C 0101          1.1   PROGRAM ABSTRACT
C 0102                ----------------
C 0103
C 0104                This program will functionally verify and exercise RQDX1
C 0105                Controller/Disk Drive subsystems. It is designed to verify
C 0106                that the subsystem is functioning correctly and operating
C 0107                within design specifications.

C 0186
C 0187
C 0188          In a machine  with more memory,  free space will ocuur
C 0189          between the exerciser and the DRS.
```

```
C 0190
C 0191
C 0192          2.0   OPERATING INSTRUCTIONS
C 0193                ----------------------
C 0194
C 0195
C 0196          This is a Rev C  Supervisor  Diagnostic:  for operating
C 0197          instructions,  please see chapter 5 of XXDP+ operator's
C 0198          manual.  They are no longer  included in the diagnostic
C 0199          because  it is desired  that a change in those instruc-
C 0200          tions not require a re-assembly of all Supervisor Diag-
C 0201          nostics.
C 0202
C 0203
C 0204          2.1   HARDWARE QUESTIONS
C 0205                ------------------
C 0206
C 0207          The  following series  of questions  comprise the para-
C 0208          meters necessary to identify each disk subsystem.
C 0209
C 0210
C 0211          Hardware Configuration Questions
C 0212          --------------------------------
C 0213
C 0214      The  program  will  ask  the  following  questions  in
C 0215      response to a START command (non-script).
C 0216
C 0217      1.  CHANGE HW (L) Y ?
C 0218
C 0219          Answe, NO to use the pre-built answers for all  hardware
C 0220          questions.   This  program will be released pre-built to
C 0221          test three unit with default answers  shown below.   The
C 0222          pre-built  answers  may  be changed at any time with the
C 0223          setup utility.  Answer YES if you want all the  hardware
C 0224          questions to be asked.
C 0225
C 0226      2.  NUMBER OF UNITS (D) ?
C 0227
C 0228          No default.  Answer with the number of  disk drive units
C 0229          to be exercised or tested.   This  answer will determine
C 0230          how  many  times  the  following questions are asked.  A
C 0231          range  of 1 to 4 units  may be specified.  A unit number
C 0232          will be assigned  sequentially from 0  by the Diagnostic
C 0233          supervisor for each unit.
C 0234
C 0235      3.  IP ADDRESS (O) 172150 ?
C 0236
C 0237          Enter the address of the IP register of one RQDX1 as ad-
C 0238          dressed  by  the processor with memory management turned
C 0239          off.  The program expects an even 16-bit address  in  the
C 0240          range of 160000 to 177774.  172150 is the default.
```

```
C 0241
C 0242
C 0243          4.  VECTOR ADDRESS (O) 154 ?
C 0244
C 0245              Answer  with the  interrupt vector of same  RQDX1 in  the
C 0246              above  question.   A vector  address in the range of 4 to
C 0247              774 may be specified.  154 is the default.
C 0248
C 0249          5.  BR LEVEL (D) 4 ?
C 0250
C 0251              Answer with the bus request interrupt level used by  the
C 0252              above RQDX1. Levels 4 through 7 are acceptable. 4 is the
C 0253              default.
C 0254
C 0255          6.  RQDX1 DRIVE NUMBER (D) 0 ?
C 0256
C 0257              Enter the  logical unit  number for one drive associated
C 0258              with the  IP address  above.  Drive  numbers are  in the
C 0259              range  of 0  through 3.  The  number  entered  here must
C 0260              match the unit plug on the front panel of the device.  0
C 0261              is the default answer.
C 0262
C 0263          7.  ENTER UNIT TYPE:  RD51 - YES  OR  RX50 - NO ?
C 0264
C 0265              Question  will  be  asked to  determine the type of disk
C 0266              that this particular unit is; either RD51, or RX50.  The
C 0267              software will  not check for the correctness of the con-
C 0268              figuration  as indicated by the answers to the UNIT TYPE
C 0269              question.
C 0270
C 0271          8.  ALSO EXERCISE DIAGNOSTIC AREA (-NON-CUSTOMER AREA) ?
C 0272
C 0273              A "Yes" answer to this question will turn on the DUP
C 0274              (Diagnostic/Utilities Protocol) Exerciser.  The DUP Ex-
C 0275              erciser will read the DBNs (Diagnostic Blocks) in a
C 0276              sequential order from 0 to octal (217). DBNs can only
C 0277              be accessed throw DUP protocol making the blocks unreach-
C 0278              able throw normal customer use.  The DUP Exerciser is
C 0279              contained in the middle of the MSCP (Mass Storage Control
C 0280              Protocol) Exerciser which reads LBNs (Logical blocks).
C 0281              So physically a large amount of LBNs will be READ and/or
C 0282              WRITTEN then the DUP Exerciser will turn on and READ
C 0283              and/or WRITE a few DBNs. The DUP Exerciser will then
C 0284              reinitialize the controller so the MSCP Exerciser can
C 0285              continue where it left off. The processes of reinitial-
C 0286              izing takes a few seconds.
C 0287
C 0288          9.  WRITE ON DIAGNOSTIC AREA?
C 0289
C 0290              A "yes" answer to this statement will allow the DUP Ex-
C 0291              erciser to WRITE/READ and compare the DBNs (Diagnostic
C 0292              Blocks).  Where a "NO" answer will allow the program to
C 0293              READ only the DBNs.
```

