;    34          0034  1 !
;    35          0035  1 !       This utility program creates a copy of one or more user-specified
;    36          0036  1 !       files.  Two or more files may optionally be concatenated to
;    37          0037  1 !       create a single output file.
;    38          0038  1 !
;    39          0039  1 ! ENVIRONMENT:
;    40          0040  1 !
;    41          0041  1 ! AUTHOR:  Ward Clark,  CREATION DATE:  19 August 1977
;    42          0042  1 !
;    43          0043  1 ! Modified by:
;    44          0044  1 !
;    45          0045  1 !       V03-014 TSK0015         Tamar Krichevsky          26-Jul-1984
;    46          0046  1 !               Use the constant 32 for the multi-block count, instead of
;    47          0047  1 !               the system multi-block count.
;    48          0048  1 !
;    49          0049  1 !       V03-013 TSK0014         Tamar Krichevsky          9-jun-1984
;    50          0050  1 !               Avoid an access violation by have BYPASS_CONCAT return a value.
;    51          0051  1 !               If this value is true, then stop processing.  If it is false,
;    52          0052  1 !               then continue copying files.
;    53          0053  1 !
;    54          0054  1 !       V03-012 TSK0013         Tamar Krichevsky          8-May-1984
;    55          0055  1 !               Rearrange the calls to CLI$GET_VALUE and LIB$FIND_FILE so that
;    56          0056  1 !               a command such as COPY a.a,a.a,a.a,a.a NL: will copy every file,
;    57          0057  1 !               instead of every other file.
```

```
;    58          0058  1 !
;    59          0059  1 !       V03-011 TSK0012         Tamar Krichevsky        25-Apr-1984
;    60          0060  1 !               Add a check, after trying to open the output file, to be
;    61          0061  1 !               sure that if the current operation is an APPEND and the output
;    62          0062  1 !               file was not found, then processing should stop.  No use
;    63          0063  1 !               appending to a non-existant file.
;    64          0064  1 !
;    65          0065  1 !       V03-010 TSK0011         Tamar Krichevsky        17-Mar-1984
;    66          0066  1 !               Add a missing "." , so that the correct files are opened when
;    67          0067  1 !               the input file has a wildcard in it's specification.  Copy the
;    68          0068  1 !               resultant file file name from LIB$FIND_FILE into the input
;    69          0069  1 !               file's NAM block and IN_NAME_DESC.  Otherwise, the confirm
;    70          0070  1 !               prompt, log messages and error reporting would use the wrong
;    71          0071  1 !               information.
;    72          0072  1 !
;    73          0073  1 !       V03-009 TSK0010         Tamar Krichevsky        27-Feb-1984
;    74          0074  1 !               Replace COPY's scheme for allocating I/O buffer pool (The I/O
;    75          0075  1 !               buffer pool is area in which COPY maintains its user buffers
;    76          0076  1 !               for RMS calls.)  The old scheme allocated virtual memory for
;    77          0077  1 !               the I/O buffer pool based on the processes working set size.
;    78          0078  1 !               The new scheme alloates enough virtual memory to hold the
;    79          0079  1 !               largest record or block transfer instead.
;    80          0080  1 !
;    81          0081  1 !               Convert input file parse and searching to LIB$FIND_FILE.
;    82          0082  1 !
;    83          0083  1 !       V03-008 TSK0009         Tamar Krichevsky        15-Feb-1984
;    84          0084  1 !               Fix RMS_SETUP so that the incompatible attributes message is
;    85          0085  1 !               not issued when the input or the output device is network.
;    86          0086  1 !
;    87          0087  1 !       V03-007 TSK0008         Tamar Krichevsky        3-Oct-1983
;    88          0088  1 !               Fix RMS_SETUP so that the incompatible attributes message is
;    89          0089  1 !               not issued when the input device is a unit record device.
;    90          0090  1 !               The input and output devices have to be the same kind of devices
;    91          0091  1 !               and be file structured before the information in the file header
;    92          0092  1 !               can be compared.
;    93          0093  1 !
