 DIGITAL.

MODIFICATION HISTORY:

- 1-001 - Start of revision history. RKR 13-SEPT-79
- 1-002 - Add COBSK_EXC_ORG. MWS 4-OCT-79
- 1-003 - Add Minimums and Maximums to series of COBSK symbols.
 Redefine module name data structure by making first
 word a length of entry.
 Add COBSK_EXC_CLRSS (Close Reel)
 Add COBSK_ACC_SIZE (Buffer size in COBSACCEPT)
 Add COBS_USE_EXIT (Special signal between handler and
 COB\$\$INVOKE_USE)
 RKR 18-OCT-79
- 1-004 - Add COBSA_NAM_FILES to module name data structure.
 RKR 18-OCT-79
- 1-005 - Remove COBS_USE_EXIT. (It needs to be in COBMSG.MDL
 so that S.MCB knows about it, so that the .MAR world can
 get at it. RKR 20-OCT-79
- 1-006 - Add COBSK_DIS_SIZE. RKR 21-OCT-79
- 1-007 - Change comment on COBSK_ERR_BADCL. RKR 29-OCT-79
- 1-008 - Changed macro COBSL_USE_COUNT into COBSB_USE_COUNT
 and added COBSB_GUSE_COUNT which is a count of the global
 file entries. Also added COBSA_CHK_PROC which is the
 definition of the offset of USE_PROCEDURE address in the
 signal arguments. Note that these changes were made by the
 COBOL group during the time when there was only part-time
 RTL support provided. Also added comments to the definition

- 1-009 - List for COBSIOEXCEPTION. LB 04-MAR-81
- 1-009 - Added macro definitions for the Data Base USE procedure entries. Also added associated literals for data base USE entries. LB 11-MAR-81
- 1-010 - Added more field references for data base USE entries. LB 12-MAR-81
- 1-011 - Changed macro for COBSA_CHK_PROC to be an offset of 12 in the signal array to account for the addition of an FAO count parameter which will reside at offset 8 in the signal array. Same change occurred for the corresponding data base macro (COBSA_DBCHK_PROC). LB 16-APR-81
- 1-012 - Added a macro COBSA_OPN_PROC to be an offset of 16 in the signal array due to the addition of another parameter being signalled in module COBSIOEXCEPTION. Changed the name of macro COBSA_CHK_PROC to COBSA_FIL_PROC to more accurately reflect the information we are referencing. LB 21-APR-81
- 1-013 - Added a literal entry to the COBSERROR set of entries (COBSK_ERR DBARG). Also incremented the maximum value for the case stmt by one to account for the added entry. LB 1-MAY-81
- 1-014 - Added COBSK_EXC_KEY. Also incremented the maximum value for the case stmt by one to account for the added entry. PDG 24-JUL-81
- 1-015 - Added COBSK_EXC_UNLCK as new OPEN error for explicit record locking. Also incremented the maximum value for the case stmt by one to account for the added entry. LB 8-AUG-81
- 1-016 - Fixed spelling error on OPEN error. LB 12-AUG-81
- 1-017 - Added COBSK_EXC_PIO. Previous IO NOT successful READ for DELETE and START statements. Updated COBSK_EXC_MAXM to 7. BH 1-SEP-83

↑
Definitions for the module name data structure. This structure is used by routine COB\$FIND NAME, which is called by COB\$CALL and COB\$CANCEL. It is built in PSECT COB\$NAMES 2 by a contribution from each COBOL module. The bracketing PSECTS COB\$NAMES 1 and COB\$NAMES 3 are used to find the beginning and end of the structure.

MACRO

```
COBSL_NAM_LEN= 0,0,32,0 %      ! Length in bytes of name entry
COBSA_NAM_NAME= 4,0,32,0 %     ! Pointer to ASCII module name
COBSA_NAM_ENTRY=8,0,32,0 %     ! Address of module entry point
COBSL_NAM_LLEN= 12,0,32,0 %   ! Length of local storage for module
COBSA_NAM_LOCAL=16,0,32,0 %   ! Address of local storage for module
COBSA_NAM_FILES=20,0,32,0 %   ! Address of counted list of RAB addresses
```

LITERAL

```
COBSS_NAM=      24;           ! Length of block
                               ! *** Should never be used to
                               ! search this table ***
```

Definitions for the first parameter of COB\$ERROR, the routine called by compiled code to report an error. If the error is COB\$K ERR SORT, a second parameter is also present, which is the status returned by SORT.