```
;       C 0294
;       C 0295                  NOTE  **  IF yes ANSWER, DATA ON DBNs WILL BE DESTROYED.
```

```
C 0296
C 0297
C 0298          10.  STARTING LBN (D) 0 ?
C 0299
C 0300              Enter the starting logical block number of the  customer
C 0301              data area that you are going to test. LBNs  range from 0
C 0302              to  21599  (RD51),  or  0 to 799  (RX50),  with 0 as the
C 0303              default.
C 0304
C 0305           11.  ENDING LBN (MAX - RX50: 799, RD51: 21599) (D) 21599 ?
C 0306
C 0307              Answer this  question for the last customer LBN you wish
C 0308              to test.  LBNs range from 0 to 21599 (RD51), or 0 to 799
C 0309              (RX50), with 21599 (or 799) as the default.
C 0310
C 0311              NOTE: The two previous  questions are generally Software
C 0312                    Parameter questions,  but since two different disk
C 0313                    devices exist on the RQDX1 subsystem, this becomes
C 0314                    a unit by unit question. It is possible to specify
C 0315                    an  LBN which  is too large  since we  are dealing
C 0316                    with different devices. The program will check for
C 0317                    block number bounds and if they are exceeded, will
C 0318                    assign the maximum bound for that device.
C 0319
C 0320
C 0321           12.  EXERCISE ON CUSTOMER DATA AREA ON THIS DISK UNIT (L) ?
C 0322
C 0323              Answering YES will destroy any customer data that is  on
C 0324              the  disk; therefore, the following warning message will
C 0325              appear, followed by a confirmation prompt:
C 0326
C 0327              ** WARNING - CUSTOMER DATA AREA WILL BE OVERWRITTEN! ...
C 0328               CONFIRM (L) ?
C 0329
C 0330              This question will default to NO if the operator has de-
C 0331              cided  to  bypass  the  hardware  questions.  Otherwise,
C 0332              there is no default.
```

2.2 SOFTWARE QUESTIONS

Software Parameter Questions

The program will ask the following questions in response to the START, RESTART, and CONTINUE commands.

1. CHANGE SW (L) Y ?

   Answer NO to bypass the following questions in this section. This question should normally be answered NO when the Exerciser is first run. A NO answer will cause the Exerciser to select the default parameters shown with each question below. Then, depending on the errors detected, it may be desirable to change this answer to YES to alter the test parameters and further isolate the problem.

2. HARD ERROR LIMIT (D) 32 ?

   Enter the number of hard errors allowed before a unit is dropped from testing. A number in the range of 1 to 65535 will be accepted.

3. TRANSFER LIMIT IN MEGABYTES (0 FOR QUICK PASS) (D) 0 ?

   When the specified number of bytes have been transferred to/from a unit, the unit will be dropped from testing. When all units are dropped, an end-of-pass will be indicated. This is the method used to determine how long the Exerciser is to run.

   The only other way the Exerciser will declare end-of-pass is if all units are dropped because the error limit on each is exceeded. However, the operator can always abort the program at any time by typing CONTROL-C.

4. PERCENTAGE OF RD51 OPERATIONS OUT OF TOTAL OPERATONS (D) 99 ?

   In order to maintain typical usage for the devices of this exercise, a certain percentage of operations must be directed to the RD51s (the rest go to the RX50s). It turns out that this percentage is very high (as indicated by the 99% figure given as the default). It may be desirable in some cases to direct more activity to the RX50s. This is easily done by directing a smaller percentage of the operations to the RD51s. The numbers associated with usage are adjusted internally by the program according to device type and percentage.

