 FACILITY: NETWORK ACP

ABSTRACT: This module contains miscellaneous definitions used throughout
 NETACP.

AUTHOR: Alan D. Eldridge, CREATION DATE: 13-APR-1979

MODIFIED BY:

V011	RNG0011	Rod Gamache	18-Jun-1984
	Add NET\$V_LOGDBR flag to NET\$GL_FLAGS that indicates a data base entry needs to have counters logged.		
V010	RNG0010	Rod Gamache	23-Feb-1984
	Add constants for ACP activity timer and AQB work queue entry count.		
V009	TMH0009	Tim Halvorsen	18-Mar-1983
	Increase maximum size of route header by 7 to allow for Routing Layer padding.		
V008	TMH0008	Tim Halvorsen	14-Feb-1983
	Increase maximum size of route header by 1.		
V007	TMH0007	Tim Halvorsen	01-Dec-1982
	Increase symbol which defines the maximum size of a transport header, since Phase IV transport headers are		

now larger.
Remove several unused symbols.

V006 TMH0006 Tim Halvorsen 13-Oct-1982
Add symbols for area routing support.

V005 TMH0005 Tim Halvorsen 01-Jul-1982
Add Phase IV routing constants.
Increase maximum number of nodes to 1024 for Phase IV,
which increases the size of the NDI vector, CHM, MIN_C_H.

V004 TMH0004 Tim Halvorsen 25-Mar-1982
Remove obsolete and unreferenced symbols NET\$C_MAXCNFSIZ,
TR\$C_PH2_RTHDR and CNF\$C_TYPE.

V02-03 ADE0003 A.Eldridge 31-Dec-1981
Delete the obsolete TR\$REQXMT and TR\$CANCEL function codes.

V02-02 ADE0002 A.Eldridge 31-Dec-1981
Increased VMS limit on the maximum object name from 8 to 12.

V02-01 ADE0001 A.Eldridge 20-Dec-1981
Updated the \$NETSYMDEF macro to include NET\$V_TIMER.

.MACRO \$NETSYMDEF

\$DEFINI

```

$VIELD NET,0,<-
    <SETQIO,,M>,-
    <LOGDBR,,M>,-
    <CLRcnt,,M>,-
    <DELETE,,M>,-
    <TIMER,,M>,-
    <RQIRP,,M>,-
    <UTLBUF,,M>,-
    <NOWRT_P4,,M>,-
    -
    <BYPASS,,M>,-
    <INTRNL,,M>,-
    <READ,,M>,-
    <CNFLCK,,M>,-
    -
    <OVFLW,,M>,-
    <sp2,,M>,-
    <PURGE,,M>-

```

: Define NET\$GL_FLAGS bits

: Set if processing SET \$QIO

: Set to log data base entry re-used

: Set to clear counters after read

: Set to detect "delete" QIO processing

: Processing is due to timer dispatching

: Requeue IRP to driver

: Utility buffer is in use

: Set if the P4 ABD buffer is not to be written back to user space

: Set if QIO user has "bypass" privilege

: Set if CNF access is for ACPs internal use

: Set if CNF access is for read

: Set if conditionally writeable fields in current CNF may not be written

: Control QIO overflowed buffer

: reserved for future use

: Set if database needs to be purged of all entries marked for delete.

\$DEFEND

```

CNFS_ADVANCE = 0
CNFS_TAKE_PREV = 1
CNFS_QUIT = 2
CNFS_TAKE_CURR = 3

```

: These scanner function codes should go in the mdl file

```

NETSC_MAXACFLD = 39
NETSC_MAXNODNAM = 6
NETSC_MAXLINNAM = 15
NETSC_MAXOBJNAM = 12
NETSC_MAX_OBJ = 255
NETSC_MAX_NCB = 110
NETSC_MINBUFSIZ = 192

```

: Max individual access field length

: Max length of nodename

: Max length of linename

: Max length of object name (VMS maximum)

: Max object number value

: Max size of an NCB

: Minimum allowed buffer size. A maximum sized NSP CI message is 190 bytes including the route-header. 192 was chosen since its close to 190 and was the minimum allowed for version 1 of DECnet-VAX

```

TRSC_MAXHDR = 21+7

```

: Max Transport route header (Phase IV)

: (allow for 7 bytes padding)

```

NSPSC_MAXHDR = 9

```

: Max overhead in NSP data message header

```

NETSC_TRCTL_OVR = 5
NETSC_TRCTL_CEL = 2

```

: Phase III Transport geometry message header size

: Phase III Transport geometry message field size for each node

```

NETSC_IPL = 8

```

: NETDRIVER IPL

```

NETSC_MAXLNK = 1023

```

: Max logical link index value (must be

```

NETSM_MAXLNKMSK = 1023      ; all 1's since its used as a mask)
                           ; Synonym for NETSC_MAXLNK
NSPSC_EXT_LNK   = 30       ; Number of extra logical link slots used to
                           ; prevent the same link index to be reused to
                           ; quickly when the current link count is near
                           ; the maximum allowed link count

NETSC_MAX_NODES = 1023     ; Max allowed node address (VMS limit)
NETSC_MAX_AREAS = 63       ; Max allowed area address (VMS limit)

```

States:

The following states control the ACP transitions.

```
$EQUList ACPSC_STA_.,0,1,<-
```

```

<I>    -; Initializing All connects are allowed
<N>    -; On           All connects are allowed
<R>    -; Restricted  Connect initiates only
<S>    -; Shut       Soft shutdown, no new links allowed. Dismount
                           when the last link disconnects.
<F>    -; Off        Hard shutdown, break all links, clear all data
                           links, dismount.
<H>    -; Hibernate  The ACP is permanently hibernating to avoid a
                           bugcheck. A message is printed to reboot.

```
