## PREFACE

## INTENDED READER

This guide assumes you are an application programmer.
The information in this guide describes escape sequences and codes used by the Rainbow l00's terminal emulation.

## GUIDE ORGANIZATION

## CHAPTER 1

## TRANSMITTED CHARACTERS

## INTRODUCTION

This chapter describes the characters generated by the Rainbow 100 keyboard. The keys are divided into four groups: standard keys, editing and cursor keys, function keys, and numeric keypad keys.

A distinction is also made between console mode and terminal mode on the Rainbow 100 computer.

## STANDARD KEYS

The keyboard generates American Standard Code for Information Interchange (ASCII) characters. The standard keys (Figure l) generate lowercase ASCII characters when neither Shift nor Lock is down. These keys generate uppercase ASCII characters when either Shift or Lock is down. Lock does not affect the nonalphabetic keys.

Figure 1: Standard Key Codes

| Remove | ESC | [ | 3 |
| Select | ESC | [ | 4 |
| Prev Screen | ESC | [ | 5 |
| Next Screen | ESC | [ | 6 |
| Up Arrow | ESC | [ | A |
| Down Arrow | ESC | [ | B |
| Right Ar row | ESC | [ | C |
| Left Arrow | ESC | [ | D |

## Cursor Control Keys

In ANSI mode the cursor keys generate either application or cursor control sequences. Cursor key mode selects the type of sequence.

The cursor keys generate ANSI cursor commands. The computer selects both cursor key mode and keypad mode. See Cursor Key Character Selection in Chapter 2 for more information.

In VT52 mode, the cursor keys only generate VT52 cursor control sequences. Table 2 lists the ANSI and VT52 compatible cursor key characters.

Table 2: Cursor Control Key Codes

## Control Character Keys

Table 3 lists the control characters generated by the keyboard. You can generate control characters in two ways.

- Hold down Ctrl and press any key in Table 3 under the Key Pressed column.
- Press any key in Table 3 under the Dedicated Key column. These dedicated keys generate control characters without the use of Ctrl.

Different computer systems may use each control character differently.

NOTE
The Rainbow 100 computer generates some control characters differently than previous DIGITAL terminals. Table 4 lists the changes.

Table 3: Control Codes Generated

| Control Code | VTl02 | Previous Terminals Rainbow 100 Computer |  |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
| NUL (octal 000) | Ctrl Space Bar | Ctrl @ | Ctrl Space Bar |
| RS (octal 036) | Ctrl | Ctrl | Ctrl Shift |
| US (octal 037) | Ctrl ? | Ctrl - | Ctrl Shift ? |
| ESC | Ctrl [, |  | Ctrl Unshifted [ |
| FS | Ctrl / |  | Ctrl Unshifted / |
| GS | Ctrl ] |  | Ctrl Unshifted ] |

## FUNCTION KEYS

The function keys (Figure 3) generate characters used by the computer software or communication system. The following paragraphs describe the function keys.

## Break

In terminal mode this key generates a break defined by the computer system when the break enable feature is on. This feature does not affect other key sequences using Break.

Hold down Shift and press Break to generate a long break disconnect. A long break disconnect usually disconnects the terminal from the communication line.

Hold down Ctrl and press Break to transmit the answerback message. In console node this key is not functional.

Figure 3: Function Keys

## NUMERIC KEYPAD REYS

These keys generate characters selected by the ANSI/VT52 feature and alternate (application) keypad mode. The computer selects application keypad mode. See Keypad Character Selection in Chapter 2 for more information.

In numeric keypad mode, the numeric keypad generates the numeric, comma, period, and minus sign characters used by the main keyboard. In application keypad mode, the numeric keypad generates escape sequences. Table 6 lists the characters generated by the numeric keypad.

Table 6: Keypad Codes

| Key | Numeric <br> Keypad Mode | Mode |  |  | VT52 Mode |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 6 (Cont.): Keypad Codes

CHAPTER 2

## RECEIVED CHARACTER PROCESSING

## GENERAL

This chapter describes how the Rainbow 100 computer processes received characters. There are two types of received characters, display characters and control functions. The chapter covers all display characters and control functions used by the Rainbow 100 computer.

## RECEIVED CHARACTERS

The Rainbow 100 computer processes characters according to American National Standards Institute (ANSI) standards X3.64-1979, X3.4-1977, and X3.41-1974. ANSI standard X3.4 defines the American Standard Code for Information Interchange (ASCII). Table 7 shows each ASCII character with its binary, octal, decimal, and hexadecimal values. ASCII corresponds to the International Standards Organization (ISO) Standard 646 and International Telegraph and Telephone Consultive Committee (CCITT) Alphabet 5.

The Rainbow 100 computer processes a received character based on character types defined by ANSI. Position in the ASCII table tells you whether a character is a control function or display character. The ASCII table is 8 columns wide and 16 rows long. The control functions are in columns 0 and 1 . The display characters are in columns 2 through 7. In addition to the characters shown in Table 7, the Rainbow 100 computer displays the 8-bit character shown in Table 8.

## CONSOLE MODE TABLES

In terminal mode, however, it depends on the communication port's configurations. In order to correctly process the 8-bit characters in Table 8, you must have the communication port parameter set to 8 data bits. If it is set to 7 data bits the high order bit is set to zero and the character is processed as though in Table 7.

Table 7: 7-bit US/UK ASCII Characters

|  | column | 0 |  | 1 |  | 2 |  | 3 |  | 4 |  | 5 |  | 6 |  | 7 |  |

KEY

Display characters are received characters displayed on the screen. The actual character displayed depends on the character set selected. You select the character set by using control functions. See Character Sets and Selection in this chapter for more information.

## CONTROL CHARACTERS

These single-character control functions start, modify, or stop terminal operations; the control functions are not displayed. Table 9 defines the control characters recognized by the terminal. All other control characters are ignored.

Each control character in this chapter has a mnemonic, listed in Table 9. The mnemonic is an abbreviation of the control character name.

Table 9: Control Characters Recognized by Rainbow 100 Computer

| Character | Mnemonic | Octal Code | Function |
| :---: | :---: | :---: | :---: |
| Null | NUL | 000 | Ignored when received (not stored in input buffer) and used as a fill character |
| Enquire | ENQ | 005 | Transmits answerback message |
| Bell | BEL | 007 | Generates bell tone. |
| Backspace | BS | 010 | Moves cursor to the left one character position; if cursor is at left margin, no action occurs. |
| Horizontal tab | HT | 011 | Moves cursor to next tab stop, or to right margin if there are no more tab stops. |
| Line Feed | LF | 012 | Causes a line feed or a new operation. (See Line Feed/New Line). Also causes printing in terminal mode only if auto print operation is selected. |
| Vertical tab | VT | 013 | Processed as LF. |
| Form feed | FF | 014 | Processed as LF. |
| Carriage return | CR | 015 | Moves cursor to left margin on current line. |
| Shift out | SO | 016 | Selects Gl character set designated by a select character set sequence. |
| Shift in | SI | 017 | Selects GO character set designated by a select character set sequence. |

Table 9 (Cont.): Control Characters Recognized by Rainbow 100 Computer

| Character | Mnemonic | Octal Code | Function |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { Device } \\ & \text { control } 1 \end{aligned}$ | DC1 | 021 | Processed as XON. DC1 causes the Rainbow 100 computer to resume (if previously stopped by XOFF) transmitting characters only in terminal mode. |
| Device control 3 | DC3 | 023 | Processed as XOFF. DC3 causes the Rainbow 100 computer to stop transmitting all characters except XOFF and XON. |
| Cancel | CAN | 030 | If received during an escape or control sequence, cancels the sequence and displays substitution character (cursor). |
| Substitute | SUB | 032 | Processed as CAN. |
| Escape | ESC | 033 | Processed as an escape sequence introducer. |
| Index | IND | 204 | Processes a LF. |
| Next line | NEL | 205 | Processes a CR LF sequence. |
| Horizontal | HTS | 210 | Sets a horizontal tab at the current cursor location. |
| Reverse index | RI | 215 | Equals a reverse line feed. |
| Single shift 2 | SS 2 | 216 | Selects G2 character set for the next character only. |
| Single shift 3 | SS3 | 217 | Selects G3 character set for the next character only. |
| Control sequence introducer | CSI | 233 | Equals an ESC [. |

## ESCAPE AND CONTROL SEQUENCES

Escape and control sequences provide additional control functions not provided by the single-character controls of the character set. These multiple-character sequences are not displayed; instead, they control Rainbow 100 computer operation. Escape and control sequences are defined by ANSI X3.41-1977 and X3.64-1979. See Appendix B for more information about sequences and sequence formats.

The ANSI-compatible control functions in this user guide have a mnemonic assigned by ANSI. If the control function is an ANSI private control function (defined by DIGITAL), the mnemonic begins with DEC. The escape and control sequences shown here use ASCII characters. You must type the characters in the sequences exactly as shown (upper or lowercase). The text provides the octal equivalent of each character in the sequence as a second reference. See Table 7 for decimal and hexadecimal representations.

The following section groups sequences by software compatibility (ANSI or VT52) and function (Table l0). Appendix A summarizes all control functions.