;    94          0094  1 !       V03-006 TSK0007         Tamar Krichevsky        6-Sep-1983
;    95          0095  1 !               Fix an Access violation introduced in V30-005.  This time
;    96          0096  1 !               wild card copy operations didn't work.
;    97          0097  1 !
;    98          0098  1 !       V03-005 TSK0006         Tamar Krichevsky        1-Sep-1983
;    99          0099  1 !               Fix access violation introduced in V30-004.  Append operations
;   100          0100  1 !               didn't work.
;   101          0101  1 !
;   102          0102  1 !       V03-004 TSK0005         Tamar Krichevsky        29-Aug-1983
;   103          0103  1 !               Modify how the output file's XAB chain is reinitialized at the
;   104          0104  1 !               end of COPY$COPY.  This change has been made so that COPY
;   105          0105  1 !               adheres to the new philosophy about the propogation of
;   106          0106  1 !               file protection and revision dates.
;   107          0107  1 !
;   108          0108  1 !       V03-003 TSK0004         Tamar Krichevsky        23-Jan-1983
;   109          0109  1 !               Replace the command language interface with the the new CLI.
;   110          0110  1 !
;   111          0111  1 !               Add COPY$CHECK_FILE_FOR_MATCH routine which calls LIB$QUAL_FILE_MATCH
;   112          0112  1 !               to see if the input file should be copuied to the output file.
;   113          0113  1 !

;  270          0269  1 !++
;  271          0270  1 ! DETAILED FUNCTIONAL DESCRIPTION:
;  272          0271  1 !
;  273          0272  1 !       This utility program creates a copy of one or more user-specified
;  274          0273  1 !       files.  These files can be explicitly named or can be referred to
;  275          0274  1 !       through use of RMS wildcard file naming.  Two or more files may
;  276          0275  1 !       optionally be concatenated to create a single output file.
;  277          0276  1 !
;  278          0277  1 !       All file I/O is done using standard RMS facilities.  Therefore,
;  279          0278  1 !       the input and output files can exist on any device supported by RMS,
;  280          0279  1 !       including devices at remote network nodes.  If possible, file copying
;  281          0280  1 !       is done using block I/O.  Record I/O is used only when an input or
;  282          0281  1 !       output file is record oriented (e.g., terminal, unit record) or when
;  283          0282  1 !       a concatenated file is being copied.
;  284          0283  1 !
;  285          0284  1 !       This utility is intended to interface directly with a Command Language
;  286          0285  1 !       Interpreter (CLI) and cannot be directly invoked from Command Language
;  287          0286  1 !       level or from an executing program.  Numerous command options
;  288          0287  1 !       (i.e., qualifiers) are supported to allow the Command Language user
;  289          0288  1 !       to (1) optionally specify the location and attributes of the input
;  290          0289  1 !       and output files, and (2) control the reporting of each file copy.
;  291          0290  1 !
;  292          0291  1 !       If more than one copy operation is specified in a single COPY request,
;  293          0292  1 !       each file copy is performed independent of the others.  Therefore,
;  294          0293  1 !       the failure of one file copy operation (e.g., I/O error, input
;  295          0294  1 !       file not found) does not affect the remaining copy requests.  The
;  296          0295  1 !       single exception to this rule is that unprocessed concatenated input
;  297          0296  1 !       files are bypassed in the event of a file copy failure.
;  298          0297  1 !
;  299          0298  1 !--
;  300          0299  1
;  301          0300  1 !       NOTE:  This module contains some temporary code that (1) circumvents
;  302          0301  1 !       a system problem or (2) cannot be implemented until an expected
;  303          0302  1 !       system function is available.  In some cases, codes have been added;
;  304          0303  1 !       in other cases, code has been "commented out".  In either case, each
;  305          0304  1 !       statement affected includes a comment of the form "!#n", where "n" is
;  306          0305  1 !       a number from the following table:
;  307          0306  1 !
;  308          0307  1 !               #1 - symbol not currently defined in STARLET.L32
;  309          0308  1 !               #2 - I/O buffers cannot be locked in working set - known restriction
;  310          0309  1 !               #3 - MODIFY does not accept FHC XAB - future feature
