ししし

## GLOSSARY

A REGISTER – Principal arithmetic register; operates as a 24-bit additive accumulator (modulus 2<sup>24</sup>-1).

ABSOLUTE ADDRESS-Synonymous with Address.

ACCESS TIME – The time needed to perform a storage reference, either read or write. In effect, the access time of a computer is one storage reference cycle.

ACCUMULATOR-A register with provisions for the addition of another quantity to its content.

ADDER-A device capable of forming the sum of two or more quantities.

ADDRESS-A 15-bit operand which identifies a particular storage location; a 17-bit operand which identifies a particular character location in storage.

ADDRESS MODIFICATION – Normally the derivation of a storage address from the sum of the execution address and the contents of the specified index register.

AND FUNCTION – A logical function in Boolean algebra that is satisfied (has the value "1") only when all of its terms are "1's". For any other combination of values it is not satisfied and its value is "0".

ARGUMENT – An operand or parameter used by a program or an instruction.

- ASSEMBLER A program which translates statements to machine language. Normally, one source language statement results in the generation of one line of object code.
- BASE-A quantity which defines some system of representing numbers by positional notation; radix.
- BINARY-CODED DECIMAL (BCD) A form of decimal notation where decimal digits are represented by a binary code.

BIT-Binary digit, either "1" or "0".

BLOCK-A sequential group of storage words or characters in storage.

- BOOTSTRAP Any short program which facilitates loading of the appropriate system executive.
- BRANCH-A conditional jump. Refer to Jump.

BREAKPOINT – A point in a routine at which the computer may be stopped by manual switches for a visual check of progress.

- B<sup>1</sup>, B<sup>2</sup>, B<sup>3</sup> REGISTERS-Index registers used primarily for address modification and/or counting.
- BUFFER Any area that is used to hold data temporarily for input or output, normally storage.

BYTE - A portion of a computer word.

C

C

- CAPACITY The upper and lower limits of the numbers which may be processed in `a register, or the quantity of information which may be stored in a storage unit. If the capacity of a register is exceeded, an overflow is generated.
- CHANNEL-An Input/Output (I/O) transmission path that connects the computer to an external equipment.
- CHARACTER-A group of 6 bits which represents a digit, letter or symbol from the typewriter.

- CLEAR-An operation that removes a quantity from a register by placing every stage of the register in the "0" state. The initial contents of the register are destroyed by the Clear operation.
- COMMAND Synonymous with Instruction.
- COMPILER A program with the compatability to generate more than one line of machine code (instruction or data word) from one source language statement.
- COMPLEMENT-Noun: See One's Complement or Two's Complement. Verb: A command which produces the one's complement of a given quantity.
- CONTENT The quantity or word held in a register or storage location.
- CORE A ferromagnetic toroid used as the bi-stable device for storing a bit in a memory plane.
- COUNTER A register or storage location, the contents of which may be incremented or decremented.
- D REGISTER-A 4-bit field length register used for BCD operations.
- DOUBLE PRECISION Providing greater precision in the results of arithmetic operations by appending 24 additional bits of lesser significance to the initial operands.
- ENTER The operation where the current contents of a register or storage location are replaced by some defined operand.
- EQUALIZE Adjusting the operand of the algebraically smaller exponent to equal the larger, prior to adding or subtracting the floating point coefficients.
- EXCLUSIVE OR-A logical function in Boolean algebra that is satisfied (has the value "1") when any of its terms are "1". It is not satisfied when all its terms are "1" or when all its terms are "0".
- EXECUTION ADDRESS-The lower 15 or 17 bits of a 24-bit instruction. Most often used to specify the storage address of an operand. Sometimes used as the operand.
- EXIT-Initiation of a second control sequence by the first, occurring when the first is near completion; the circuit involved in exiting.
- F REGISTER Program Control register. Holds a program step while the single 24-bit instruction contained in it is executed.
- FAULT Operational difficulty which lights an indicator or for which interrupt may be selected.
- FIXED POINT A notation or system of arithmetic in which all numerical quantities are expressed by a predetermined number of digits with the binary point implicitly located at some predetermined position; contrasted with floating point.
- FLIP-FLOP (FF)—A bi-stable storage device. A "1" input to the set side puts the FF in the "1" state; a "1" input to the clear side puts the FF in the "0" state. The FF remains in a state indicative of its last "1" input. A stage of a register consists of a FF.
- FLOATING POINT A means of expressing a number, X, by a pair of numbers, Y and Z, such that  $X = Yn^{Z}$ . Z is an integer called the exponent or characteristic; n is a base, usually 2 or 10; and Y is called the fraction or mantissa.
- FUNCTION CODE See Operation Code.
- INCREASE The increase operation adds a quantity to the contents of the specified register.
- INDEX DESIGNATOR A 2-bit quantity in an instruction; usually specifies an index register whose contents are to be added to the execution address; sometimes specifies the conditions for executing the instruction.