## Error Recovery

Current standards do not specify the action performed when the terminal receives a control function with an error. Errors are incorrect parameters; invalid control functions. The terminal usually recovers from these errors by performing as much of the function as possible. The specific error recovery procedures are as follows:

- Unrecognized control functions are usually ignored.
- Unsupported control functions (valid control functions not listed in this user guide) are usually ignored, but may produce unexpected results.
- If a 7-bit control character from Table 7 is received within a sequence, the terminal performs the function of the control character, followed by the function of the sequence.
- If cancel (CAN, octal 030) or substitute (SUB octal 032) is received during a sequence, the current sequence is aborted. The terminal displays the substitute character, followed by characters in the sequence received after CAN or SUB.
- If an 8-bit control character from Table 8 is received, the current escape sequence is aborted, and the function of the character is performed.
- If an 8-bit displayable character is received from Table 8, the current escape sequence continues and the 8-bit character is displayed.

## Ansi-Compatible Sequences

```
Set-Up Feature and Mode Selection
    Set mode (SM) and reset mode (RM)
ANSI/VT52 Compatibility
        ANSI/VT52 mode (DECANM)
Scrolling
        Scroll mode (DECSCLM)
Scrolling Region
        Set top and bottom margins (DECSTBM)
Origin
        Origin mode (DECOM)
Cursor Positioning
        Cursor up (CUU)
        Cursor down (CUD)
        Cursor forward (CUF)
        Cursor backward (CUB)
        Cursor position (CUP)
        Horizontal and vertical position (HVP)
        Index (IND)
        Reverse index (RI)
        Next line (NEL)
        Save cursor (DECSC)
        Restore cursor (DECRC)
Columns Per Line
        Column mode (DECCOLM)
Auto Wrap
        Auto wrap mode (DECAWM)
Screen Background
        Screen mode (DECSCNM)
    Line Feed/New Line
        Line Feed/New Line mode (LNM)
    Keyboard Action
        Keyboard action mode (KAM)
Auto Repeat
        Auto repeat mode (DECARM)
    *Local Echo
        Send-receive mode (SRM)
Cursor Key Character Selection
        Cursor key mode (DECCKM)
Keypad Character Selection
        Numeric keypad (DECKPNM)
        Application keypad (DECKPAM)
Character Sets and Selection
        Select character set (SCS)
        Single shift 2 (SS2)
        Single shift 3 (SS3)
Character Attributes
        Select graphic rendition (SGR)
Tab Stops
        Horizontal tab sets (HTS)

## ANSI-Compatible Sequences

ANSI-compatible sequences meet ANSI standards X3.64-1979 and X3.41-1974. This section describes the ANSI control functions used by the terminal. You can select ANSI compatibility from the keyboard in Set-Up or have the computer use a sequence. (See VT52-Compatible Sequences in this chapter).

Set-Up Feature and Mode Selection - Set-Up features change how the Rainbow 100 computer operates. You can select these features from the keyboard or through escape sequences.

Some Set-Up features are modes. A mode affects Rainbow 100 computer operation. The Rainbow 100 computer uses the selected mode until you or an escape sequence changes the selection. Table ll lists Set-Up features and modes. Modes are changed by using set mode (SM) and reset mode (RM) sequences. Set and reset the terminal modes by using the following sequences.

NOTE

```
Ps represents a variable parameter
selected from a list of parameters. A
series of asterisks (***) represent the
parameter in the octal sequence. The
parameter is transmitted using decimal
ASCII characters. When you set several
modes with a single SM or RM sequence, a
semicolon (i, octal 073) separates
parameters.
```

Set Mode (SM)

Sets one or more modes specified by selective parameters (Ps) in the parameter string.

Reset Mode (RM)

Resets one or more modes specified by selective parameters (Ps) in the parameter string.

| Set-Op Feature or Mode | Change by Escape Sequences | Change from Keyboard in Set-Up |
| :---: | :---: | :---: |
| On/off line** | No | Yes |
| Columns per line | Yes (DECCOLM) | Yes |
| Tab stops | Yes (HTS/TBC)* | Yes |
| Scroll rate | No | Yes |
| Auto repeat | Yes (DECARM) | Yes |
| Screen background | Yes (DECSCNM) | Yes |
| Cursor | No | Yes |
| Margin bell volume | No | Yes |
| Keyclick volume | No | Yes |
| ANSI/VT5 2 | Yes (DECANM) | Yes |
| Auto XON/XOFF** | No | Yes |
| US/UK character set | Yes (SCS)* | Yes |
| Auto Wrap | Yes (DECAWM) | Yes |
| Line Feed/New Line | Yes (LNM) | Yes |
| Local echo** | Yes (SRM) | Yes |
| Print termination character** | Yes (DECPFF) | Yes |
| Printer extent** | Yes (DECPEX) | Yes |
| One or two stop bits | No | Yes |
| Receive parity | No | Yes |
| Break enable** | No | Yes |
| Disconnect character enable** | No | Yes |
| Disconnect delay** | No | Yes |
| Auto answerback enable** | No | Yes |
| Power | No | Yes |
| Modem data/parity bits | No | Yes |
| Transmit speed | No | Yes |
| Receive speed | No | Yes |
| Modem control** | No | Yes |
| Printer data/parity bits | No | Yes |
| Transmit/receive speed | No | Yes |
| Application keypad mode/ numeric keypad mode | Yes (DECKPAM/DECKPNM)* | No |
| Cursor key mode | Yes (DECCKM) | No |
| Origin mode | Yes (DECOM) | No |
| Insertion-replacement mode | Yes (IRM) |  |
| *These features are not change (RM) sequences. | using the set mode (SM) | and reset mode |

Table 12 lists the ANSI-specified modes and their selective parameters (Ps). Table 13 lists the ANSI-compatible private modes and their selective parameters. When you change ANSI-compatible private modes, the first character in the parameter string is a question mark (?, octal 077). All parameters in the sequence are interpreted as ANSI compatible private parameters. This chapter explains each mode in detail and provides the sequences to set and reset each mode.

The following example shows the use of the question mark (used with ANSI private parameters) and semicolon (used with multiple parameters). The sequence sets both column and scroll modes.