```
C 0386
C 0387
C 0388          5.  NUMBER OF DBNs READ AT ONE TIME (18) ?
C 0389
C 0390              This variable adjusts the amount of DBNs read in one pass
C 0391              of the DUP Exerciser.  The DUP Exerciser has to reinit
C 0392              the controller every time it goes back into the MSCP Exer-
C 0393              ciser.  This Hard reinitialization takes a few seconds.
C 0394              The ratio of LBN tranfers to DBN tranfers DOESN'T change
C 0395              only the amount of DBNs read on one pass.  So the higher
C 0396              this number the less reinitializing the program does and
C 0397              the less time to run. The lower this number the more
C 0398              reinitializations the longer amount of time to tranfer the
C 0399              same amount LBNs and DBNs.
C 0400
C 0401          6.  CLEAR STATISTICAL TABLES AFTER PRINTING (L) N ?
C 0402
C 0403              Answering YES causes the statistical fields to be clear-
C 0404              ed to zero after the report is printed (either at end of
C 0405              pass,  or at  operator  request).  Otherwise, cumulative
C 0406              totals are maintained.
C 0407
C 0408          7.  RANDOM SEEK MODE (L) Y ?
C 0409
C 0410              Answer YES to cause block numbers to be chosen randomly.
C 0411              Answer  NO to cause block numbers to be selected sequen-
C 0412              tially.
C 0413
C 0414          8.  UNITS TO BE SELCTED AT RANDOM (NO, IMPLIES SEQUENTIAL) (L) N ?
C 0415
C 0416              This  question is  optionally asked if the answer to the
C 0417              previous  question is N[o].  The  selection of units for
C 0418              sequential  operations is affected by the answer to this
C 0419              question.  If the default  answer is chosen (N[o]), then
C 0420              units  shall be  selected in a  predetermined manner  in
C 0421              accordance  with the typical  seek time margins for each
C 0422              device. If the alternate answer is chosen (Y[es]),  then
C 0423              the  units will be chosen  at random  in accordance with
C 0424              the percentages specified in Software question 4.
C 0425
```

```
C 0426
C 0427
C 0428          9.  READ-COMPARES PERFORMED AT THE CONTROLLER (L) N ?
C 0429
C 0430              Answering YES causes all read commands to include the
C 0431          "compare" modifier.  This essentially forces the con-
C 0432          troller to perform two read operations on the same disk
C 0433          address, and to compare the results.
C 0434
C 0435              The following message will appear after the operator has
C 0436          answered this question:     —
C 0437
C 0438              THE REMAINING QUESTIONS ONLY APPLY TO UNPROTECTED DISK UNITS.
C 0439
C 0440          10.  WRITE-COMPARES PERFORMED AT THE CONTROLLER (L) N ?
C 0441
C 0442              Answering YES causes all write I/O requests to be
C 0443          changed to write-compare.  After each write, the con-
C 0444          troller will read the data and compare it to data
C 0445          re-obtained from the host.
C 0446
C 0447          11.  CHECK ALL WRITES AT HOST BY READING (L) N ?
C 0448
C 0449              This question will only be asked if the previous ques-
C 0450          tion was answered NO.  Answering YES causes all writes
C 0451          to be checked by the host by reading the data immediate-
C 0452          ly after the write operation.  This option consumes
C 0453          extra CPU time, and doubles the amount of storage re-
C 0454          quired for writes.  Therefore, it is only recommended
C 0455          when device write-compare operations are suspect.
C 0456
C 0457
C 0458          12. USER-DEFINED DATA PATTERN (L) N ?
C 0459
C 0460              An answer of YES allows the operator to define his/her
C 0461          own data pattern to be used in all write operations.  A
C 0462          NO answer will allow the operator to select a
C 0463          pre-defined data pattern in the next question.
C 0464
C 0465          13. SELECT PRE-DEFINED DATA PATTERN (0 FOR SEQUENTIAL SELEC-
C 0466          TION) (D) 0 ?
C 0467
C 0468              There are 21 predefined data patterns available, select-
C 0469          ed as 1 to 21 (see section 4.9).  A zero answer will
C 0470          cause patterns 1 to 21 to be sequentially selected for
C 0471          each write.  (Note that pattern 1 consists entirely of
C 0472          random numbers).
C 0473
```