LITERAL

COB\$K_ERR_MIN=0,	: Minimum for CASEing
COB\$K_ERR_ALTER=0,	: GO TO with no preceding ALTER
COB\$K_ERR_PERFR=1,	: Recursive activation of PERFORM
COB\$K_ERR_PERFN=2,	: Nesting error for PERFORM
COB\$K_ERR_PERFT=3,	: TIMES value overflows longword
COB\$K_ERR_SUBSD=4,	: OCCURS DEPENDING value overflows longword
COB\$K_ERR_SUBSC=5,	: Subscript overflows longword
COB\$K_ERR_SORT=6,	: Error during SORT
COB\$K_ERR_INSPE=7,	: INSPECT CONVERTING lengths unequal
COB\$K_ERR_BADCL=8,	: CALL failed on routine (!AS)
COB\$K_ERR_DBARG=9,	: Expression value in DB arg list overflows longword
COB\$K_ERR_MAX=9;	: Maximum for CASEing

Definitions for the COBOL file context area.
 The fields COBSA_CTX_LINAG and following are present only if it is
 a lineage file. This area is allocated in PSECT \$LOCAL by the
 compiler for each file immediately preceding the RAB.

MACRO

COBSB_CTX_FLAGS=	-4,0,8,0 %	! Flag bits
COBSV_CTX_OPENL=	-4,0,1,0 %	! TRUE only if a LINAGE file has been opened but not yet written to.
COBSV_CTX_OPT=	-4,1,1,0 %	! TRUE only if it is an OPTIONAL file.
COBSV_CTX_FLK=	-4,2,1,0 %	! TRUE only if File closed WITH LOCK.
COBSV_CTX_PIO=	-4,3,1,0 %	! TRUE only if previous IO was successful READ
COBSB_CTX_FLAG2=	-3,0,8,0 %	! More flag bits
COBSV_CTX_OFNF=	-3,0,1,0 %	! TRUE only if Optional file not found.
COBSV_CTX_NNVR=	-3,1,1,0 %	! TRUE only if No next valid record.
COBSB_CTX_MODE=	-2,0,8,0 %	! OPEN mode
COBSB_CTX_ID=	-1,0,8,0 %	! Version number
COBSL_CTX_LINAG=	-8,0,32,0 %	! LINAGE storage
COBSL_CTX_FOOTI=	-12,0,32,0 %	! FOOTING storage
COBSL_CTX_TOP=	-16,0,32,0 %	! TOP storage
COBSL_CTX_BOTTO=	-20,0,32,0 %	! BOTTOM storage
COBSL_CTX_COUNT=	-24,0,32,0 %	! LINAGE-COUNTER itself

Values of COBSB_CTX_MODE.

LITERAL

COBSK_CTX_INPUT=0,	! INPUT mode
COBSK_CTX_OUTPU=1,	! OUTPUT mode
COBSK_CTX_I O= 2,	! I-O mode
COBSK_CTX_EXTEN=3,	! EXTEND mode
COBSK_CTX_MAX=3;	! Maximum for upper bound check

LITE AL

COBSS_CTX_NOLIN=4,	! Size of CTX area without LINAGE
COBSS_CTX_LINAG=24;	! Size of CTX area with LINAGE

Definition for the COBOL specific stack location (relative to FP, mapped as a REF BLOCK[BYTE]). This location is to be presumed initialized if and only if SFSA_HANDLER contains COB\$HANDLER.

MACRO

COB\$A_SF_USE= -4,0,32,0 %; ! Address of USE list

```

!+
! Definition for the USE description list pointed to by COB$A_SF_USE. This
! structure is allocated by the compiler in PSECT $PDATA if USE procedures are
! present in the module, and compiled code places its address in COB$A_SF_USE.
! It is used by COB$IOEXCEPTION to search for an applicable USE procedure if
! an I/O exception occurs.

```

MACRO

```

COB$A_USE_PNC= 0,0,32,0 %      ! Address of PERFORM nest counter
COB$A_USE_MODES=4,0,0,0 %     ! Base of OPEN mode entries, in order:
                               ! INPUT
                               ! OUTPUT
                               ! I-O
                               ! EXTEND
                               ! (Same order as COB$B_CTX_MODE)
COB$B_USE_COUNT=36,0,8,0 %    ! Count of file entries
COB$B_GUSE_COUNT=36,8,8,0 %   ! Count of global file entries
COB$A_USE_FILES=40,0,0,0 %    ! Base of first file entry

```

```

!+
! Definition for one USE description entry within the structure above.
! Mode entries begin at offset COB$A_USE_MODES and are two longwords each.
! File entries begin at offset COB$A_USE_FILES and are three longwords each.