```
ESC [ ? 3 ; 4 h
033 133 077 063 073 064 150
```

Table 14 describes modes specified in ANSI X3.64-1979 that are permanently set, permanently reset, or not applicable. See the ANSI standard for more information about these modes.

Table 12: ANSI-Specified Modes

| Name | Mnemonic | Parameter (Ps) |
| :--- | :--- | :--- |
|  |  |  |
| Error (ignored) | - | 0 |
| Keyboardaction | KAM | 2 |
| Insertion-replacement | IRM | 4 |
| Line Feed/New Line | LNM | 20 |

Table 13: ANSI-Compatible Private Modes

| Name | Mnemonic | Parameter (Ps) |
| :--- | :--- | :--- |
| Error (ignored) | - | 0 |
| Cursor key | DECCKM | 1 |
| ANSI/VT52 | DECANM | 2 |
| Column | DECCOLM | 3 |
| Scroll | DECSCLM | 4 |
| Screen | DECSCNM | 5 |
| Origin | DECOM | 6 |
| Auto wrap | DECAWN | 7 |
| Auto repeat | DECARM | 8 |
| Printer form feed* | DECPFF | 18 |
| Printer extent* | DECPEX | 19 |
| *Happens only in terminal mode. |  |  |

NOTE
The application keypad and numeric keypad modes are selected using dedicated sequences, not set and reset mode sequences. See Keypad Character Selection in this chapter for more information.

Table 14: Permanently Selected Modes

| Name | Mnemonic | Selection | Function |
| :---: | :---: | :---: | :---: |
| ```Control representation``` | CRM | Reset | Rainbow 100 computer performs control functions without displaying a character to represent control function received. |
| Editing boundary | EBM | Reset | Characters moved outside the margins are lost; terminal does not perform erasing and cursor positioning functions outside the margins. This does not affect horizontal and vertical position (HVP) and cursor position (CUP) sequences. |
| Erasure | ERM | Set | All characters displayed can be erased. |
| Format effector action | FEAM | Reset | Terminal immediately performs control functions that affect the screen display. |
| Format effector transfer | FETM | N/A | - |
| Guarded area transfer | GATM | N/A | - |
| Horizontal editing | HEM | N/A | - |
| Multiple area transfer | MATM | N/A | - |
| Positioning unit | PUM | Reset | Terminal specifies horizontal and vertical positioning parameters in control functions in units of character position. |
| Selected area transfer | SATM | N/A | - |
| Status reporting transfer | SRTM | Reset | Terminal transmits status reports by using device status report (DSR) sequences. |
| Tabulation stop | TTM | N/A | - |
| Vertical editing | VEM | N/A | - |

ANSI/VT52 Compatibility - The Rainbow 100 computer is compatible with both ANSI and private DIGITAL standards. Therefore, you can use new software that meets both ANSI standards and existing software designed for previous terminals (such as the VT52).

ANSI-compatible sequences meet ANSI standards X3.64-1979 and X3.41-1974. You select ANSI compatibility by using the ANSI/VT52 mode (DECANM) sequence in VT52 mode. See VT52-Compatible Sequences in this chapter for details on selecting ANSI sequence compatibility. In ANSI mode, the following sequence selects (VT52 mode).

Features and modes selected in ANSI mode are also used in VT52 mode. However, these features and modes usually cannot change in VT52 mode.

VT52 Mode (DECANM)

In ANSI mode, reset selects VT52 compatibility. In VT52 mode, the Rainbow 100 computer responds like a VT52 to private DIGITAL sequences.

Scrolling - Scrolling is the upward or downward movement of existing lines on the screen. This makes room for more display lines at either the top or bottom of the scrolling region. There are two methods of scrolling, jump scroll and smooth scroll. Select the type of scrolling by using the following sequences.

NOTE
In full-duplex communication, the auto XON/XOFF Set-Up feature prevents the loss of received characters when using smooth scroll. If auto XON/XOFF is not used, fill characters are needed.

Scroll Mode (DECSCLM)
ESC [ ? 4 h
033133077064150
Set selects smooth scroll. Smooth scroll rate selected in Set-Up.
ESC [ ? $\quad \begin{array}{llll} & 1\end{array}$
033133077064154
Reset selects jump scroll. Jump scroll lets the terminal add lines to the screen as fast as possible.

Scrolling Region - This inclusive region is the area of the screen defined by top and bottom margins. The margins determine which screen lines move during scrolling. Characters added outside the scrolling region do not cause the screen to scroll. The minimum size of the scrolling region is two lines. Therefore, the line number of the top margin must be less than the number of the bottom margin. The origin mode selects line numbers relative to the whole screen or the scrolling region.

After the margins are selected, the cursor moves to the home position. The origin mode feature also affects the home position. Select the top and bottom margins of the scrolling region by using the following sequence.

NOTES: When you power up or use the system reset command the scrolling region becomes the full screen.

Pt and Pb represent variable numeric parameters. The parameters are decimal numbers transmitted to the terminal as ASCII characters. Asterisks (***) represent one or more variable numeric parameters in the octal sequence.

Set Top and Bottom Margins (DECSTBM)

Selects top and bottom margins, defining the scrolling region. Pt is line number of first line in the scrolling region. Pb is line number of bottom line. If Pt and Pb are not selected, the complete screen is used (no margins).

Origin - This mode determines if the cursor can move outside the scrolling region (the area between the top and bottom margins). You can move the cursor outside the margins with the cursor position (CUP) and horizontal and vertical position (HVP) sequences.

Lines on the screen are numbered according to the location of the home position. Home position is always line l, column l. The cursor moves to the new home position whenever origin mode is selected. Select origin mode by using the following sequences.

NOTE
When you power up or use the system reset command, origin mode resets.

## Origin Mode (DECOM)

ESC [ ? $\quad$ ? h
033133077066150
Set selects home position in scrolling region. Line numbers start at top margin of scrolling region. The cursor cannot move out of scrolling region.

ESC [ ? $\quad 6 \quad 1$
033133077066154

Reset selects home position in upper-left corner of screen. Line numbers are independent of the scrolling region (absolute). Use CUP and HVP sequences to move cursor out of scrolling region.

Cursor Positioning - The cursor indicates the active screen position where the next character will appear. The cursor moves:

- One column to the right when a character appears
- One line down after a line feed (LF, octal 012), form feed (FF, octal 014) or vertical tab (VT, octal 013) (Line feed/new line may also move the cursor to the left margin). If at the bottom margin, this causes an upward scroll.
- One line up after a reverse index, if at the top margin, it causes a downward scroll.
- To the left margin after a carriage return (CR, octal 015)
- One column to the left after a backspace (BS, octal 0l0)
- To the next tab stop (or right margin if no tabs are set) after a horizontal tab character (HT, octal 0ll)
- To the home position when the top and bottom margins of the scrolling region (DECSTBM) or origin mode (DECOM) selection changes.

You can also move the cursor by using the following sequences.

## NOTE

Pn represents a variable numeric parameter. The parameter is a decimal number transmitted to the terminal by using ASCII characters. If you select no parameter or 0 , the terminal assumes the parameter equals l. Asterisks (***) represent one or more characters in the octal sequence.

Cursor Up (CUU)

| ESC | $\left[\begin{array}{ll}\text { Pn } & \text { A } \\ 033 & 133 \\ * * * & 101\end{array}\right.$ |
| :--- | :--- | :--- | :--- |

Moves cursor up $P n$ lines in same column. Cursor stops at top margin.

## Cursor Down (CUD)

ESC [ Pn B
033133 *** 102
Moves cursor down Pn lines in same column. Cursor stops at bottom margin.

## Cursor Forward (CUF)

ESC [ Pn C

033133 *** 103
Moves cursor right Pn columns. Cursor stops at right margin.

Cursor Backward (COB)
ESC [ Pn D

033133 *** 104
Moves cursor left Pn columns. Cursor stops at left margin.

Cursor Position (CUP)

033133 *** 073 *** 110
Moves cursor to line Pl, column Pc. If Pl or Pc are not selected or selected as 0, the cursor moves to first line or column, respectively. Origin mode (DECOM) selects line numbering and ability to move cursor into margins.

NOTE

> Pl and Pc represent variable numeric parameters. The parameter is a decimal number that represents one or more characters transmitted to the terminal as ASCII characters. Asterisks (***) represent the variable parameter in the octal sequence.
> Cup operates the same as the horizontal and vertical position (HVP) sequence.

Cursor Position (Home) (CUP)
ESC [ H
033133110
Moves cursor to home position, selected by origin mode (DECOM).

Horizontal and Vertical Position (HVP)
ESC [ Pl ; Pc f
033133 *** 073 *** 146
Moves cursor to line Pl, column Pc. If Pl or Pc are not selected or selected as 0 , the cursor moves to first line or column, respectively. Origin mode (DECOM) selects line numbering and ability to move the cursor into margins.

NOTE
HVP operates the same as the cursor position (CUP) sequence.

```
    ESC [ f
    033133 146
Cursor moves to home position selected by origin mode (DECOM).
Index
    ESC D or IND
    033 104 204
Moves cursor down one line in same column. If cursor is at bottom
margin, screen performs a scroll-up.
Reverse Index (RI)
    ESC M or RI
    033 115 2l5
Moves cursor up one line in same column. If cursor is at top margin,
screen performs a scroll-down.
Next Line (NEL)
    ESC E or NEL
    033 105 205
Moves cursor to first position on next line. If cursor is at bottom
margin, screen performs a scroll-up.
Save Cursor (DECSC)
    ESC }
    0 3 3 0 6 7
Saves cursor position, character attribute (graphic rendition),
character set, and origin mode selection. (See restore cursor.)
Restore Cursor (DECRC)
    ESC 8
    033 070
Restores previously saved cursor position, character attribute
(graphic rendition), character set, and origin mode selection. If
none were saved, the cursor moves to home position.
Columns Per Line - This mode selects the number of columns in a display line, 80 or 132. With either selection, the screen can display 24 lines. Select the number of columns per line by using the following sequences.
```

NOTE
When you change the number of columns per line, the screen is erased. This also sets the scrolling region for full screen (24 lines).

## Column Mode (DECCOLM)

```
    ESC [ ? 3 h
    033 133 077 063 150
Set selects l32 columns per line.
    ESC [ ? ? 3 1
    033 133 077 063 154
Reset selects 80 columns per line.
Auto Wrap - This mode selects where a received character will appear when the cursor is at the right margin. Select auto wrap by using the following sequences.
```

NOTE
Regardless of the auto wrap Set-Up feature selection, the tab character never moves the cursor to the next line.

## Auto Wrap Mode (DECAWM)

ESC [ ? 7 h
$033133077 \quad 067150$
Set selects auto wrap. Any display characters received when cursor is at right margin appear on next line. The display scrolls up if cursor is at end of scrolling region.

ESC [ ? 7 l
033133077067154
Reset turns auto wrap off. Display characters received when cursor is at right margin replace previously displayed character.

Screen Background - This mode selects either light (reverse) or dark display background on the screen. Select screen mode by using the following sequences.

## Screen Mode (DECSCNM)

ESC [ ? 5 h
033133077065150
Set selects reverse screen, a white screen background with black characters.

ESC [ ? $\quad$ ? 1
033133077065154
Reset selects normal screen, a black screen background with white characters.

Line Feed/New Line - This mode selects the control character (s) transmitted by Return. Line feed/new line also selects the action taken by the terminal when receiving line feed, form feed, and vertical tab. Table 15 provides a summary of the feature. Select line feed/new line mode by using the following sequences.

Line Feed/New Line Mode (LNM)
ESC [ 2 0 h
033133062060150
Set causes a received line feed, form feed, or vertical tab to move cursor to first column of next line. Return transmits both a carriage return and line feed. This selection is also called new line option.

ESC [ 2 0 1
033133062060154
Reset causes a received line feed, form feed, or vertical tab to move cursor to next line in current column. Return transmits a carriage return.

Table 15: Line Feed/New Line Feature

| Feature <br> Selection | Key Pressed- <br> Character Sent | Character Received-Function |
| :--- | :--- | :--- |
| Off | Return-CR | CR-Cursor moves to left margin. |
| Off | Line Feed-LF | LF, FF, VT-Cursor moves to next line <br> but stays in same column. |
| On | Return-CR LF | CR-cursor moves to left margin. |
| On | Line Feed-LF | LF, FF, VT-Cursor moves to left margin |

Keyboard Action - Keyboard action lets the computer turn the keyboard on or off. This mode always resets when you enter Set-Up. Select keyboard action mode by using the following sequences.

Keyboard Action Mode (KAM)
ESC [ 2 h
033133062150
Set turns off keyboard and turns on the Wait indicator.
ESC [ 2 1
033133062154
Reset turns on keyboard and turns off the wait indicator.