```
;       C 0474
;       C 0475
;       C 0476              14. NUMBER OF WORDS IN DATA PATTERN (16 MAXIMUM)  (D)  16  ?
;       C 0477                  PATTERN VALUES (O) ?
;       C 0478
;       C 0479                  These questions will only be asked if the  operator  has
;       C 0480                  decided  to define his/her own data pattern.  The actual
;       C 0481                  bit patterns will be entered as octal (PDP-11).
```

```
C 0482
C 0483
C 0484          3.0   ERROR TYPES
C 0485                ----------
C 0486
C 0487          This program has four types of error  classifications;
C 0488          system fatal, device fatal, hard and soft.
C 0489
C 0490          SYSTEM FATAL ERRORS
C 0491          ------------------
C 0492
C 0493          System fatal errors are used to indicate that an error
C 0494          was detected by the  Diagnostic Supervisor in relation
C 0495          to loading/controlling the diagnostic process.
C 0496
C 0497          The content  of each  error is  such that it should be
C 0498          self explanatory.  However,  the messages utilize some
C 0499          terms that are specific to the disk subsystem, and may
C 0500          require some getting use to.
C 0501
C 0502
C 0503          DEVICE FATAL ERRORS
C 0504          ------------------
C 0505
C 0506          Device fatal errors are a result of:
C 0507
C 0508          an error that is  considered fatal to the device,  but
C 0509          testing will continue.
C 0510
C 0511
C 0512          HARD ERRORS
C 0513          ----------
C 0514
C 0515          Hard errors are a result of:
C 0516
C 0517                  1.  retries of a soft error or *
C 0518                  2.  a non-recoverable error
C 0519                  3.  a soft error if retrys are not set.
C 0520
C 0521                  *  Note: Retries are executed in the controller
C 0522
C 0523          SOFT ERRORS
C 0524          ----------
C 0525
C 0526          Soft errors  are media related errors.  All soft errors
C 0527          will be retried by the controller.
C 0528
C 0529          Note: Soft errors are retrieved from the controller via
C 0530          the error log  capabilities of  MSCP.
```