```

MACRO

```

COB$A_USE_PROC= 0,0,32,0 %    ! Address of procedure
COB$A_USE_EOPR= 4,0,32,0 %    ! Address of end of PERFORM range block
COB$A_USE_RAB= 8,0,32,0 %     ! Address of RAB (only in file entries)

```

LITERAL

```

COB$S_USE_MODES=8             ! Size of an open mode entry
COB$S_USE_FILES=12           ! Size of a file entry

```

```

!+
! Definition of offsets of USE procedure addresses in signal arguments.

```

MACRO

```

COB$A_FIL_PROC = 12,0,32,0%   ! Addr of file specific USE procedure
COB$A_OPN_PROC = 16,0,32,0%   ! Addr of open mode specific USE procedure

```

!+
! Definition for the COBOL specific stack location (relative to FP, mapped as
! a REF BLOCK[.BYTE]).
!-

MACRO

COB\$A_DB_USE = -8,0,32,0%;

! \Accesses offset 8 from the stack
! which contains a ptr to the
! /Data Base USE list

```

!+
! Definition for the Data Base USE description list pointed to by COB$A_DB_USE.
! This structure is allocated by the compiler in PSECT $PDATA if USE procedures are
! present in the module, and compiled code places its address in COB$A_DB_USE.
! It is used by COB$DBEXCEPTION to search for an applicable USE procedure if
! a Data Base exception occurs.
!-

```

MACRO

```

COB$B_USE_CODE = 0,0,8,0%      ! Identifying code for data base exceptions
COB$A_DBUSE_PNC = 4,0,32,0%    ! Address of PNC for declaring program
COB$B_DBUSE_CNT = 8,0,8,0%    ! \# of DB USE procedures defined
                                ! in this program (includes both local
                                ! and global procedures defined in both
                                ! /this program and in containing programs
COB$B_GDBUSE_CNT = 8,8,8,0%    ! \# of global DB USE procedures
                                ! /defined in the local program
COB$A_DBUSE_ENT = 12,0,32,0%   ! Base address of 1st DB USE procedure

```

```

!+
! Definition for one Data Base USE description entry within the
! structure above. Note that COB$A_USE_PROC and COB$A_USE_EOPR
! are already defined in the USE list for routine COB$IOEXCEPTION.
! Also, note that COB$L_USELIT occupies the same field reference as
! COB$A_USE_RAB does for routine COB$IOEXCEPTION.
!-

```

MACRO

```

COB$A_USE_PROC = 0,0,32,0 %    ! Address of procedure
COB$A_USE_EOPR = 4,0,32,0 %    ! Address of end of PERFORM range block
COB$L_USE_LIT = 8,0,32,0 %     ! \A data base exception literal or zero
                                ! /for 'ON OTHER' or no 'ON'

```

LITERAL

```

COB$K_DBUSE_CODE = 1,         ! \Code indicating generic class
                                ! / = Data Base
COB$S_DBUSE = 12;            ! Size of a DB entry

```

```

!+
! Definition of offset of Data Base USE procedure address in the
! signal argument vector. (Used in COB$HANDLER when trying to find an
! applicable USE procedure.
!-

```

MACRO

```

COB$A_DBCHK_PROC = 12,0,32,0%

```

!+

COBSK_PTPUNCH= 6,	! COBSPAPERTAPEPUNCH logical name
COBSK_UNIT_MAX= 6;	! Maximum for CASEing

Buffer size allocated in COBSACCEPT. Represents largest record that can be ACCEPTted.

LITERAL

COBSK_ACC_SIZE = 1024 ;

Buffer size of temp buffer in COBSDISPLAY with which it will concatenate callers strings. Beyond this size, it resorts to heap storage.

LITERAL

COBSK_DIS_SIZE = 132 ;

This table contains 100 small screenshots of VAX/VMS system screens, arranged in a 10x10 grid. The screenshots show various system outputs, including:

- System Management:** Screens for 'TYPMAIN LIS', 'UNLOCK LIS', 'UTILSUBS LIS', and 'INTPAR SOL'.
- Log and Reports:** Screens for 'COBPROLOG REQ', 'COBDEF REQ', 'COBRTL', 'COBRTL MAP', 'COBBLNK REQ', 'COBACCDAT LIS', 'COBACCDWK LIS', 'COBACCDAY LIS', and 'COBACCUCU LIS'.
- System Status:** Various screens displaying system parameters, job queues, and resource usage.
- Job Control:** Screens showing job execution details and control options.

Each screenshot is a small-scale representation of the original system output, capturing the text-based interface and data presented to the user.