```
Auto Repeat - This mode selects automatic key repeating. A key pressed for more than one-half second automatically repeats the transmission of the character. Key repeating does not affect Set-Up, ESC, Return, Enter, Hold Screen, and Ctrl. Select auto repeat mode by using the following sequences.
```

## Auto Repeat Mode (DECARM)

## ESC [ ? 8 h

033133077070150
Set selects auto repeat. A key pressed for more than one-half second automatically repeats.
ESC [ ? $8 \quad 1$
$033133 \quad 077 \quad 070154$
Reset turns off auto repeat. Keys do not automatically repeat.

Local Echo (Keyboard Send-Receive) - This mode selects local echo, only in terminal mode, which causes every character transmitted by the Rainbow 100 computer to automatically appear on the screen. Therefore, the host computer does not have to transmit (echo) the character back to the Rainbow 100 computer for display. When local echo is off, the Rainbow 100 computer only transmits characters to the host computer. The host computer must echo the characters back to the Rainbow 100 computer for display. Select send-receive mode by using the following sequences.

Send-Receive Mode (SRM)

```
ESC [ 1 2 h
033 133 061 062 150
```

Set turns off local echo. The Rainbow 100 computer transmits characters to the host computer, which must echo characters for display on screen.

```
ESC [ lllll
033 133 061 062 154
```

Reset selects local echo. Characters transmitted to the host computer automatically appear on the screen.

Cursor Key Character Selection - Cursor key mode selects the set of characters transmitted by the cursor keys. See Table 16 for the codes transmitted by the cursor keys. Select cursor key mode by using the following sequences.

NOTE
If you power up or use a system reset command, cursor key mode resets. This mode also resets during a communication line connection in all communication except full-duplex no modem control (FDX A).

## Cursor Rey Mode (DECCKM)

```
    ESC [ ? l h
    033 133 077 061 150
Set selects cursor keys to generate (application) functions.
    ESC [ ? l l l
    033 133 077 061 154
Reset selects cursor keys to generate cursor control sequences.
    Table 16: ANSI Cursor Control Key Codes
    Cursor Key Mode Cursor Key Mode
    Reset Sends Set Generates
        Cursor Control Application
Cursor Key Sequence Functions
ESC [ A ESC O A
033 133 101 033 117 101
ESC [ B ESC O B
033 133 102 033 117 102
ESC [ C ESC O C
033 133 103 033 117 103
ESC [ D ESC O D
033 133 104 033 117 104
```

Keypad Character Selection - The numeric keypad generates either numeric characters or control functions. Selecting application or numeric keypad mode determines the type of characters. The program function (PF) keys generate the same characters regardless of the keypad character selection. See Table 17 for the characters generated by the keypad. Select the keypad mode by using the following sequences.

NOTE
When you power up or use a system reset command, the terminal selects numeric keypad mode. This mode is also selected during communication line connections, except full-duplex no modem control (FDX A) .

## Application Keypad Mode (DECKPAM)

ESC
$=$
033075
Selects application keypad mode. Keypad generates control functions.

| Key | Numeric Reypad Mode | Applica Mode | on |
| :---: | :---: | :---: | :---: |
| Enter* | $\begin{array}{llll} \text { CR or } & \text { CR } & \text { LF } \\ 015 & 015 & 012 \end{array}$ | $\begin{array}{cc} \text { ESC } & 0 \\ 033 & 117 \end{array}$ | $\begin{gathered} M \\ 115 \end{gathered}$ |
| PF1 | $\begin{array}{ccc} \text { ESC } & 0 & \text { P } \\ 033 & 117 & 120 \end{array}$ | $\begin{array}{cc} \text { ESC } & 0 \\ 033 & 117 \end{array}$ | $\begin{gathered} \mathbf{P} \\ 120 \end{gathered}$ |
| PF2 | $\begin{array}{ccc} \text { ESC } & 0 & Q \\ 033 & 117 & 121 \end{array}$ | $\begin{array}{cc} \text { ESC } & 0 \\ 033 & 117 \end{array}$ | $\begin{gathered} Q \\ 121 \end{gathered}$ |
| PF3 | $\begin{array}{ccc} \text { ESC } & 0 & \text { R } \\ 033 & 117 & 122 \end{array}$ | $\begin{array}{cc} \text { ESC } & 0 \\ 033 & 117 \end{array}$ | $\begin{gathered} \mathbf{R} \\ 122 \end{gathered}$ |
| PF4 | $\begin{array}{ccc} \text { ESC } & 0 & \text { S } \\ 033 & 117 & 122 \end{array}$ | $\begin{array}{cc} \text { ESC } & 0 \\ 033 & 117 \end{array}$ | S 123 |

NOTE
In ANSI mode, if the codes are echoed back to the terminal or if the terminals is off-line, the last character of the sequence appears on the screen; for example, PF4 appears as an "S".
*In numeric keypad mode, Enter generates the same characters as Return. You can change the Return key character code with the line feed/new line feature. When off, this feature causes the key to generate a single control character (CR, octal 015). When on, this feature causes the key to generate two characters (CR, octal 015 and LF, octal 012).

Character Sets and Selection - The Rainbow 100 computer can display the characters found in Tables 18 through 20.

The Rainbow 100 computer can select only one character set at a time. Therefore, the Rainbow 100 computer uses the following three character sets, with some characters appearing in more than one set. The GR displayable characters found in Table 8 are always available.

```
United States
United Kingdom
Special characters and line drawing (VTl00 compatible)
```

Tables 18 through 20 show the character sets. The United States and United Kingdom character sets meet the standard of the "ISO international register of character sets to be used with escape sequences." The space (SP) and control characters are the same in all sets.

The terminal uses two active character sets at any one time. The computer designates these sets as GO and Gl, using the select character set (SCS) sequence. Then a single control character can switch between sets. Shift in (SI, octal 017) invokes the GO character set; shift out (SO, octal Ol6) invokes the Gl character set.

The designated character sets are active until the terminal receives another SCS sequence. You can use the SCS sequence as often as needed to designate GO and Gl. Designate GO by using the following sequences.

NOTE
The terminal uses the character set
selected in Set-Up after all
communication line connections, except
full-duplex no modem control (FDX A).

Select Character Set (SCS)
ESC ( A
033050101
Designates the UK character set as GO.
ESC ( B
033050102
Designates the US character set as GO.
ESC $\quad 0$
033050060
Designates the special characters and line drawing character set as G0.

Designate Gl by using the following sequences.

Select Character Set (SCS)
ESC ) A
033051101
Designates the UK character set as Gl.
ESC ) B
033051102
Designates the US character set as Gl.
ESC ) 0
033051060
Designates the special characters and line drawing character set as Gl.

The terminal also has G2 and G3 character sets. However, these are always the default (selected in Set-Up) character sets. You select G2 and G3 for only one character at a time. The terminal returns to the previous character set after displaying a single character. Select G2 and G3 for one character by using the following sequences.

|  | column | 0 |  | 1 |  | 2 |  | 3 |  | 4 |  | 5 |  | 6 |  | 7 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  | $0$ |  | 1 |  |  |  |  |
| 0 | 0000 | NUL | $\begin{aligned} & 0 \\ & 0 \\ & 0 \\ & \hline \end{aligned}$ | DLE | $\begin{array}{\|l\|} \hline 20 \\ 16 \\ 10 \\ \hline \end{array}$ | SP | $\begin{array}{\|l\|} \hline 40 \\ 32 \\ 20 \\ \hline \end{array}$ | 0 | $\begin{aligned} & \hline 60 \\ & 48 \\ & 30 \\ & \hline \end{aligned}$ | @ | $\begin{array}{\|c\|} \hline 100 \\ 64 \\ 40 \\ \hline \end{array}$ | P | $\begin{array}{\|l\|} \hline 120 \\ 80 \\ 50 \\ 50 \end{array}$ | , | $\begin{array}{\|l\|} \hline 10 \\ 96 \\ 60 \\ \hline \end{array}$ | p | $\begin{array}{r}160 \\ 112 \\ 70 \\ \hline 10\end{array}$ |

KEY

```
Single Shift 2 (SS2)
    ESC N or SS2
    033 116 216
Selects G2 (default) character set for one character. You select G2
in Set-Up.
Single Shift 3 (SS3)
    ESC 0 or SS3
    033 117 217
Selects G3 (default) character set for one character. You select G3
in Set-Up.
```

- Underline
- Reverse video (character background opposite of the screen background feature)
- Blink
- Bold (increased intensity)
- Any combination of these attributes (applied in the order of reception)
You can select one or more character attributes at one time. Selecting an attribute does not turn off other attributes already selected. After you select an attribute, all characters received by the terminal appear with that attribute. If you move the characters by scrolling, the attribute moves with the characters. Select the character attributes by using the following sequences.

