern Systems Inc., leads the add-on printer market, with more than 6,000 printer installations across the United States and in Europe. Southern Systems is located at 2841 Cypress Creek Road, Fort Lauderdale, FL 33309. (305) 979-1000, (800) 327-5602, Telex 522135.

## EVEREST INTRODUCES STREAMER CABINET

Anaheim, CA — A lower cost alternative to the recently introduced DEC TU 80 streaming tape subsystem is being offered by Everest Electronic Equipment, who has designed an enclosure for Control Data's family of Keystone start/stop tape drives.

The top loading Everest Streamer Cabinet is identical in appearance and configuration to the standard VAX enclosure that houses the DEC TU 80 subsystems, yet it is priced about 20% less, according to Everest sales manager Charles Schroder.

The new Everest cabinet is designed to be compatible to all systems as an add-on unit as well as house the Control Data streaming tape that enables system designers with VAX-11/750 or VAX-11780 processing power to configure systems with low cost expansion capability.

The cabinet features a front door mounted control panel, gas spring loaded operator access cover, and horizontal mounting of the Control Data Keystone Tape Drive. In addition, there is a 10½ inch space below where the tape drive is mounted to accommodate a disk if desired and the drive rotates for ease of maintenance.

Headquartered in Southern California, Everest has been providing system designers with DEC compatible cabinets for more than seven years. For additional information on the streamer cabinet or any of the complete line of DEC compatible cabinets manufactured by Everest contact: Chuck Schroder, Sales Manager, 2100 E. Orangewood Avenue, Anaheim, California 92806. 714/634-2200.

## The missing link. PDP-11/VAX Interconnect to IBM, CDC, DEC and others — with 12 years field experience.

HASP+ has an International Who's Who customer list. You can join them on a no risk trial, PLUS a low, low price.

HASP+ is highly versatile. Can operate as a host or remote work station, supports auto-dial, and more. HASP+ uses standard DEC communications hardware.

VAX single systems, \$5,500; 15 systems \$2,500 each. PDP-11 prices slightly lower.

## PRODUCT UPDATES

### BENCHMARK MONITOR FOR RSX

Calgary, Alberta, CANADA — The BENCHMARK MONITOR for RSX is

a software product which takes actual measurements in a running PDP-11 computer system in order to identify the utilization of its various components. These measurements can be used to determine the system load during a benchmark, to identify what can be done to get higher performance from a particular computer system, or to document available capacity in a system before increasing its workload.

The BENCHMARK MONITOR identifies which programs have the greatest impact on your PDP-11, and hence have the greatest potential for improvement. It also tells you whether you can expect faster disk accesses by moving files or re-ordering them.

The units in which all figures are reported have been specifically chosen to simplify the comparison of benchmarks of different durations with one another, as well as with manufacturers' device specifications. If you are interested in other performance figures, please ask us for the kind of report you would like.

The software requires only loadable device driver support, and can be installed in minutes, as no sysgen is necessary. No additional hardware is required. The BENCHMARK MONITOR is available for both versions 3.2 and 4.0 of RSX-11M, and pricing starts at \$1000.00 per CPU. Contact Daniel Computing Systems, Inc., 351 Maitland Hill, NE, Calgary, Alberta T2A 5V4, (403) 273-2657.

**GDI ANNOUNCES  
SERIAL COMMUNICATIONS  
PROCESSOR**

Huntsville, AL — Designed to unburden PDP-11 / LSI-11 host computers from time-consuming serial input/output processing, GDI's SCP provides high speed buffered DMA to the host computer memory. The SCP is a single quad board with an on-board 2 MHz Motorola 6809 microprocessor and 60K bytes of local RAM. Two independent, full duplex transmitters/re-

ceivers provide program controlled I/O or DMA between host memory and local RAM. Asynchronous, byte synchronous or bit synchronous modes of operation are individually selectable for each of the two serial ports. SDLC/HDLC and CCITT X.25 compatible.

The 6809 is user programmable and is supplied with a PDP-11/LSI-11 based software development system that includes a 6809 assembler and down-line loader.

The SCP is priced at \$2,495.00. Substantial quantity discounts are available. Delivery is 30 days ARO. For further information contact General Digital Industries, 7702 Governors Drive, Huntsville, AL 35805. Telephone (205) 837-8305.