In .

INDIRECT ADDRESSING – A method of address modification whereby the lower 18 bits of the specified address become the new execution address and index designator.

- INSTRUCTION A 24- or 48-bit quantity consisting of an operation code and several other designators.
- INTEGRATED REGISTER FILE The upper 6410 locations of core storage. Reserved for special operations with block control.
- INTERRUPT A signal which results in transfer of control, following completion of the current instruction cycle, to a fixed storage location.
- INTERRUPT REGISTER A 24-bit register whose individual bits are set to "1" by the occurrence of specific interrupt conditions, either internal or external.
- INTERRUPT MASK REGISTER -- A 24-bit register whose individual bits match those of the Interrupt register. Setting bits of the Interrupt Mask register to "1's" is one of the conditions for selecting interrupt.
- INVERTER-A circuit which provides as an output a signal that is opposite to its input. An inverter output is "1" only if all the separate OR inputs are "0".
- JUMP An instruction which alters the normal sequence control of the computer and, conditionally or unconditionally, specifies the location of the next instruction.

LIBRARY – Any collection of programs (routines) and/or subprograms (subroutines).

- LOAD The Load operation is composed of two steps: a) The register is cleared, andb) The contents of storage location M are copied into the cleared register.
- LOCATION A storage position holding one computer word, usually designated by a specific address.
- LOGICAL PRODUCT In Boolean algebra, the AND function of several terms. The product is "1" only when all the terms are "1"; otherwise it is "0". Sometimes referred to as the result of bit-by-bit multiplication.
- LOGICAL SUM-In Boolean algebra, the OR function of several terms. The sum is "1" when any or all of the terms are "1"; it is "0" only when all are "0".
- LOOP-Repetition of a group of instructions in a routine.
- MACRO CODE A method of defining a subroutine which can be generated and/or inserted by the assembler.
- MASK In the formation of the logical product of two quantities, one quantity may mask the other; i.e., determine what part of the other quantity is to be considered. If the mask is "0", that part of the other quantity is unused; if the mask is "1", the other quantity is used.
- MASTER CLEAR-A general command produced by pressing one of two switches: a) Internal Master Clear-Clears all operational registers and control FF's in the processor. b) External Master Clear-Clears all external equipments and the communication channels.
- MNEMONIC CODE-A three- or four-letter code which represents the function or purpose of an instruction. Also called Alphabetic Code.
- MODULUS An integer which describes certain arithmetic characteristics of registers, especially counters and accumulators, within a digital computer. The modulus of a device is defined by r<sup>n</sup> for an open-ended device and r<sup>n</sup>-1 for a closed (end-around) device, where r is the base of the number system used and n is the number of digit positions (stages) in the device. Generally, devices with modulus r<sup>n</sup> use two's complement arithmetic; devices with modulus r<sup>n</sup>-1 use one's complement.