```
```

Character Attributes - The terminal can display the following

```
Character Attributes - The terminal can display the following
character attributes that change the character display without
character attributes that change the character display without
changing the character.
changing the character.
Select Graphic Rendition (SGR)
ESC [ m or ESC [ 0 m
\(033133155 \quad 033133 \quad 060155\)
Turns off character attributes.
ESC [ 1 m
033133061155
Selects bold (increased intensity).
ESC [ 4 m
033133064155
Selects underline.
ESC [ 5 m
033133064155
Selects blink.
ESC [ 7 m
033133067155
Selects reverse video.
```

Tab Stops - You select tab stop positions on the horizontal lines of the screen. The cursor advances (tabs) to the next tab stop when the terminal receives a horizontal tab (HT, octal 0ll). If no tab stops are set, horizontal tab moves the cursor to the right margin. Set and clear the tab stops by using the following sequences.

Horizontal Tabulation Set (HTS)

| ESC | H | or |
| :--- | :--- | :--- |
| 033 | 110 |  |
| 0310 |  |  |

Sets a horizontal tab stop at cursor position.

Tabulation Clear (TBC)
ESC [ $\quad$ g or ESC [ $0 \quad 9$
$\begin{array}{lllllll}033 & 133 & 147 & 033 & 133 & 060 & 147\end{array}$
Clears a horizontal tab stop at cursor position.
ESC [ 3 [ $\quad 3$
0331331063147

Clears all horizontal tab stops.

Line Attributes - These are display features that affect a complete display line. The cursor selects the line affected by the attribute. The cursor stays in the same character position when the attribute changes. However, if the attribute would move the cursor past the right margin, the cursor stops at the right margin. When you move lines on the screen by scrolling, the attribute moves with the line. Select line attributes by using the following sequences.

NOTE
If you erase an entire line by using the erase in display (ED) sequence, the line attribute changes to single-height and single-width.

Double-Height Line (DECDHL)

| Top | Half: | Bottom Half: |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ESC | $\#$ | 3 |  | ESC | $\#$ |
| 03 | 4 |  |  |  |  |
| 033 | 043 | 063 | 033 | 043 | 064 |

Makes the line with the cursor the top or bottom half of a double-height, double-width line. Sequences work in pairs on adjacent lines. The same character must be used on both lines to form full characters. If the line was single-width, single-height, all characters to the right of center are lost.

## Single-Width Line (DECSWL)

ESC \# 5
033043065
Makes the line with the cursor single-width, single-height. This is line attribute for all new lines on screen.

## Double-Width Line (DECDWL)

ESC \# 6
033043066

Makes the line with the cursor double-width, single-height. If the line was single-width, single-height, all characters to the right of center screen are lost.

Erasing - Erasing removes characters from the screen without affecting other characters on the screen. Erased characters are lost. The cursor position does not change when erasing characters or lines.

If you erase a line by using the erase in display (ED) sequence, the line attribute becomes single-height, single-width. If you erase a line by using the erase in line (EL) sequence, the line attribute is not affected.

Erasing a character also erases any character attribute of the character. Erase characters by using the following sequences.

Erase in Line (EL)

| ESC | $[$ | K |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 033 | 133 | or | ESC | $[$ | 0 | K |
| 033 | 133 | 060 | 113 |  |  |  |

Erases from cursor to end of line, including cursor position.
ESC [ 1 K
033133061113
Erases from beginning of line to cursor, including cursor position.
ESC [ 2 K
033133062113
Erases complete line.

Erase in Display (ED)
ESC [ J or ESC [ 0 J
033133112033133060112
Erases from cursor to end of screen, including cursor position.
ESC [ 1 J
033133061112
Erases from beginning of screen to cursor, including cursor position.

Erases complete display. All lines are erased and changed to single-width. Cursor does not move.

Computer Editing - Editing allows the computer to insert or delete characters and lines of characters at the cursor position. The cursor position does not change when inserting or deleting lines. Delete characters or insert and delete lines by using the following sequences.

NOTE
Insertion-replacement mode (RM) selects how characters are added to the screen. See Inserting and Replacing Characters in this chapter for more information.

Delete Character (DCH)

033133 *** 120
Deletes Pn characters, starting with character at cursor position. When a character is deleted, all characters to the right of cursor move left. This creates a space character at right margin. This character has all attributes off.

Insert Line (IL)

033133 *** 114
Inserts Pn lines at line with cursor. Lines displayed below cursor move down. Lines moved past the bottom margin are lost. This sequence is ignored when cursor is outside scrolling region.

Delete Line (DL)
ESC [ Pn M
033133 *** 115
Deletes Pn lines starting at line with cursor. As lines are deleted, lines displayed below cursor move up. Lines added to bottom of screen have spaces with same character attributes as last line moved up. This sequence is ignored when cursor is outside scrolling region.

Inserting and Replacing Characters - The terminal displays received characters at the cursor position. This mode determines how the terminal adds characters to the screen. Insert mode displays the character and moves previously displayed characters to the right. Replace mode adds characters by replacing the character at the cursor position. Select insertion-replacement mode by using the following sequences.

This mode resets after a communication line connection in all communication except full-duplex no modem control (FDX A). It also resets any time NVM is saved.

## Insertion-Replacement Mode (IRM)

ESC [ 4 h
033133064150
Set selects insert mode and turns INSERT on. New display characters move old display characters to the right. Characters moved past the right margin are lost.

ESC [ 4 I
$033133 \quad 064154$
Reset selects replace mode and turns INSERT off. New display characters replace old display characters at cursor position. The old character is erased.

Printing in Terminal Mode - The Rainbow 100 computer has a serial printer interface for local printing. The host computer can select all print operations by using escape sequences. You can only select two of the print operations from the keyboard, auto print and Print Screen.

When you print characters from the screen, Rainbow 100 computer terminal and printer tab stops are ignored. Print characters are spaced with the space (SP, octal 040) character. The terminal transmits a carriage return (CR, octal 015) and line feed (LF, octal 012) after the last printable character of a line - but not a space character.

A line of double-height characters prints as two identical lines of single-width characters. Double-width characters print as single-width characters on a single line.

Before selecting a print operation, check the printer status by using the printer status report (DSR) in ANSI mode. Do not select a print operation if the serial printer is not ready to print. Select print operations by using the following sequences.

## Media Copy (Auto Print ON) (MC)

ESC [ ? 5 i
033133077065151
Turns on auto print. A display line prints after you move cursor off the line, using a line feed, form feed, or vertical tab (also transmitted to printer).

The line also prints during an auto wrap. Auto wrap lines end with a CR,LF。

```
Media Copy (Auto Print Off) (MC)
    ESC [ ? 4 i
    033 133 077 064 151
Turns off auto print.
NOTE
Printer controller has a higher priority than auto print. Therefore, you can select printer controller and print characters during auto print.
Media Copy (Printer Controller On) (MC)
ESC [ 5 i
\(033 \quad 133 \quad 065 \quad 151\)
Turns on printer controller. The terminal transmits received characters to printer without displaying them. The terminal does not insert or delete spaces, provide line delimiters, or select the correct printer character set.
Media Copy (Printer Controller Off) (MC)
ESC [ 4 i
033133064151
Turns off printer controller. Always move printhead to left margin before turning off printer controller.
Media Copy (Print Cursor Line) (MC)
ESC [ ? \(\quad\) ? i
033133077161151
```

Prints display line with cursor. Cursor position does not change. Print cursor line ends when line prints.

Media Copy (Print Screen) (MC)
ESC [ i or ESC [ 0 i
033133151033133060151
Prints the screen. Printer extent (DECEXT) selects full screen or scrolling region to print. Select scrolling region by using set top and bottom margins (DECSTBM) sequence. Print Screen ends when screen prints.

Printer Extent in Terminal Mode - This mode selects the full screen or the scrolling region to print during a Print Screen. Select printer extent mode by using the following sequences.

## Printer Extent Mode (DECPEX)

ESC [ ? $\quad$ ? $\quad 9 \quad h$ 033133077061071150

Set selects the full screen to print during a Print Screen.
ESC [ $\quad \begin{array}{lllll}? & 1 & 9 & 1\end{array}$ $\begin{array}{llllll}033 & 133 & 077 & 061 & 071 & 154\end{array}$

Reset selects the scrolling region to print during a Print Screen.

Print Termination Character in Terminal Mode - This mode determines if the terminal should transmit a print termination character after a Print Screen. The form feed (octal, 014) control character serves as the print termination character. Select printer form feed mode by using the following sequence.

ESC [ $\quad \begin{array}{lllll}\quad & 1 & 8 & h\end{array}$
033133077061070150
Set selects form feed as print termination character. The terminal transmits this character to printer after each Print Screen.

ESC [ $\quad \begin{array}{lllll}1 & 1 & 8 & 1\end{array}$
$\begin{array}{llllll}033 & 133 & 077 & 061 & 070 & 154\end{array}$
Reset selects no termination character.

Reports - The Rainbow 100 computer transmits reports in response to escape sequence requests. Reports determine terminal emulation type and status, and cursor position. The report requests and responses are as follows.

NOTE
The terminal does not respond to the DSR, DA, or DECID sequences during printer controller operation.

Device Status Report (DSR)
ESC [ 5 n
$033133 \quad 065156$
Computer requests a status report (using a DSR sequence).
ESC [ 0 n
$033 \quad 133 \quad 060 \quad 156$
Terminal response: Ready, no malfunctions detected.
These next four codes apply to terminal mode only.
ESC [ ? $\quad$ ? 5 n
033133077061065156
Computer requests a printer status report. Terminal checks status of
printer. This report should be requested before any print operation.
ESC [ ? $\quad$ ? $\quad 3$
033133077061063156
Printer not connected to terminal. Data terminal ready (DTR) signal
of the printer has not been on since terminal turned on.
ESC [ ? 1 l n
033133077061061156
Printer not ready to print. Printer DTR was on, but is now off.
ESC [ ? 1 0 n
$033133077061 \quad 060 \quad 156$
Printer ready to print. Printer DTR is on.
Cursor Position Report (CPR)
ESC [ 6 n
033133066156
Requests a cursor position report.
ESC [ P1 ; Pc R
033133 *** 073 *** 122
Terminal reports cursor position in response to DSR sequence request
from computer. Pl indicates line and Pc indicates column. No
parameters, or parameters of 0 , indicate cursor is at home position.
Origin mode (DECOM) determines whether line numbering is relative to
the top of the screen or the top of the scrolling region.
Device Attributes (DA)
ESC [ c or ESC [ 0 c
$033133143 \quad 033133 \quad 060143$
A request for Rainbow 100 computer identification.
Identify Terminal (DECID)
ESC Z
033132
A request for Rainbow 100 computer identification. Rainbow 100 computer uses device attributes (DA) to respond. Future DIGITAL terminals may not support this sequence. Therefore, new software should use device attributes.
Device Attributes (DA)
ESC [ ? 6 c
033133077066143