**TRANSTECTOR OFFERS  
OVERVOLTAGE PROTECTION**

Post Falls, ID — Transtector Systems, the world's oldest and largest manu-

facturer of solid-state transient overvoltage protection equipment, offers a complete line of transient suppression systems designed specifically for use with Digital Computers. Systems range from small plug-in units to large panel protectors, all providing response times of five nanoseconds or less, low voltage clamping points and an automatic reset to the ready state.

Transtector products have been proven effective during 12 years of actual in-field service with DEC equipment, providing absolute protection against transient overvoltages — the most common cause of damage in solid-state electronic equipment. Those products available for DEC applications include:

- 1) The ACP3000 Panel Protector for use with the DEC PDP 11/44, PDP 11/70, VAX 750 and other systems using a dedicated branch panel;
- 2) The CPS150 Plug-In Protector for use with the DEC LSI 11/23, PDP 8, PDP 34 and other systems not

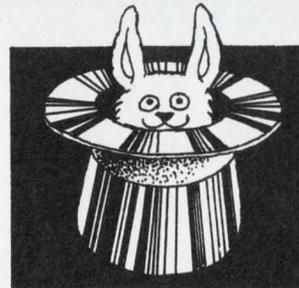

# MAGIC/L

*The Simple Software Solution  
For Difficult Hardware Development*

MAGIC/L, the interactive programming language that brings whole systems to your fingertips, is now available for \$950.

MAGIC/L directly accesses all RSX system resources and offers a single consistent environment that lets you:

- Run tasks and MCR commands
- Edit your previous command line
- Ideal basis for customized user environments

- Invoke all RSX executive directives
- Access the I/O page
- Write assembly code
- Write programs in simple MAGIC/L syntax

Optimize your productivity with MAGIC/L's blend of Pascal-like syntax and Fort-like extensibility. It is available for RT-11 as well as Data General and 68000-based systems.

Meet MAGIC/L now!

requiring a dedicated panel for power supply;

3) The ACP100BL Plug-In Protector for use with the DEC LA and VT model terminals;

4) The Data/Signal Line Family of Protectors — LMP4, TSJ6 & 8, DLP3 and FSP 4000, for use with leased lines, dial-up modes, RS232, RS422 and current loop protection for DEC systems.

For complete details on these or other Transector overvoltage protection devices, call toll free 1-800-635-2537.

**DEC COMPATIBLE  
DISK DRIVES AT DEXPO**

Santa Barbara, CA — Disc Tech One has introduced three new products in their line of 14" Winchester disc drives: an IBM — PC plug compatible 80 Megabyte disc drive subsystem and two DEC-compatible disc drives.

Disc Tech One has also introduced two higher-capacity DEC-compatible disc drives: an 80-Megabyte (Model 3306) and

160-Megabyte (Model 4160) disc drive. Model 3306 emulates Control Data's Model No. 9762 for the RMO-2 and has a 5-year proven reliability. Model 4160, which is compatible to two RA-80's, was designed by the same staff of engineers as the 3306. This DEC-compatible disc drive has all the same DTO features including the patented rotary positioner, clean air package, quiet performance, and compact rack-mountable size. The price for all DTO disc drives includes rails, SMD interface, and an integrated power supply. Disc Tech One, Inc. is located at 849 Ward Drive, Santa Barbara, California 93111.