- NORMALIZE To adjust the exponent and mantissa of a floating point result so that the mantissa lies in the prescribed standard (normal) range.
- NORMAL JUMP-An instruction that jumps from one sequence of instructions to a second, and makes no preparation for returning to the first sequence. Also referred to as an Unconditional Jump.
- NUMERIC CODING-A system of abbreviation in which all information is reduced to numerical quantities. Also called Absolute or Machine Language coding.
- OBJECT PROGRAM-The machine language version of the source program.
- ONE'S COMPLEMENT With reference to a binary number, that number which results from subtracting each bit of a given number from "1". The one's complement of a number is formed by complementing each bit of it individually, that is, changing a "1" to "0" and a "0" to a "1". A negative number is expressed by the one's complement of the corresponding positive number.
- ON-LINE OPERATION A type of system application in which the input or output data to or from the system is fed directly from or to the external equipment.
- OPERAND-Usually refers to the quantity specified by the execution address.
- OPERATION CODE (Function Code) A 6-bit quantity in an instruction specifying the operation to be performed.
- OPERATIONAL REGISTERS-Registers which are displayed on the operator's section of the console.
- OR FUNCTION-A logical function in Boolean algebra that is satisfied (has the value "1") when any of its terms are "1". It is not satisfied when all terms are "0". Often called the inclusive OR function.
- OVERFLOW The capacity of a register is exceeded.
- PARAMETER-An operand used by a program or subroutine.
- PARITY CHECK—A summation check in which the binary digits in a character are added and the sum checked against a previously computed parity digit; i.e., a check which tests whether the number of ones is odd or even.
- P REGISTER—The Program Address Counter (P register) is a one's complement additive register (modulus 2<sup>15</sup>-1) which defines the storage addresses containing the individual program steps.
- PROGRAM-A precise sequence of instructions that accomplishes the solution of a problem. Also called a routine.
- PSEUDO CODE A statement requesting a specific operation by the assembler or compiler.
- Q REGISTER-Auxiliary 24-bit arithmetic register which assists the A register in the more complicated arithmetic operations.
- RADIX The number of different digits that can occur in a digit position for a specific number system. It may be referred to as the base of a number system.
- RANDOM ACCESS Access to storage under conditions in which the next position from which information is to be obtained can be independent of the previous one.
- READ-To remove a quantity from a storage location.
- REGISTER-The internal logic used for temporary storage or for holding a quantity during computation.
- REJECT A signal generated under certain circumstances by either the external equipment or the processor during the execution of Input/Output instructions.

- REPLACE When used in the title of an instruction, the result of the execution of the instruction is stored in the location from which the initial operand was obtained. When replace is used in the description of an instruction, the contents of a location or register are substituted by the operand. The Replace operation implies clearing the register or portion of the register in preparation for the new quantity.
- REPLY-A response signal in I/O operations that indicates a positive response to some previous operation or request signal.
- **RETURN** JUMP An instruction that jumps from a sequence of instructions to initiate a second sequence and prepares for continuing the first sequence after the second is completed.
- ROUTINE-The sequence of operations which the computer performs, also called a program.
- SCALE FACTOR-One or more coefficients by which quantities are multiplied or divided so that they lie in a given range of magnitude.
- S REGISTER-The 13-bit S register displays the address of the word.
- SHIFT-To move the bits of a quantity right or left.
- SIGN BIT In registers where a quantity is treated as signed by use of one's complement notation, the bit in the highest order stage of the register. If the bit is "1", the quantity is negative; if the bit is "0", the quantity is positive.
- SIGN EXTENSION The duplication of the sign bit in the higher order stages of a register.

SOFTWARE – Programs and/or subroutines.