```
C 0531
C 0532
C 0533          3.1     ERROR INFORMATION
C 0534          ----------------
C 0535
C 0536      All general error messages will include the type of error
C 0537      (system-fatal, device-fatal, hard, soft) and a unit number.
C 0538      If the error applies to a controller, then only the first
C 0539      unit number of the controller will be given. (The user will
C 0540      know the other unit numbers when subsequent "drop unit"
C 0541      messages are printed).
C 0542
C 0543          Basic error messages provide more details about the
C 0544      error. The Exerciser will print all basic error messages,
C 0545      along with the disk address, if applicable. In some
C 0546      cases where a device-fatal error applies to a controller,
C 0547      the controller's IP address will be printed.
C 0548
C 0549          Extended error messages will be used to print the
C 0550      relevant fields of command and end message packets, status
C 0551      codes, SA register contents, and error log messages. All
C 0552      values will be in octal (PDP-11).
C 0553
C 0554          The error messages in this section do not include
C 0555      errors detected and printed by the Diagnostic Supervisor.
C 0556
C 0557
C 0558
C 0559          3.2 INITIALIZATION ERRORS
C 0560              --------------------
C 0561
C 0562          Two kinds of errors will be reported to the operator
C 0563      during the Initialization Test. The System-fatal error is -
C 0564      too many units specified. A system-fatal error will cause
C 0565      the Exerciser to abort.
C 0566
C 0567          Device-fatal errors only affect the unit(s) involved.
C 0568      Testing will continue on all other units. This class of
C 0569      errors includes, but is not limited to, the following:
C 0570
C 0571              1. Register Existence Test failure (no device present)
C 0572
C 0573              2. Vector Test failure
C 0574
C 0575              3. BR Level Test failure
C 0576
C 0577              4. Initialization sequence failure
C 0578
C 0579              5. Online failed
C 0580
C 0581              6. Access failed
```

C 0582
C 0583
C 0584 ## 3.3 EXERCISER ERRORS
C 0585
C 0586
C 0587 Most errors reported during this test will originate
C 0588 from MSCP end message packets. The status code field will
C 0589 be converted to text and printed as part of a basic error
C 0590 message. Any subcode value will follow if extended error
C 0591 messages are enabled.
C 0592
C 0593 The following list represents some of the error conditions
C 0594 reported via MSCP:
C 0595
C 0596
C 0597 1. Disk unit went offline (a sub-code may follow
C 0598 detailing the reason)
C 0599
C 0600 2. Compare error
C 0601
C 0602 3. Data error (a sub-code may follow)
C 0603
C 0604 4. Drive error (a sub-code may follow)
C 0605
C 0606 5. Host buffer access error
C 0607
C 0608 6. Media format error (a sub-code may follow)
C 0609
C 0610
C 0611
C 0612
C 0613
C 0614 ## 3.4 ERROR LOG MESSAGES
C 0615
C 0616
C 0617 The contents of the error-log messages received from the
C 0618 controller are printed as received, and should be deciphered
C 0619 using the MSCP specs.
C 0620
C 0621
C 0622 ## 3.5 MSCP ERRORS
C 0623
C 0624
C 0625 An MSCP error occurs when the host receives an Invalid
C 0626 Command End Message from the RQDX1. In such cases, the host
C 0627 will print out the erroneous command followed by the reason
C 0628 for the error. If extended printouts are enabled, then the
C 0629 entire contents of the end message will be displayed in octal
C 0630 without interpretation of the data.

```
C 0631
C 0632
C 0633          3.6   SAMPLE MSCP ERROR STATEMENT
C 0634                ---------------------------
C 0635
C 0636
C 0637                The errors listed by the exerciser are ussually very des-
C 0638          criptive and  are self explanatory.  The  following is an example
C 0639          error  statement.  This  error  statement  is  the extented error
C 0640          message.,
C 0641
C 0642
C 0643          (example)                          (comments)
C 0644
C 0645          * DISK: XXX                        !DISK UNIT NUMBER
C 0646          CRN: XXXXX                         !CONTROLLER PACKET NUMBER
C 0647          MESSAGE TYPE: - SEQUENTIAL         !THIS IS THE PORT MESSAGE TYPE
C 0648          COMMAND:-MSCP-READ-COMPARE         !CONNECTION ID AND COMMAND AND MODIFIER GIVEN TO DRIVE
C 0649          STATUS CODE:  UNIT OFFLINE         ! STATUS CODE OF COMMAND
C 0650          STATUS SUB-CODE:  NO VOLUME MOUNTED OR DRIVE DISABLED BY SW'TCH ! SUB CODE
C 0651          BYTE COUNT IN COMMAND XXXXX        !NUMBER OF BYTES WANTED TO READ
C 0652          ACTUAL # OF BYTES TRANSFERED XXXXX !NUMBER OF BYTES ACTUALLY READ
C 0653          I/O BUFFER ADDRESS (32 BITS)      XXXXXX XXXXXX
C 0654          LBN: XXX                           ! LBN WANTED TO READ
C 0655          END MESSAGE FLAGS:                 ! THERE ARE NO END FLAGS FOR THIS ERROR
C 0656
C 0657
C 0658
C 0659                The  status  code in  an end  messages is  broken into two
C 0660          pieces. The first 5 bits represent the major status which is given
C 0661          by the "invalid command" message.  The 11 remaining bits represent
C 0662          the sub-code,  which tells in greater detail the error in the con-
C 0663          troller.  The LBN is the logical  block on the disk the controller
C 0664          was trying to read.  The byte count refers  to the number of bytes
C 0665          the controller was going to read off the LBN. The actual number of
C 0666          bytes  transfered refers  to the  number of bytes  read before the
C 0667          error.  The end message flags give any flags that might have been
C 0668          set by the controller. It is pretty apparent that this error was
C 0669          caused by something physically switching the disk offline.
C 0670
C 0671
C 0672          3.7   DUP ERRORS
C 0673                ----------
C 0674
C 0675                A DUP error occurs when the host receives an  Invalid
C 0676          Command End Message from the RQDX1.  In such cases, the host
C 0677          will print out the erroneous command followed by the  reason
C 0678          for the error.
C 0679                There are two major places where errors in  DUP will
C 0680          occur. The first being in the status code much the same as MSCP,
C 0681          and the second in the DUP I/O Buffer. Using the DUP sub-protocol
C 0682          (using Receive/Send commands to communicate with controller local
C 0683          programs (p. 25 of DUP.V05)) the controller may send an error
```