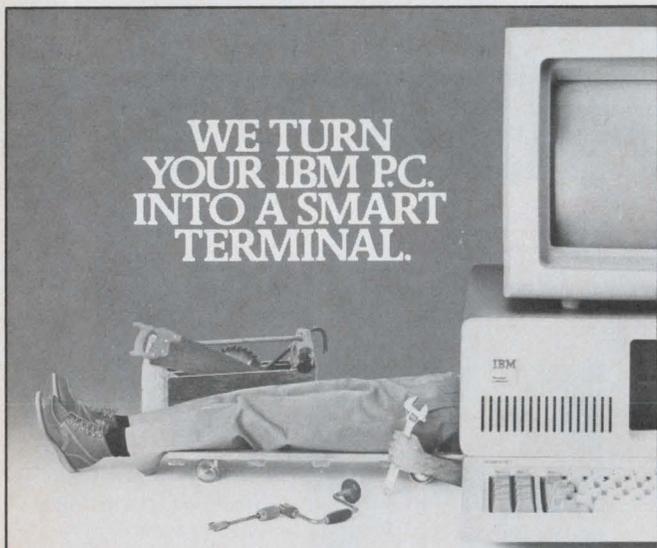

**PERIPHERAL PARTS SUPPORT  
OFFERS ALTERNATIVE**

Cambridge, MA — Peripheral Parts Support, a company dedicated to providing maintenance organizations and End Users with alternative sources for repairing and replacing spare parts for Digital and other manufactured peripheral equip-

ment, will be exhibiting at DEXPO EAST 83.

PPS, established in early 1982, provides End Users or companies maintaining peripheral equipment with off the shelf delivery of low cost Absolute Filters for most models of Disk Drives. In addition, PPS distributes Disk Packs and Cartridges as well as Disk Drive Alignment Tools and Static Eliminator Equipment for the high speed printer market. Also, a significant element in PPS' organization is the services provided for PCBA repair, Disk Head and Spindle Reconditioning, and Tape Head Repair.

PPS' main strategy is to "offer an alternative source for peripheral equipment users to turn to in order to improve upon service levels provided by OEM's and to lower the cost of maintenance in support of Disks, Printer and Tape products" which PPS feels they can offer to most peripheral equipment users. For further information contact Peripheral Parts Support, 110 Rindge Avenue Extension, Cambridge, MA, 02140, (617)-491-3041.

**WE TURN  
YOUR IBM P.C.  
INTO A SMART  
TERMINAL.**

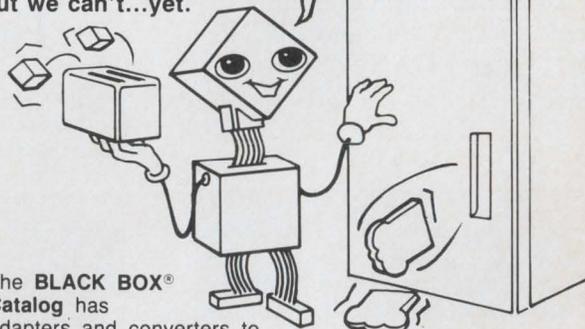

You don't really need to get your hands dirty to turn your IBM PC into a DEC VT100 and VT52 compatible intelligent workstation. All you need is VTERM, Saturn Consulting Group's terminal emulation software. VTERM's features include full VT100 keyboard and video emulation, throughput to 9600 baud, printer support, and PC-Host file exchange, in addition to the standard capabilities of an asynchronous communications package. Call or write today. Our software mechanics are standing by.

DEC USERS: STOP TRANSIENT OVERVOLTAGE PROBLEMS NOW!

# ACP 3000

Transient Protection  
Designed Specifically for  
DEC Models PDP 11/44,  
PDP 11/70, VAX 750 and  
any other systems using  
a dedicated branch panel.

Transtector® Systems has been building transient suppression equipment specifically for Digital Computers since 1970, providing cost effective protection to DEC users across the nation. Join the growing number of major corporations who are discovering Transtector — the choice of field service engineers. To learn more, call us toll free today at 1-800-635-2537 and end your powerline pollution problems.

# ABOUT TECHNICAL PUBLICATIONS

## **TEXT/comp TURNS YOUR DEC WORD PROCESSOR INTO A TYPESETTER**

With TEXT/comp by International Graphics the common diskette or magnetic tape can be a time-saving link between your DEC word processing system and a typeset, printed publication. In effect, your approved galley proof.

Now you can have total control of your database without the high cost of data re-entry for typesetting. TEXT/comp, the unique composition language, eliminates the need for typesetting commands as you create your text.

You simply enter the data on your DEC word processing equipment using TEXT/comp. Data entered can include title pages, table of contents, introductory material, indexing and document body — from simple text to complex tabular data.