```
Reset to Initial State(RIS)
    ESC c
    033 143
Resets the terminal to its initial state.
```

## CAUTION

It is recommended that this not be used due to unpredictable results.

Adjustments - The terminal has a screen alignment pattern that lets Field Service personnel adjust the screen. Display the screen alignment pattern by using the following sequence.

Screen Alignment Display (DECALN)

## ESC \# 8

033043070
Fills screen with uppercase E's for screen focus and alignment. This command is used by DIGITAL Manufacturing and Field Service personnel.

## VT52-Compatible Sequences

VT52-compatible sequences meet private DIGITAL standards. Therefore, the terminal can use existing software designed for previous terminals (such as the VT52). You can select VT52 compatibility from the keyboard in Set-Up or the computer can use a sequence. (See ANSI-Compatible Sequences in this chapter).

NOTE
In VT5 2 mode, 8-bit control characters and displayable characters are processed just as in ANSI mode.

Modes - In VT2 mode, you cannot select most terminal features by using sequences. You can, however, select the following three modes by using sequences: ANSI mode, application keypad mode on, and application keypad mode off (numeric keypad mode on).

ANSI/VT52 Compatibility - The terminal is compatible with both ANSI and private DIGITAL standards. Therefore, the terminal can use new software that meets ANSI standards and existing software designed for previous terminals (such as the VT52). ANSI-compatible sequences meet standards X3.64-1979 and X3.41-1974. You use ANSI mode to select most terminal features; the terminal uses the same features when it switches to VT52 mode. You cannot, however, change most of these features in VT52 mode. Select ANSI compatibility by using the following sequence.
ANSI Mode (DECANM)
ESC ..... $<$
033 ..... 074
The terminal interprets all sequences according to ANSI standardsX3.64-1979 and X3.41-1974. The VT52 escape sequences described inthis chapter are not recognized.
Cursor Positioning - The cursor indicates the active screen positionwhere the next character will appear. You must select the margins forVT52 mode in ANSI mode. If you do not select margins, the terminaluses the complete screen. The cursor moves:

- One column to the right when a character appears
- One line down after a line feed, form feed, or vertical tab(Line feed/new line may also move the cursor to left margin.)
- To the left margin after a carriage return
- One column to the left after a backspace
- To the next tab stop (or right margin if no tabs are set)after a horizontal tab character.
You can also move the cursor by using the following sequences.
Cursor Up
ESC A
033101
Moves cursor up one line in same column. Cursor stops at top margin.
Cursor Down
ESC ..... B
033102
Moves cursor down one line in same column. Cursor stops at bottommargin.
Cursor Right
ESC C
033103
Moves cursor one column to right. Cursor stops at right margin.
Cursor Left
ESC ..... D
033104
Moves cursor one column to left. Cursor stops at left margin.

```
Cursor to Home
    ESC H
    033110
Moves cursor to home position.
Direct Cursor Address
    ESC Y line column
    033 131 *** ***
Moves cursor to specified line and column. Line and column numbers
are ASCII characters whose codes are their octal value plus octal 037.
For example, line l column 8 parameters are octal 040 (first line) and
octal 047 (eighth column).
Reverse Line Feed
    ESC I or RI
    033 111 2l5
Moves cursor up one line in same column. If cursor is at top margin,
screen performs scroll-down.
Keypad Character Selection - The numeric keypad generates either numeric characters or control functions. Select application keypad mode to generate control functions. Exit application keypad mode (select numeric keypad mode) to generate numeric characters. See Table \(2 l\) for the characters generated by the keypad. Enter and exit application keypad mode by using the following sequences.
```

NOTE

When you power up or use a system reset command, the terminal exits application keypad mode (selects numeric keypad mode). This mode is also selected during communication line connections, except full-duplex no modem control (FDX A).

## Enter Application Keypad Mode

## ESC

 075Keypad generates sequences used by the application program.

Exit Application Keypad Mode (Numeric Keypad Mode)
ESC >
033076
Keypad generates characters that match the numeric, comma, period, and minus sign keys on main keyboard.

| Key | Application Keypad Mode Off (Numeric Keypad Mode) | Application Mode On |  |  | Keypad |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 174 | I | Not equal to | Subscript 8 |
| 175 | \} | UK pound sign | Subscript 9 |
| 176 | ~ | Centered dot | Paragraph |

Erasing - Erasing removes characters from the screen. Erased characters are lost. Erase characters by using the following sequences.

Erase to End of Line
ESC K
033113
Erases all characters from cursor to end of current line, including cursor position. Cursor does not move.

ESC J
033112
Erases all characters from cursor to end of screen, including cursor to end of position. Cursor does not move.

Printing in Terminal Mode - The Rainbow 100 computer has a serial printer interface for local printing. The host computer can select all print operations by using sequences. You can only select two print operations from the keyboard, auto print and Print Screen.

When you print characters from the screen, terminal and printer tab stops are ignored. Characters printed are spaced with the space (SP, octal 040 ) character. The Rainbow 100 computer transmits a carriage return and line feed - but not a space character - after the last printable character of a line.

A line of double-height characters print as two identical lines of single-width characters. Double-width characters print as single-width characters on a single line.

Before selecting a print operation, check the printer status by using the printer status report (DSR) in ANSI mode. Do not select a print operation if the serial printer is not ready to print. Select print operations by using the following sequences.

## Auto Print

ESC
033136
Turns on auto print. A display line prints after you move cursor off the line, using a line feed, form feed, or vertical tab (also transmitted to printer).

The line also prints during an auto wrap. Auto wrap lines end with CR, LF.

ESC
$0331 \overline{3} 7$

Turns off auto print.

NOTE
Printer controller has a higher priority than auto print. Therefore, you can select printer controller and print characters during auto print.

Turns on print controller. The terminal transmits received characters to printer without displaying them. The terminal does not insert or delete spaces, provide line delimiters, or select printer character set.

ESC $X$
033130
Turns off printer controller. Always move printhead to left margin before turning off printer controller.

## Print Cursor Line

ESC V
033126
Prints display line with cursor. Cursor position does not change. Print cursor line ends when the line prints.

## Print Screen

ESC ]
033135

Prints the screen. Printer extent (DECPEX) determines whether full screen or scrolling region prints. Select scrolling region by using DECSTBM sequence. Print Screen ends when screen prints.

Reports - The Rainbow 100 computer transmits reports in response to escape sequence report requests. The Rainbow 100 computer generates only one report in VT52 mode. The report requests and responses are as follows.

## Identify

ESC Z
033132
This escape sequence requests the Rainbow 100 computer to identify itself.

ESC / Z
033057132
Rainbow 100 computer responds "I am a VT52." (Same as VT52.)

## APPENDIX A

## PROGRAMMING SUMMARY

## GENERAL

This appendix provides a summary of Rainbow 100 computer escape and control sequences.

Figure 4 shows the codes generated by the standard keys. Figure 5 shows the control codes generated by the function keys; shaded keys do not need Ctrl down to generate the control character.

Figure 4: Standard Key Codes

Programming Sequences
The rest of this appendix repeats the information in summary form.

Control Characters Received

| Name | Character <br> Mnemonic | Octal <br> Code | Function |
| :--- | :--- | :--- | :--- |
| Null | NUL | 000 | Ignored when received (not stored <br> in input buffer) and used as a <br> fill character. |
| End of  <br> transmission EOT | 004 | Can be selected as a disconnect <br> character. When used as a |  |
| turnaround character, the |  |  |  |
| disconnect character is DLE-EOT. |  |  |  |

| Name | Character Mnemonic | Octal Code | Function |
| :---: | :---: | :---: | :---: |
| Enquire | ENQ | 005 | Transmits answerback message. |
| Bell | BEL | 007 | Generates bell tone. |
| Backspace | BS | 010 | Moves cursor to the left one character position; if cursor is at left margin, no action occurs. |
| Horizontal | HT | 011 | Moves cursor to next tab stop, or to right margin if there are no more tab stops. |
| Line feed | LF | 012 | Causes a line feed or a new line operation (See line feed/new line mode.) Causes printing if in terminal mode and if auto print operation selected. |
| Vertical tab | VT | 013 | Processed as LF. |
| Form feed | FF | 014 | Processed as LF. |
| Carriage return | CR | 015 | Moves cursor to left margin on current line. |
| Shift out | So | 016 | Selects G1 character set designated by a select character set sequence. |
| Shift in | SI | 017 | Selects G0 character set designated by a select character set sequence. |
| Device control 1 | DCl | 021 | Processed as XON. DCl causes terminal to continue transmitting characters. <br> (Terminal mode only). |
| Device control 3 | DC3 | 023 | Processed as XOFF. DC3 causes terminal to stop transmitting all characters except XOFF and XON. (Terminal mode only). |
| Cancel | CAN | 030 | If received during an escape or control sequence, cancels the sequence and displays substitution character ( ) . |
| Substitute | SUB | 032 | Processed as CAN. |
| Escape | ESC | 033 | Processed as a sequence introducer. |
| Index | IND | 204 | Processes a line feed. |
| Next line | NEL | 205 | Processes as a CR LF sequence. |
| Horizontal tab set | HTS | 210 | Sets a horizontal tab at cursor location. |
| Reverse index | RI | 215 | Equals a reverse line feed. |

| Name | Character <br> Mnemonic | Octal <br> Code | Function |
| :--- | :--- | :--- | :--- |
| Single shift 2 SS2 | SS | 216 | Selects G2 character set for the <br> next character only. |
| Single shift 3 | SS3 | 217 | Selects G3 character set for the <br> next character only. |
| Control sequence <br> introducer | CSI | 233 | Equals an ESC [. |

## APPENDIX B

## CONTROL FUNCTIONS (SEQUENCE FORMATS)

## GENERAL

This appendix summarizes the ANSI code extension techniques defined in standards X3.4l-1974 and X3.64-1979. Those specifications cover many special cases and details not included here.

## Control Functions

The ANSI standards define types of characters used for specific purposes. You can determine a character's type by its position in the ASCII table (Table 22). There are two general categories of characters:

- display (columns 2 through 7; 10-15)
- control (columns 0 and $1 ; 8$ and 9)

This table and the ANSI system can work for either a 7-bit or 8-bit character environment. The Rainbow 100 computer uses both 7-bit and 8-bit characters.

NOTE
The ASCII 7-bit table corresponds to International Standards Organization (ISO) standard 646 and International Telegraph and Telephone Consultive Committee (CCITT) alphabet 5.

All control characters and groups of characters (sequences) not intended for display on the screen are control functions. Not all control functions perform an action in every ANSI device, but each device can recognize all control functions and discard any that do not apply to it. Therefore, each device performs a subset of the ANSI functions.

Because different devices use different subsets, compliance with ANSI does not mean compatibility between devices. Compliance only means that a particular function, if defined in the ANSI standard, is invoked by the same control function in all devices. If an ANSI device does not perform an action that has a control function defined in the ANSI standard, it cannot use that control function for any other purpose.

## Escape and Control Sequences

Escape and control sequences provide more controls in addition to the control characters in the ASCII 7-bit table. These multiple-character control sequences are not displayed but control the displaying, processing, and transmission of characters. At the end of a sequence or during an error condition, the terminal continues to display received characters.

## Escape Sequences

The format for an escape sequence is as follows:

| ESC | 1....1 | F |
| :--- | :--- | :--- |
| 033 | $040-057$ | $060-176$ |
| Escape <br> sequence <br> introducer | Intermediate <br> characters <br> (0 or more <br> characters) | Final |
| character |  |  |
| (1 character) |  |  |

Escape Sequence Introducer - This is the ESC character (octal 033) defined by ANSI X3.4-1977. After receiving ESC, the terminal stores (but does not display) all control function characters received in the proper range.

Intermediate Characters - These are characters received after ESC in the octal range of 040 - 057 (column 2 of the ASCII table). The terminal stores intermediate characters as part of the control function.

#### Abstract

Final Character - This is a character received after ESC in the octal range of 060 - 176 (columns 3-7 of the ASCII table). The final character indicates the end of the control function. The intermediate and final characters together define the function of the sequence. The terminal then performs the specified function and continues to display received characters. ANSI standard control functions have a final character in the octal range of 100 - 176 (columns 4-7 of the ASCII table). Private sequences have a final character in the octal range of 060 - 077 (column 3 of the ASCII table).

## Example

Action: Designate ASCII character set as GO.

## Sequence

```
ESC ( B
```

033050102

Escape sequence Intermediate Final character
introducer character

## Control Sequence Format

The format of a control sequence is as follows:

| CSI | P..... P | 1..... 1 | F |
| :---: | :---: | :---: | :---: |
| 033133 | 060-077 | 040-057 | 100-176 |
| Control sequence introducer | Parameter characters (O or more characters) | Immediate characters (0 or more (characters) | Final character (l character) |

Control Sequence Introducer - The CSI is the ESC (octal 033) and [ (octal 133) characters defined by ANSI X3.41-1977. These characters provide 8-bit control functions by using 7-bit characters. After receiving CSI characters, the Rainbow 100 computer stores (but does not display) all control function characters received in the proper range.

During an escape sequence, if the Rainbow 100 computer receives an 8-bit control character, (octal 200-237), the escape sequence is aborted. The 8-bit control character's function is then executed if it is one of the supported functions.

An 8-bit display character, received during an escape sequence, is displayed and does not affect the escape sequence in process.

Parameter Characters - These are characters received after the CSL character, in the octal range of $060-077$ (column 3 of the ASCII table). The parameter characters modify the action or interpretation of the control function. The terminal interprets parameter characters as private when the $<=>$ ? characters (octal 074-077) begin the parameter string. The : character (octal 072) is reserved. This means an ANSI-specified control sequence can have a parameter function with a private interpretation.

The Rainbow 100 computer uses two types of parameter characters, numeric and selective. A numeric parameter represents a decimal number, designated by Pn. The decimal characters have a range of $0-9$ (octal 060 - 071). A selective parameter comes from a list of specified parameters, designated by Ps.

If a control sequence includes more than one parameter, the parameters are separated by a delimiter, the ; character (octal 073).

Intermediate Characters - These are characters received after the CSl character, in the octal range of $040-057$ (column 2 of the ASCII table). The terminal stores these characters as part of the control function.

## NOTE

The terminal does not use intermediate characters in control functions.

```
Final Character - This is a character received after the CSl
character, in the octal range of 100 - l76 (columns 4 - 7 of the ASCII
table). The final character indicates the end of the control
function. The intermediate and final characters together define the
function of the sequence. The terminal then performs the specified
function and continues to display received characters. ANSI standard
control functions have a final character in the octal range of 100 -
157 (columns 4 - 6 of the ASCII table). Private sequences have a
final character in the octal range of 160 - l76 (column 7 of the ASCII
table).
```

## Example

```
Action: Clear all horizontal tabs.
```

## Sequence

```
\(\left.\begin{array}{lccl}\text { ESC } & \text { [ } & 3 & \text { g }\end{array}\right]\)
```

## Sequence Examples

```
These examples show the use of multiple functions selected in one sequence, private parameters and private sequences.
```

```
ESC [ 2 ; 1 y Invoke self-test
033133062073061171 ( \(y=\) ANSI private sequence)
```

## APPENDIX C

## RAINBOW 100 COMPUTER AND VT100 TERMINAL FAMILY DIFFERENCES

The following is a list of the differences between the Rainbow 100 and members of the VTlOO family of terminals. Also included are certain "points-of-interest" that should be considered by programmers.

## DEC'S MULTINATIONAL 8-BIT CHARACTER

The Rainbow 100 computer implements the printing graphics found in DEC's Multinational Character set, and the 8-bit character codes for the printing characters. It is a subset of the Multinational Character set. It is not the full character set. In particular, it does not implement all the control sequences specified for the Multinational Character set.

## 8-BIT CHARACTER CODES

The Rainbow 100 computer accepts and acts on 8-bit character codes, the VTl02 terminal always strips the 8th bit. If 8-bit codes are received in VT5 2 mode, they will be handled the same as in ANSI mode.

## Cl CONTROL CODES

Rainbow 100 computer executes ( 8 -bit) control codes for index, next line, horizontal tab set, reverse index, single shift 2 , single shift 3, control sequence introducer. Reception of any Cl control code will abort an escape sequence in process (CSI restarts an escape sequence). The control codes are processed and the graphic characters are displayed. This is not a recommended way of aborting escape sequences. It is not guaranteed to work this way in future versions of the Rainbow personal computer family.

## KEYBOARD AND 8-BIT KEY CODES

Rainbow l00's keyboard is called the LK201 keyboard. The Rainbow 100 computer never asks the LK201 Keyboard's non-US keys (those keys that generate 8-bit character codes). Software written for Rainbow should always treat 8-bit characters generated by the keyboard the same as 7-bit characters. In future Rainbow systems 8-bit characters will be generated by all keyboards, US and non-US. This is to say, an operator will be able to generate an 8-bit "a-umlat" character from any national version of the keyboard.

## KEYBOARD COMPOSE KEY

When in terminal mode, the Compose key is non-functional and rings the bell when pressed. When the operating system is running, the Compose key, if pressed, generates an escape sequence. Application software should never use this key for any purpose. In future Rainbow 100 systems the key will be used by the firmware or the operating system to generate 8-bit character codes.

## KEYBOARD CONTROL CODE GENERATION

Rainbow 100 computer requires use of the Shift key for some of the keyboard-entered control codes. This is due to the uncertainty of character location on various non-US national keyboards.

## SET-UP PURGING KEYBOARD BUFFER

When the Set-Up key is pressed to enter Set-Up mode in the Rainbow 100, the key-holding buffer is cleared which causes any unserviced keys to be lost and Set-Up is immediately honored.

## WAIT INDICATOR

When the keyboard buffer fills up, the Rainbow 100 computer ignores further entries and sounds the bell. It lights the Wait LED as the VTl02 terminal does. The bell and Wait LED are used to notify the user that the key was not accepted.

## KEYBOARD PRINT SCREEN KEY IN TERMINAL MODE

Terminal mode print functions are implemented via the Print Screen key on the Rainbow 100 computer. VTl02 terminal uses the keypad Enter key. Rainbow l00's Print Screen is equivalent to VTl02's <Shift/Enter> and Rainbow l00's <Ctrl/Print Screen> is equivalent to VTl02's <Ctrl/Enter>.

## KEYBOARD HOLD-SCREEN KEY

The Hold Screen key on the Rainbow 100 computer does not work the same as the NO SCROLL key on a VTl02 terminal. On a VTl02 terminal it sends an XOFF/XON as it toggles back and forth the <Ctrl/S> and <Ctrl/Q> typed from the keyboard can be used to get the same effect. Setting Hold Screen for the Rainbow 100 computer does not necessarily cause an XOFF to be sent. It sets an internal flag that causes the "receive character" process to loop until the flag is cleared. This effectively "hangs" any console output (normal or direct) in console mode. In terminal mode this "hang" causes the comm receive buffer to fill up until it reaches the high water mark at which point it will send an XOFF, if enabled by Set-Up. After the Hold Screen is removed, characters are removed from the receive buffer until the low water mark is reached which causes XON to be sent, if enabled.

As a result of this method of implementation, Rainbow 100 computer honors Hold Screen even in "local", VTl02 terminal does not.

In Rainbow 100 terminal mode, after using Hold Screen on incoming data, the last char for display is being 'held'. Entering setup, switching to local, and exiting from setup does not clear the 'hold' state or the char. When 'hold' is finally removed, the char originally being 'held' is displayed before any locally generated characters.

In the Rainbow 100 computer, if the Print Screen key is depressed while the Hold Screen is asserted, the print is deferred until after the 'hold' is removed and char being 'held' is processed. The VTl02 terminal prints a screen even if the NO SCROLL key as been depressed.

## KEYBOARD CURSOR KEY MODES

Cursor key mode and keypad mode for the Rainbow 100 computer are independent. In the VTl02 terminal, the cursor keys only send application codes if both cursor and keypad modes are set to 'application'.

## PRINTER CHARACTER SETS IN TERMINAL MODE

The Rainbow 100 computer assumes the printer is capable of properly receiving 8-bit DEC Multinational characters.

## PRINTING BLOB CHARACTERS IN TERMINAL MODE

When printing from the screen in terminal mode and encountering a 'blob' character, the VTl02 terminal sends ASCII 'SUB' to the printer. The Rainbow 100 computer sends the VTl00 line-drawing graphics character 'blob' bracketed by the appropriate character set selection escape sequence if required.

## PRINTER PORT DEFAULTS

Factory Set-Up defaults are not the same as the VTl02 terminal for the printer port.

## PRINT CURSOR LINE OPERATION IN TERMINAL MODE

At the completion of a 'print cursor line' operation, Rainbow loo computer sends the escape string to restore the printers Go char set in between the terminating carriage return and line feed. VTlo2 terminal sends it after the line feed.

The following anomaly occurs when a printer cable is attached to a Rainbow after it is powered up, but the printer end of the cable is not attached to anything.

## TERMINAL ID

The Rainbow 100 computer identifies itself as a VTl02 terminal.

## INSERT AND DELETE LINE ESCAPE SEQUENCES

| Insert Line: | CSI | Pn | $L$ |
| :--- | :--- | :--- | :--- |
| Default line: | CSI | Pn | $M$ |

If the cursor is on the last line of the scrolling regions, and the line is double-width, then after execution of either of the above controls, the active line attributes are:

A0 On Rainbow 100: single-width
BO On the VTlO2 terminal: whatever the active line attributes were before execution of the control sequence.

## ALTERNATE ROM CHARACTER SETS

Rainbow 100 computer does not implement the alternate ROM character sets found in the VTlO2 terminal.

## ALTERNATE ROM AND LED ESCAPE SEQUENCES

The Rainbow 100 computer parses but ignores the escape sequences to set GO and Gl to the alternate ROM and alternate ROM special graphics (ESC ( 1 , ESC ( 2 , ESC ) 1 , ESC ) 2 ). It will parse but ignore the escape sequence for LED control (ESC [ Pn q ). Rainbow has no alternate ROMs and the LEDs are not available for software control.

## G2 AND G3 CHARACTER SETS

G2 and G3 are permanently designated as the NVM default character set. They are either US or UK variations of Rainbow's subset of the multinational character set. They can be invoked for single characters by the single-shift-2 or single-shift-3 escape sequences or the Cl control codes.

## ERASE LINE AND ERASE DISPLAY

In Rainbow l00, escape sequences for erase in line and erase in display, only the first selective parameter is processed. If more than one is sent, the additional parameters are ignored.

## ABORTING ESCAPE SEQUENCES BY INTERMEDIATE CHARACTERS

Rainbow 100 computer aborts escape sequence parsing when it finds an intermediate char causing all following characters to be displayed. VTl02 terminal aborts the sequence but continues parsing until it finds a final char so the intervening part of the escape sequence does not display.

## INSERT AND REPLACE MODES

Rainbow 100 computer always sets insertion/replacement mode to replacement before saving into NVM. These modes are not user selectable. They are only selectable by software.

## SELFTEST ESCAPE SEQUENCES

The Rainbow 100 computer parses but ignores the escape sequences to run self tests (ESC [ 2 , Pn $y$ ). Also the device status report request (ESC [ 5 n ) will always cause the ready, no malfunctions reply ( ESC L 0 n ).

## RESET TO INITIAL STATE

In Rainbow 100 computer, ESC $c$ (reset to initial state) does not reset keypad and cursor keys to their normal modes. RIS is a dangerous sequence to issue from workstation software. It is not recommended to be used. Its function will change in future versions of Rainbow.

## VT52 MODE AND ORIGIN MODE

The Rainbow 100 computer in VT52 mode honors the origin mode setting, VT102 terminal in VT5 5 modes does not.

## AUTOWRAP MODE

The Rainbow 100 computer maintains the wrap-pending flag unconditionally and tests it conditionally. VTl02 terminal maintains the flag conditionally and tests it conditionally. This implementation affects where the next character goes when the auto-wrap mode is CHANGED while the cursor is in the 'line-filled' position. The VTl02 terminal places the cursor in a different place than the Rainbow. Software is recommended to not use auto wrap mode for controlling the placement of the text on the screen.

```
In Rainbow 100 computer the Tab character always clears the
wrap-pending flag. As a result, if Tab is the 81 st char in an 80 char
line, char 82 will not wrap but char 83 will. In a VTlo2 terminal,
char 82 will wrap.
```

## DISABLE CURSOR AND ENABLE CURSOR FIRMWARE FUNCTIONS

The Rainbow l00's ENABLE and DISABLE cursor firmware functions are designed to only work with the direct video formware functions. They will not work with the normal single character at a time screen updates.

## XON/XOFF PROTOCOL AND BUFFER SIZE IN TERMINAL MODE

In Rainbow 100 terminal mode, the second XOFF is sent at
'buffer-full'. In a VTlo2 terminal, the second XOFF is sent l2 char
before 'buffer-full'. Also the Rainbow 100 buffer is 255 char in
size, a VTl02 terminal is 128 .

FULL DUPLEX COMMUNICATION PROTOCOL IN TERMINAL MODE
The Rainbow 100 computer always precedes the dropping of DTR with a EOT character. The VTl02 terminal does not always do this. The Rainbow 100 computer does not disconnect if it is placed in Local mode. The VTl02 terminal disconnects if placed in local mode.

HALF DUPLEX COMMUNICATION SUPPORT IN TERMINAL MODE
The Rainbow 100 terminal emulation does not support the half duplex communication protocols of the VTl02 terminal.

## APPENDIX D

## INTERNATIONAL LANGUAGE KEYBOARDS

The figures in this appendix illustrate the different national language keyboards that are or will be available. One of the main differences is the label strip that you add to the top of the keyboard. The label strip comes in the country kit.
