186      1175
187      1176
188      1177      2 CH$FILL (0, ITM_LENGTH, ITEMLIST);
189      1178
190      1179      2 ! Get UCB and VCB addresses for the spooled device.
191      1180
192      1181
193      1182      2 UCB = .IO PACKET[IRPSL_MEDIA];
194      1183      2 VCB = .UCB[UCBSL_VCB];
195      1184
196      1185      2 ! Point the first item at the queue name in the spooled device's VCB.
197      1186      2 ! This might be a little racy in that we could become unscheduled and
198      1187      2 ! the device set non-spooled or changed before the sndjbc service gets
199      1188      2 ! a chance to look at it, but that should be no more harmful than if
200      1189      2 ! we copied it off to local storage and it changed before the service
201      1190      2 ! executed anyway. At worst the VCB gets deallocated and some garbage
202      1191      2 ! is picked up for the name. BFD.
203      1192
204      1193
205      1194      2 ITEMLIST [ITM_QNAMSIZ] = .VCB [VCBSB_QNAMECNT];
206      1195      2 ITEMLIST [ITM_QNAMCODE] = SJCS_QUEUE;
207      1196      2 ITEMLIST [ITM_QNAMADDR] = VCB [VCBSB_QNAMECNT] + 1;
208      1197
209      1198      2 ! Fill in the file identification string.
210      1199      2 ! "Normal" callers of this service supply only the counted device
211      1200      2 ! string, the file ID and the directory ID. The service then performs
212      1201      2 ! an access function on that file to recover other information it needs
213      1202      2 ! in a trustworthy manner.
214      1203      2 ! However, we ARE the file system, and therefore can be trusted. Also,
215      1204      2 ! an attempt to call us back recursively with an access function just
216      1205      2 ! flat out will not work, because we'll be sitting here waiting for the
217      1206      2 ! SNDJBC service to finish.
218      1207      2 ! Therefore, we will also put the end of file block, access mask,
219      1208      2 ! and expanded file spec in this string also. SNDJBC will look at it
220      1209      2 ! because we are calling from exec mode or better and use this info
221      1210      2 ! rather than doing an access function on the file.
222      1211
223      1212
224      1213      2 ! First get the counted device string. Leave the trailing ":" on
225      1214      2 ! the string for now, because we'll want it a little later when
226      1215      2 ! the full file name string is built.
227      1216
228      1217
229      1218      2 IOC$CVT_DEVNAM (15, FILEINFO_STR [1],
230      1219          .CURRENT_UCB, 0; LENGTH);
231      1220      2 FILEINFO_STR [0] = .LENGTH;

```

```

232 1221 2
233 1222 2
234 1223 2 ! Pick up the file ID from the FCB instead of the file header
235 1224 2 ! because the RVN has already been normalized in the FCB, i.e.,
236 1225 2 ! APPLY_RVN has already been called.
237 1226 2
238 1227 2
239 1228 2 CH$COPY (FID$C_LENGTH, FCB[FCB$W_FID], 0, 2*FID$C_LENGTH, FILEINFO_STR [16]);
240 1229 2
241 1230 2 ! Next is the end of file block for the file.
242 1231 2
243 1232 2
244 1233 2 (FILEINFO_STR [28])<0,32> = ROT (.BBLOCK[HEADER[FH2$W_RECATTR],FAT$E_FBLK], 16);

249 1238 2
250 1239 2 ! File access mask (everything allowed).
251 1240 2
252 1241 2
253 1242 2 (FILEINFO_STR [32])<0,32> = %X'FFFFFFFF';
254 1243 2
255 1244 2 ! Build an expanded file name string including the device, null directory
256 1245 2 ! spec, and the file name.
257 1246 2
258 1247 2
259 1248 2 P = CH$MOVE (.FILEINFO_STR [0], FILEINFO_STR [1], FILEINFO_STR [38]);
260 1249 2
261 1250 2 ! Now that the entire device spec has been copied, adjust the count
262 1251 2 ! on the first string to drop the trailing ':', just like RMS does
263 1252 2 ! for the DVI field in the NAM block.
264 1253 2
265 1254 2
266 1255 2 FILEINFO_STR [0] = .FILEINFO_STR [0] - 1;
267 1256 2
268 1257 2 ! Add in null directory spec.
269 1258 2
270 1259 2
271 1260 2 (.P)<0,16> = '[';
272 1261 2 P = .P + 2;
273 1262 2
274 1263 2 ! Now pick up the file name from the ident area in the header.
275 1264 2
276 1265 2
277 1266 2 IDENT_AREA = .HEADER + .HEADER[FH2$B_IDOFFSET] * 2;
278 1267 2
279 1268 2 P = CH$MOVE (F12$S_FILENAME, IDENT_AREA [F12$T_FILENAME], .P);
280 1269 2 P = CH$MOVE (F12$S_FILENAMEEXT, IDENT_AREA [F12$T_FILENAMEEXT], .P);
281 1270 2
282 1271 2 ! Find the end of the filename. It is delimited by the space character
283 1272 2 ! if less than the full filename size.
284 1273 2 ! Turns out that the maximum legal filename is 39 + 1 + 39 + 1 + 5, or
285 1274 2 ! 85, whereas the filename plus filenameext add up to 86.
286 1275 2 ! Scan for 85 characters from the beginning of the concatenated filename.
287 1276 2 ! Set P back to the beginning of the string we just copied and scan.
288 1277 2 ! Using P as the second output argument causes it to get the address

```

```

289 1278 2 ! of the located space character after the locc executes, which will
290 1279 2 ! either be at the space character, if found, or at the 86'th byte.
291 1280 2
292 1281 2
293 1282 2 LOCC (%REF(' '), %REF (85), (.P - FI2$$_FILENAME - FI2$$_FILENAMEEXT) ; .P);
294 1283 2
295 1284 2 ! We skipped filling in the size field at byte 36 in this string so
296 1285 2 ! get it now. The filename string started at byte 38.
297 1286 2
298 1287 2 (FILEINFO_STR [36])<0,16> = .P - FILEINFO_STR [38];
299 1288 2
300 1289 2 ! Set up the item list entry for the file information string.
301 1290 2

The page contains a grid of approximately 10 columns and 15 rows of small, faint text-based listings. Each listing appears to be a system log or diagnostic output, with various headers and data fields. The text is mostly illegible due to the low contrast and resolution of the scan. Some prominent headers are visible, such as 'SCHFCB LIS', 'SND5MB LIS', 'SHFDLR LIS', 'SNDERL LIS', 'TRUNC LIS', 'FAL', 'FAL MAP', 'SELVOL LIS', 'DAPDEF MOL', 'SMALOC LIS', 'SNOBAD LIS', 'SWTUL LIS', and 'WTURN LIS'. The listings likely represent different components or modules of the VAX/VMS operating system.