**TEXT/comp is a cover-to-cover composition system. It lets you edit and update your files quickly, easily, accurately. With minimal coding you can printout and proofread your document just as it will appear in completed form.**

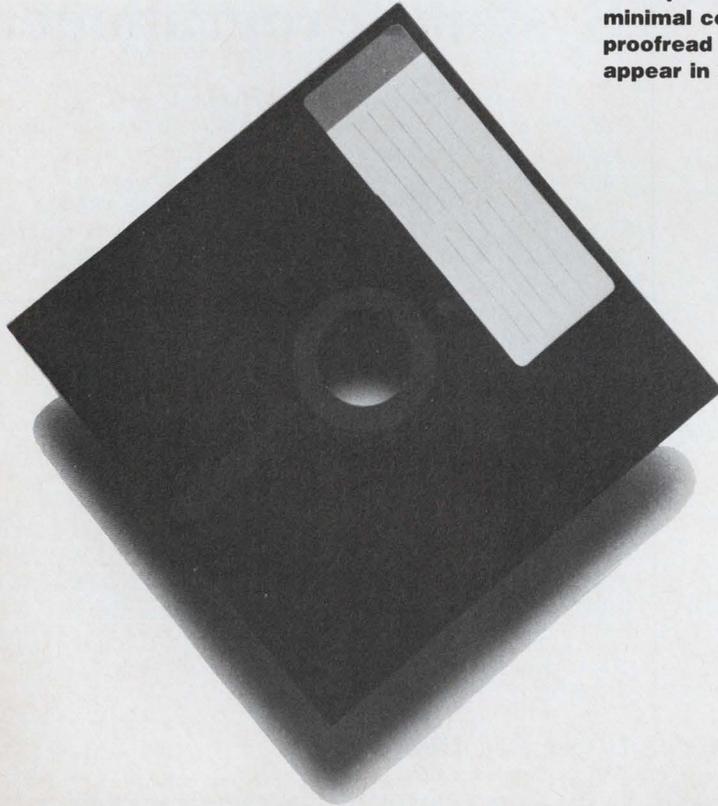

Once corrected and approved, International Graphics will typeset, print, bind and distribute your technical masterwork.

**TEXT/comp. The common diskette is now an uncommon publication.**

Write or call us for complete details.

## Systems Programmers

Lawrence Livermore National Laboratory is seeking DECSYSTEM-10 Systems Programmers to support the Magnetic Fusion Energy Program's User Service Center. Successful candidates should possess a Bachelor's Degree in computer science or related field. In addition, experience with the TOPS-10 or TOPS-20 operating system, associated application languages and support software is necessary. MACRO-11 experience would be considered a plus.

Responsibilities include:

- Installation, maintenance, and documentation of system software
- Software development for an in-house local area network
- Software development for an in-house high speed graphics system

Qualified candidates are requested to send detailed, confidential resumes to: Sue Porter, Employment Division, LAWRENCE LIVERMORE NATIONAL LABORATORY, P.O. Box 5510, KDC-053, Livermore, CA 94550. No agencies please.

U.S. Citizenship is required.

## OPPORTUNITIES IN REAL-TIME SYSTEMS DEVELOPMENT

Wyle is seeking high-level computer professionals with VAX/VMS and UNIX operating systems experience in a real-time data acquisition and control environment. Qualified candidates will have a minimum of 10 years experience and a B.S. in Engineering or Computer Science.

This is a ground-floor opportunity in a new department developing software and hardware to support testing of state-of-the-art aircraft in the wind tunnels at NASA's Langley Research Center, Hampton, Virginia.

If you are seeking a technical challenge and a location that offers a mild climate and extensive recreational attractions contact L. Stewart at (804) 865-0000 or send resume to:

# Do you think modems are all the same?

If so, you're right, more or less! But, if you have 'dumb' terminals or a minicomputer from DEC, Data General, Hewlett-Packard, or anyone else, you'll agree that MICOM's modems are very different.