```
;       C 0684          message to the host by writting in the DUP I/O Buffer.
```

```
C 0685
C 0686
C 0687          3.8   SAMPLE DUP ERROR STATEMENT
C 0688                ----------------------------
C 0689
C 0690
C 0691                The errors listed by the exerciser are ussually very des-
C 0692          criptive and  are self explanatory.  The  following is an example
C 0693          error  statement.  This  error  statement  is  the extented error
C 0694          message.

C 0712          DBN: XXX
C 0713
C 0714                The DUP Error messages are almost like the MSCP messages
C 0715          but they contain an extra three classifications.  These are the
C 0716          MESSAGE TYPE, MESSAGE NUMBER, MESSAGE ERROR CODE.  These are part
C 0717          of a DUP sub-protocal for communicating with a controller local
C 0718          program.  The I/O buffer address contains the address of the DUP
C 0719          I/O Buffer which contains the MESSAGE information.
C 0720                The  status  code in  this end  message is succesful which
C 0721          means the controller was OK but it did not understand the host
C 0722          message or something on the host side caused the controller to error
C 0723          while running the controller local program.  This error was produced
C 0724          by an ILLEGAL UNIT NUMBER.  The disk went off line.
C 0725

C 0726
C 0727
C 0728          4.0   PERFORMANCE AND PROGRESS REPORTS
C 0729                ----------------------------------
C 0730
C 0731
C 0732              A summary report is printed at the end of  each  pass of
C 0733          the  Exerciser or upon demand by the operator. The fields may
C 0734          be cleared to zero after the  report is printed  depending on
C 0735          the operator's  response to this option in the software ques-
C 0736          tions. Any units added to the test cycle will also begin with
C 0737          cleared statistics.
C 0738              There are two basic listings one for LBNs and one for
C 0739          DBNs.  The DBN listing will only contain RD51s for the simple
C 0740          reason that they contain DBNs and RX50s do not.  The DBNs
C 0741          are READ and WRITTEN by blocks instead of by bytes. All units
C 0742          contain LBNs. The errors for each unit will be listed next to
C 0743          the LBNs.
C 0744              Errors are grouped into two  basic catagories:  hard and
C 0745          soft.  Each is sub divided into four more catagories, depend-
C 0746          ing on the most probable classification for that error.
C 0747
C 0748              The sub catagories are:
C 0749
C 0750          1. disk related errors
C 0751
C 0752          2. seek (or format) related errors
C 0753
C 0754          3. controller or drive related errors
C 0755
C 0756          4. host (the CPU) related errors.
C 0757
C 0758               All numeric values are in decimal radix.

