29 0029 1 Facility: Command Definition Utility, CLD Parser Module 1  
30 0030 1  
31 0031 1 Abstract: This module is one of a few modules that implements the  
32 0032 1 parser for CLD files. This parser translates the CLD source  
33 0033 1 language into an intermediate representation composed of  
34 0034 1 nodes linked in a directed graph.  
35 0035 1  
36 0036 1 Environment: Standard CDU environment.  
37 0037 1  
38 0038 1 Author: Paul C. Anagnostopoulos  
39 0039 1 Creation: 30 November 1982  
40 0040 1

```

OVERALL STRUCTURE

```

: 95 0829 1 :
: 96 0830 1 :
: 97 0831 1 :
: 98 0832 1 : This is a recursive descent compiler. That means that the source language,
: 99 0833 1 : as contained in CLD files, is compiled by routines which recognize certain
100 0834 1 : subsets of the language and call other such routine to recognize the rest
101 0835 1 : of the language. Routines may be invoked recursively when the syntax
102 0836 1 : is recursive.
103 0837 1 :
104 0838 1 : The language is assumed to be LL(1), which means it is parsed from left
105 0839 1 : to right and each construct can be recognized by inspecting only its
106 0840 1 : first token, with no backtracking. It is not strictly LL(1), but the
107 0841 1 : exceptions aren't too bad.
108 0842 1 :
109 0843 1 : The complete syntax for CLD files is presented below. Terminals are
110 0844 1 : shown in upper case, while nonterminals are shown in lower case. There
111 0845 1 : is a parsing routine for each nonterminal. This routine is responsible
112 0846 1 : for pulling all tokens for its construct from the file, and creating
113 0847 1 : one or more nodes which are the intermediate representation of the construct.
114 0848 1 :
115 0849 1 : The lexical and syntactic portions of the CDU are based primarily on work
116 0850 1 : done by A. Davie and R. Morrison, described in their book "Recursive Descent
117 0851 1 : Compiling".
118 0852 1 :
119 0853 1 : The intermediate representation of the file is composed of a set of nodes
120 0854 1 : linked together as a directed graph. Each node represents a single semantic
121 0855 1 : entity, with any subordinate entities as its children. Children are
122 0856 1 : linked together in a sister chain, as opposed to having an array of
123 0857 1 : child pointers in the node. The right-hand side of the syntax description
124 0858 1 : shows how the syntax is mapped into nodes.