- SOURCE LANGUAGE The language used by the programmer to define his program.
- STAGE The FFs and inverters associated with a bit position of a register.
- STATUS-The state or condition of circuits within the processor, I/O channels, or external equipment.
- STORE To transmit information to a device from which the unaltered information can later be obtained. The Store operation is essentially the reverse of the Load operation. Storage location M is cleared, and the contents of the register are copied into M.
- SUBROUTINE A set of instructions that is used at more than one point in program operation.
- SYMBOLIC CODING-A system of abbreviation used in preparing information for input into a computer; e.g., Shift Q would be SHQ.
- TOGGLE To complement each specified bit of a quantity, i.e.: "1" to "0" or "0" to "1".
- TRANSMIT (Transfer) The term transfer implies register contents are moved; i.e., the contents of register 1 are copied into register 2. Unless specifically stated, the contents are not changed during transmission. The term transmit is often used synonymously with transfer.
- TWO'S COMPLEMENT -- Number that results from subtracting each bit of a number from "0". The two's complement may be formed by complementing each bit of the given number and then adding one to the result, performing the required carries.
- UNDERFLOW An illegal change of sign from to +, e.g., subtracting from a quantity such that the result would be less than  $-(2^{n}-1)$ , where n is the modulus. In floating point notation, this occurs where the value of the exponent becomes less than  $2^{.10} + 1$  (-17778).

WORD-The content of a storage location. It can be an instruction or 24 bits of data. WRITE-To enter a quantity into a storage location.

- X REGISTER-An arithmetic transfer register. Nonaddressable and nondisplayed.
- Z REGISTER A 28-bit storage data register. Receives the data and parity bits as they are read from storage or written into storage. Nonaddressable but displayed on the 'T' panel in the storage module.

FORM CA23I REV.I-67

This form is not intended to be used as an order blank. Your evaluation of this manual will be welcomed by Control Data Corporation. Any errors, suggested additions or deletions, or general comments may be made below. Please include page number references and fill in publication revision level as shown by the last entry on the Record of Revision page at the front of the manual. Customer engineers are urged to use the TAR.

#### **3100 CHARACTERISTICS**

- Stored-program, solid-state, general-purpose computer.
- Diode logic.
- Parallel mode of operation.
- Single address logic.
- Programmed inter-register transfers.
- Address modification (indexing).
- Indirect addressing.
- Character and word addressing (4 characters per word).
- 28-bit storage word (24 data bits and 4 parity bits).
- Nonvolatile magnetic core storage. Standard memory: 4,096 words/16,384 characters.
- Selected storage protection.
- Storage sharing.

- Complete cycle time: 1.75 microseconds
- Access time: 1.0 microsecond.
- 24-bit accumulator register and auxiliary accumulator register.
- Binary arithmetic: 2<sup>24</sup>-1 modulus, one's complement for all single precision (24-bit) operations and double precision (48-bit) addition and subtraction.
- Instruction repertoire compatible with the 3200 and 3300 Computers.
- Trapped instruction processing: executes double precision multiplication and division, floating point, binary coded decimal (BCD) and an optional register transfer instruction if optional arithmetic logic is not present in a system.
- Integrated register file.
- Complete interrupt system.
- Block control operations.
- Logical and sensing operations.
- Masked storage searches.
- Three 15-bit index registers.
- Real-time clock (1.0 millisecond incrementation)
- Integrated upright console featuring:
  - Binary register displays.
  - Internal and external status displays.
  - Instruction step control.
  - Breakpoint thumbwheel control.
  - Auto step control.
  - Auto Load.
  - Auto Dump.
  - Detachable keyboard for manual entry and control of the computer.
  - Standard 3000 Series type 12-bit bidirectional data channel.
- Data transfer rate up to 3.3 megabits/second.
- Compatible I/O mediums include magnetic tape, disk file, punched cards, paper tape and printed forms.
- Options include:
  - Memory expansion to 8,192; 16,384 or 32,768 words.
  - 3 additional 12-bit data channels, or 1 additional 12-bit data channel and 1 24-bit data channel.
  - Floating point and 48-bit precision multiply and divide hardware logic.
  - BCD arithmetic hardware logic.
  - On-line I/O monitor typewriter.
  - Desk-sized console with octal and decimal displays, or
  - Desk-sized console equipped with nondetachable keyboard, binary displays and on-line electric typewriter.
  - Complete selection of peripheral equipment.