C 0773
C 0774
C 0775          5.0  TEST SUMMARY
C 0776               ------------
C 0777
C 0778          The RQDX1 functional tester and exerciser consists of
C 0779     two parts, the initialization subtest and the performance
C 0780     exerciser. The operator is not able to select which of these
C 0781     two parts he/she wishes to run; they both must be executed.
C 0782
C 0783          5.1  INITIALIZATION SUBTEST
C 0784               ----------------------
C 0785
C 0786          The purpose of this subtest is to verify the hardware
C 0787     configuration as specified by the operator, and to bring each
C 0788     unit online. The Initialization Subtest will always precede
C 0789     the execution of any other test.
C 0790
C 0791          First, the presence of each device register will be ve-
C 0792     rified, along with a check on the BR level specified by the
C 0793     operator. Then, an initialization will be issued to each
C 0794     controller configured for testing. When the initialization
C 0795     sequence has been completed, an attempt will be made to bring
C 0796     each unit online. If this succeeds, one or two MSCP reads
C 0797     will be issued to the inner-most LBN of each selected disk to
C 0798     to ensure that each disk drive can seek and be read.
C 0799
C 0800          Any device-fatal or hard errors encountered during this
C 0801     test will cause the appropriate unit(s) to be dropped. If
C 0802     basic error messages are enabled, then the program will print
C 0803     out the specific reason for dropping the unit(s). Henceforth,
C 0804     the failed unit(s) will not be tested unless the operator
C 0805     intervenes (adds unit(s) or restarts Exerciser).
C 0806
C 0807          Upon succesful completion of the Initialization Subtest,
C 0808     the program will begin executing the Exerciser.
C 0809
C 0810     5.2  EXERCISER
C 0811          ---------
C 0812
C 0813          The purpose of this subtest is to exercise the disk drives
C 0814     in a manner similar to the typical usage under standard oper-
C 0815     ating systems. Execution of this test should give an indica-
C 0816     tion of the operating performance of the disk drive subunits.
C 0817     This test will utilitize random disk addresses, random word
C 0818     counts, and data patterns, all subject to the limits and
C 0819     specifications made by the operator. All protected disks will
C 0820     be subject to read-only operations, while unprotected disks
C 0821     may be read or written, depending on the answers given to the
C 0822     software parameter questions. End-of-pass will be declared
C 0823     when the specified number of bytes have been transferred for
C 0824     all the disks taken as a whole.
```

