0031      C      AUTHOR: Elliott A. Drayton      CREATION DATE: 27-Jan-1983
0032      C
0033      C      Functional description:
0034      C
0035      C      This is the initialization module for the loadable image ERFDISK.EXE.
0036      C      After ERFDISK has been loaded this routine is called to return
0037      C      the information from it tables. These tables specify which error
0038      C      log packets this loadable image will process. The tables consist of:
0039      C
0040      C      ENTRY TYPE, DEVICE CLASS, MODULE VERSION, TRANSFER VECTOR OFFSET
0041      C
0042      C      The ENTRY TYPE value is the packet type identifier for the packets that
0043      C      this loadable image will process.
0044      C
0045      C      The DEVICE CLASS value specifies the class of the packet that will
0046      C      be process by this loadable image.
0047      C
0048      C      The MODULE VERSION is used to determine if the module in this image
0049      C      is the one to use. This is accomplished by the root image comparing
0050      C      this value against the value in the master tables in the root image.
0051      C
0052      C      The TRANSFER VECTOR OFFSET is the index to the transfer vector to
0053      C      be used for a specific device or entry type. For example, the transfer
0054      C      vectors for the disk image are ordered as:
0055      C
0056      C      INITDISK 0      ! a routine similar to this one
0057      C      MASSDISK 1     ! a device specific routine