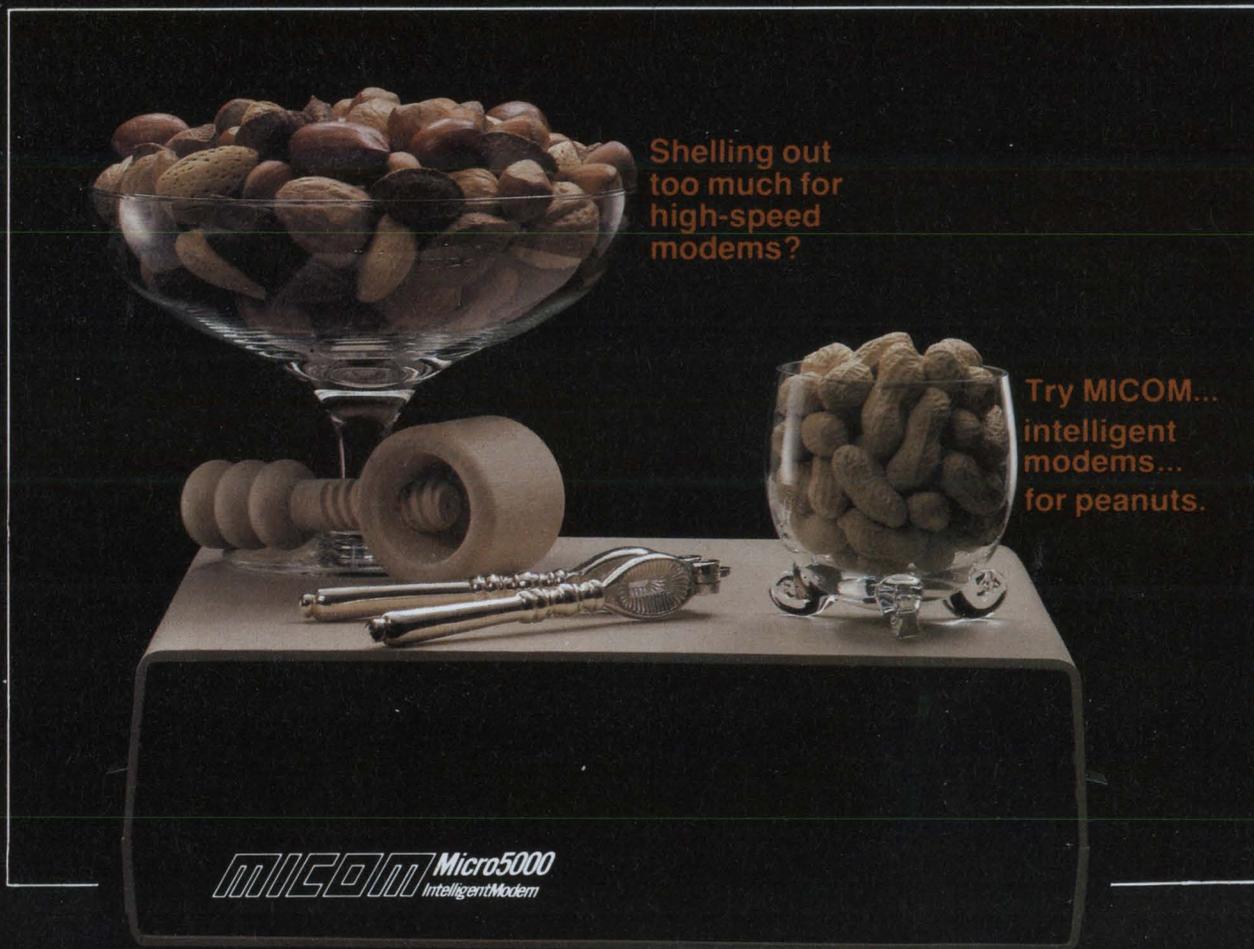

Our Micro5000 Intelligent Modem, for example, includes a unique retransmission-on-error feature. It automatically eliminates those phone line 'glitches' which drive your CRT's crazy — that's intelligent! The Micro5000 is capable of delivering error-free transmission at speeds to 9600 bps on telephone lines with error rates worse than 1 in 10<sup>4</sup>. The Micro5000 even offers error-free transmission through total line outages of several seconds — *that's different!*

And, with our Micro8000 Concentrator Modem, you

can even support clusters of asynchronous terminals attached to a single telephone line with error-free operation for all of them. By sharing one line between several terminals, the Micro8000 can save you a bundle in line costs — *that's different!*

But, if all you need is a low-cost 2400 bps modem without the sophistication of retransmission-on-error, try our Micro4000 Data Modem. Its asynchronous terminal interface is specially designed for use with 'dumb' terminals and minicomputers — *that's different!*

For complete details of the MICOM difference, call or write today . . . better still, why not call and order a pair on a 30-day sale-or-return basis. No strings attached! We know you'll love it.

Shelling out  
too much for  
high-speed  
modems?

Try MICOM...  
intelligent  
modems...  
for peanuts.

**MICOM** Micro5000  
Intelligent Modem

# ACCESS

## Access the X.25 world. Today.

*A Unibus/DMA system that provides DEC minicomputers access to X.25 networks. Great!*

Today's X.25 public networks offer an alternative to the high cost of dedicated lines and the slow speed of dial-up connections. ACC's X.25 products help major government agencies and Fortune 500 companies take advantage of this alternative.

Our products plug directly into your DEC host's UNIBUS or LSI-11 Bus. They off-load X.25 protocol processing and transfer data to your host CPU by means of high-speed Direct Memory Access (DMA).

### **Three DEC/X.25 Interfaces.**

ACC has three major X.25 products to meet the requirements of your application. All are microprocessor based. All are certified for operation on Telenet and other public packet networks. All comply with CCITT's Recommendation X.25 for levels 1, 2, and 3. And all are available for delivery today.

**1. Terminal Networking.** With the IF-11/X.25 PLUS, remote X.25 network terminals can access your host as if they were locally connected. The IF-11/X.25 PLUS can be configured to support any combination of up to 32 local and remote terminals. Additionally, local terminal users have the option of connecting to other hosts on the X.25 network. All PAD (Packet Assembly/Disassembly) functions (CCITT X.3, X.28, X.29) are coded into subsystem firmware, without impacting your host CPU.

**2. High Speed File Transfer.** The IF-11/X.25 connects your host to an X.25 network. It provides up to 32 full-duplex virtual circuit connections to a VAX or PDP-11, at line speeds of 56 Kbps (with even faster line speeds available). The IF-11/X.25 is ideal for file transfer applications to remote network locations or for any application that needs direct access to an X.25 network.

**3. LSI-11 Bus Systems.** The IF-11Q/X.25 network access system is functionally identical to the IF-11/X.25, but designed for your PDP-11/23.

**Access Is Our Business.** For over a decade, beginning with ARPANET, ACC personnel have designed and manufactured a variety of systems to access packet-switched networks. ACC's X.25 products are designed to meet your custom applications. For example, we have customized X.25 systems with the following options: (a) 256 byte packet size, (b) ADCCP frame level, (c) Point to Point capability (DCE version).

**If you need access to the world of X.25, phone us at (805) 963-9431. Today.**

**Accessing the World ... Today.**

# IB Graph for DEC users. If it wasn't so interactive, it wouldn't be used.

At Data Processing Design, we do one thing very well. Better than anyone else, in fact. We provide quality software for Digital Equipment Corporation computer systems. We call it Used Software, and it's the most thoroughly tested, well thought-out, and debugged family of software in the DEC-compatible industry.

Our latest product is IB Graph™, the complete system for business graphics on DEC PDP-11™ and VAX™ systems. It's a multi-user, interactive business graphics system that lets you quickly and easily prepare a wide variety of charts— including pie charts, bar charts, and line charts.

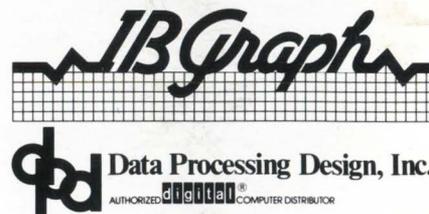

IB Graph lets you enter data interactively or convert data from other formats, such as data processing files (including RMS files), or list processing documents (created through WORD-11™ or DECWORD™). Now you can store the definition of charts and recall and modify these definitions to create exactly the chart you need, when you need it.

And IB Graph is easy to use. Anyone can produce charts in a few minutes that used to take days to develop. It's menu-oriented and includes hundreds of help screens. Furnishing you with the kind of instant direction you'll need while learning

IB Graph's operations. Which won't take long, either.

So if you'd like to know more about IB Graph, call or write to us at DPD. We'll be happy to provide you with all the information you need on our newest Used Software product.

And how using it to make your company more productive is as easy as, well, pie.