```
C 0825
C 0826
C 0827                  If a read/write error occurs during this test, then the
C 0828              RQDX1 CONTROLLER will initiate an appropriate number of re-
C 0829              tries. If all retries fail, then a hard error will be repor-
C 0830              ted to the host, an error message will be diplayed on the
C 0831              console terminal and the error will be tallied for the sum-
C 0832              mary report. The unit will be dropped if the hard error count
C 0833              has exceeded the specified limit.
C 0834
C 0835                  The Exerciser is actually two exercisers combined together.
C 0836              The main MSCP exerciser writes and reads LBNs while the less
C 0837              used DUP exerciser writes and reads DBNs. The DUP exerciser is
C 0838              used once per 25 LBN transfers or alot less than the MSCP
C 0839              exerciser. The two Exercisers use a some what different
C 0840              protocol to tranfer I/O. It is possible to go from MSCP
C 0841              protocol to DUP protocol without reinitializing the controller
C 0842              but impossible to go from DUP to MSCP protocol. Therfore after
C 0843              the DUP Exercise pass the controller is reinitialize and control
C 0844              given back to the MSCP Exerciser. The reinitialization process
C 0845              takes a few seconds. For this reason a variable is placed in
C 0846              the DUP Exerciser to allow it to transfer more than 1 DBN per pass.
C 0847              The variable,"X", is multiplied by 25 to give the amount of MSCP
C 0848              transfers before the DUP Exerciser can tranfer "X" amount of DBNs.
C 0849              The higher the variable the less reinits the controller must do.
C 0850
C 0851
C 0852          5.3 DROP UNIT SUMMARY
C 0853              ----------------
C 0854
C 0855                  During the Initialization Subtest, individual units will
C 0856              be dropped from the test sequence if they are unable to be
C 0857              brought online or the operator specified device does not match
C 0858              the hardware.
C 0859
C 0860                  During the Exercise, the program will drop a unit for one
C 0861              of three reasons. The normal path is for each unit to complete
C 0862              the transfer of N megabytes, where N is specified by the oper-
C 0863              ator during SW questioning and be soft-dropped. Otherwise, a
C 0864              unit will be hard-dropped if the number of hard errors encoun-
C 0865              tered exceeds the operator-specified limit, or if a fatal error
C 0866              is detected. Units hard-dropped may later be added to the test
C 0867              cycle. However, statistics for the hard-added unit will be
C 0868              cleared to zero; if a transfer limit was specified, in which
C 0869              case the unit was soft-dropped, the statistics may or may not
C 0870              be cleared depending on the operators answer to Software
C 0871              question 12.
```

;         3319  routine QIO_FUNC : novalue =
;         3320
;         3321  !+
;         3322  !       THIS ROUTINE IS CALLED BY QIO_GEN TO SELECT THE I/O FUNCTION (OPCODE)
;         3323  !       TO BE USED FOR THE CURRENT QIO OR QIO PAIR. THE FUNCTION IS DETERMINED
;         3324  !       BY THE FOLLWING ALGORITHM:
;         3325  !
;         3326  !               IF THE CHOSEN UNIT IS PROTECTED
;         3327  !               THEN
;         3328  !                       FUNCTION = READ
;         3329  !               ELSE (UNPROTECTED)
;         3330  !                       FUNCTION (WRITE OR READ) IS BASED ON A RANDOM
;         3331  !                       NUMBER
;         3332  !
;         3333  !       IN ADDITION, IF THE OPERATOR SELECTED THE OPTION OF PERFORMING WRITE-
;         3334  !       COMPARES AT THE HOST, AND IF A "WRITE" FUNCTION WAS CHOSEN ABOVE FOR
;         3335  !       THE FIRST QIO, THEN A "READ" OPCODE IS LOADED INTO THE SECOND MSCP
;         3336  !       ENVELOPE. OTHERWISE, THE SECOND MSCP ENVELOPE IS RETURNED TO THE POOL.
;         3337  !
;         3338  !       THIS ROUTINE ALSO DECIDES WHEATHER IT IS TIME TO RUN THE DUP EXERCISER.
;         3339  !       THE EXERCISER WRITES 25 LBNS FOR EVERY 1 DBN. FOR INITIALIZATION
;         3340  !       REASONS THE MULTIPLE OF 25 LBNS CAN BE READ FOR 1 * MULTIPLE OF DBNS.
;         3341  !       DUP EXERCISER WRITES X BLOCKS PER PASS THRU THE DUP ROUTINE.  THERFORE
;         3342  !       THE RATIO OF 1 TO 25 MUST BE MULTIPLIED BY  X FOR A RATIO OF 1 TO
;         3343  !       25 * X.  SO EVERY 25*X LBN'S READ OFF A WINCHESTER UNIT X  DBN'S WILL
;         3344  !       BE READ IF ASKED BY THE USER.  X is represented by the VARIABLE "DUPROUND".
;         3345  !       DUPROUND MAY BE CHANGED IN THE SOFTWARE QUESTION GIVEN AT THE START OF
;         3346  !       RUNNING THE EXERCISER PROGARM.  THE DUP EXERCISER THEN REINITIALIZES
;         3347  !       THE CONTROLLER AND CONTINUES AS IF THE REGULAR MSCP EXERCISER WAS
;         3348  !       NEVER INTERRUPTED.  NOTE THAT THE REINITIALIZATION PROCESSES TAKES
;         3349  !       A COUPLE OF SECONDS WHICH ONCE ADDED UP AFTER A COUPLE MILLION READS
;         3350  !       CAN PROVE TO BE QUITE TIMELY.  THERFORE I SUGGEST THAT IF A LARGE AMOUNT OF
;         3351  !       I/O TRANFERS ARE TO BE DONE THE "DUPROUND" VARIABLE BE RAISED TO SPEED UP
;         3352  !       UP THE PROCESS.
;         3353  !
;         3354  !       IMPLICIT INPUTS:
;         3355  !               CST_ADDR - ADDRESS OF CURRENT CONTROLLER'S CST
;         3356  !               CUOFF - CURRENT UNIT CST OFFSET
;         3357  !
;         3358  !       IMPLICIT OUTPUTS:
