36 0036 1 FACILITY:      DECnet Network Management Listener (NML)
37 0037 1
38 0038 1 ABSTRACT:
39 0039 1
40 0040 1     This module contains routines which manage the node permanent database
41 0041 1     files used by network management. This file contains permanent data
42 0042 1     about the configuration of nodes in the network.
43 0043 1
44 0044 1     When AREA support was added to DECnet, the node database grew to a
45 0045 1     size that made the old database too slow (a SHOW NODE FOO searched
46 0046 1     through the database reading one record at a time, until FOO was
47 0047 1     found. This module was created to use a four keyed file that
48 0048 1     allows single $GETs and $PUTs for each node, which is much faster.
49 0049 1     All other entities permanent databases have been left in the old
50 0050 1     format.
51 0051 1
52 0052 1 ENVIRONMENT:  VAX/VMS Operating System
53 0053 1
54 0054 1 AUTHOR:      Kathy Perko      , CREATION DATE:  6-July-1983
55 0055 1
56 0056 1 MODIFIED BY:
57 0057 1     V03-005 MKP005          Kathy Perko          2-July-1984

```

```
58 0058 1 | Fix previous fix so that PURGE KNOWN NODES works. The  
59 0059 1 | RFA is cleared when a record is deleted, so the check  
60 0060 1 | to see if the RFA has changed between passes, and the subsequent  
61 0061 1 | $GET gets an EOF. Enhance the RFA check to skip the  
62 0062 1 | $GET if the RFA is zero.  
63 0063 1 |  
64 0064 1 | V03-004 MKP0004 Kathy Perko 23-April-1984  
65 0065 1 | Change NML$READ_KNOWN_NODE_REC to save the RFA (record file  
66 0066 1 | address) in case an intermediate operation (between the  
67 0067 1 | sequential reads) moves the "next record". If the RFA  
68 0068 1 | has changed, do a $GET before reading the next node  
69 0069 1 | record.  
70 0070 1 |  
71 0071 1 | V03-003 MKP0003 Kathy Perko 31-Mar-1984  
72 0072 1 | Move the node database conversion to the upgrade module  
73 0073 1 | (NMLUPGRAD)  
74 0074 1 |  
75 0075 1 | V03-002 MKP0002 Kathy Perko 2-Mar-1984  
76 0076 1 | Fix node file create to use default name string of  
77 0077 1 | SYSS$SYSTEM:.DAT.  
78 0078 1 |  
79 0079 1 | V03-001 MKP0001 Kathy Perko 7-Feb-1984  
80 0080 1 | When converting the node database from the old format  
81 0081 1 | to the new, do the conversion to a temporary file in case  
82 0082 1 | the system crashes part way through. Rename the file to  
83 0083 1 | it's correct name when done.  
84 0084 1 |  
85 0085 1 | --

287 0283 1 %SBTTL 'nml$read_node_rec Get a Record in the Node File'
288 0284 1 GLOBAL ROUTINE nml$read_node_rec (key, key_value_dsc,
289 0285 1 node_type,
290 0286 1 buffer_dsc, data_dsc) =
291 0287 1
292 0288 1 ++
293 0289 1 FUNCTIONAL DESCRIPTION:
294 0290 1
295 0291 1 This routine performs $GETs to the node permanent database. The
296 0292 1 database is organized with one record per node, four keys per
297 0293 1 record. The four keys are:
298 0294 1 node type (executor, remote node, loop node)
299 0295 1 node address
300 0296 1 node name
301 0297 1 list node (node address concatenated with node type -
302 0298 1 used for LISTing nodes).
303 0299 1
304 0300 1 FORMAL PARAMETERS:
305 0301 1
306 0302 1 key key to use to identify the node's record.
307 0303 1 key_value_dsc Descriptor of key value to use to identify the
308 0304 1 node's record.
309 0305 1 node_type Address for returning node type key value
310 0306 1 buffer_dsc Address of a descriptor of a buffer to use
311 0307 1 data_dsc Address of a descriptor to return descriptor of data
312 0308 1 read.
313 0309 1
314 0310 1 ROUTINE VALUE:
315 0311 1 COMPLETION CODES:
316 0312 1
317 0313 1 NMA or RMS error status
318 0314 1
319 0315 1 --

383 0378 1 %SBTTL 'nml$write_node_rec Write a Record to the Node File'
384 0379 1 GLOBAL ROUTINE nm[write_node_rec (write_type, node_type, buffer_dsc) =
385 0380 1
386 0381 1 |++
387 0382 1 | FUNCTIONAL DESCRIPTION:
388 0383 1 |
389 0384 1 | This routine performs $PUTs to the node permanent database. The
390 0385 1 | database is organized with one record per node, four keys per
391 0386 1 | record. The four keys are:
392 0387 1 |     node type (executor, remote node, loop node)
393 0388 1 |     node address
394 0389 1 |     node name
395 0390 1 |     list node (node address concatenated with node type -
396 0391 1 |                 used for LISTing nodes in order by address).
397 0392 1 |
398 0393 1 | FORMAL PARAMETERS:
399 0394 1 |     write_type     nm$put_rec - do a $PUT
400 0395 1 |                   nm$update_rec - do a $UPDATE
401 0396 1 |     node_type     Node entity type - in case it's changed.
402 0397 1 |     buffer_dsc    Address of a descriptor of the buffer to write.
403 0398 1 |                   This descriptor does not include the keys - only
404 0399 1 |                   the NICE parameters.
405 0400 1 |

```

```

640 0633 3 | If the key is list node or node type, map it to the key values used
641 0634 3 | in the node database file. The value is passed to this routine as
642 0635 3 | an 'NML$C_' node entity type. The list key overlaps with the node
643 0636 3 | address key to allow the LIST command to get nodes by type and,
644 0637 3 | within type, sequentially by address. The list key value contains
645 0638 3 | a zero for the node address; hence when you do a $GET of (type OR 0)
646 0639 3 | with a match type of GTR, it will get the first node of that type
647 0640 3 | in the file. Subsequent sequential reads will return the nodes of
648 0641 3 | that type in ascending order by address.

782 0773 1 %SBTTL 'nml$read_known_node_rec Get a known Record in the Node File'
783 0774 1 GLOBAL ROUTINE nml$read_known_node_rec (node_type,
784 0775 1                                     buffer_dsc,
785 0776 1                                     data_dsc,
786 0777 1                                     rewind_flag) =
787 0778 1
788 0779 1 ++
789 0780 1 FUNCTIONAL DESCRIPTION:
790 0781 1
791 0782 1     This routine performs sequential $GETs to the node permanent
792 0783 1     database. The database is organized with one record per node.
793 0784 1     The four keys are:
794 0785 1         node type (executor, remote node, loop node)
795 0786 1         node address
796 0787 1         node name
797 0788 1         list node - node type concatenated with node address -
798 0789 1         used for LISTing nodes.
799 0790 1     If the node key and value are different from the last time
800 0791 1     this routine was called, do the $GET with a record access mode
801 0792 1     of keyed. If they are the same, do the $GET with a record access
802 0793 1     mode of sequential. The latter will cause RMS to return the
803 0794 1     next record in the file greater which matches the key and is
804 0795 1     greater than the key value. This is useful for KNOWN NODES and
805 0796 1     KNOWN LOOPNODES operations.
806 0797 1
807 0798 1 FORMAL PARAMETERS:
808 0799 1
809 0800 1     node_type      Node entity type
810 0801 1     buffer_dsc     Address of a descriptor of a buffer to use
811 0802 1     data_dsc       Address of a descriptor to return descriptor of data
812 0803 1                 read.
813 0804 1     rewind_flag    Set if the caller wants to begin reading at the
814 0805 1                 beginning of the node file.

```

```

839 0830 2 rab = nml$a_netnode_rab;
840 0831 2 key_value_dsc [0] = nm$sc_lis_key_len;
841 0832 2 key_value_dsc [1] = node_type;
842 0833 2 status = nml$_sts_suc;
843 0834 2
844 0835 2
845 0836 2 Known nodes are found using the Type and Address keys with a search type
846 0837 2 of 'greater than or equal to'. If the last operation was to a node in the
847 0838 2 middle of the type being LISTed, RMS's 'next record' will cause it to start
848 0839 2 reading node records from there. So, do a $REWIND so RMS starts at the
849 0840 2 beginning of the file.
850 0841 2 IF .rewind_flag THEN
851 0842 2 BEGIN
852 0843 2 last_RFA0 = 0;
853 0844 2 last_RFA4 = 0;
854 0845 2 status = $REWIND (RAB = .rab);
855 0846 2 END;
856 0847 2 IF .status THEN
857 0848 2 BEGIN
858 0849 2
859 0850 2 If this is the second (or later) time this routine is being called to
860 0851 2 find a node record, set up the RAB to do the next read sequentially.
861 0852 2
862 0853 2 IF NOT .rewind_flag THEN
863 0854 2 BEGIN
864 0855 2
865 0856 2 Some operations, such as LIST KNOWN NODES CHARACTERISTICS, must
866 0857 2 read random node records between the sequential operations done
867 0858 2 by this routine. For example, when listing a node which has the HOST
868 0859 2 parameter set, the HOST node's record must be read in to determine
869 0860 2 the host node's name to include in the LIST response. If the Record
870 0861 2 File Address in the RAB has moved, do a $GET to get back to where
871 0862 2 we were.
872 0863 2
873 0864 2 PURGE KNOWN NODES ALL deletes a record between each call to this
874 0865 2 routine. In this case the RFA is zeroed, so check for that too
875 0866 2 before doing the $GET.
876 0867 2
877 0868 2 IF (.last_RFA0 NEQ .rab [rab$_rfa0] OR

```

The image displays a grid of 100 terminal windows, arranged in 10 rows and 10 columns. Each window contains text-based output from a VAX/VMS system. The text is dense and includes various system messages, error codes, and diagnostic information. Some windows are more legible than others, showing titles like 'NMLPURGE LIS', 'NMLPARINI LIS', 'NMLNOOFTL LIS', 'NMLREAD LIS', 'NMLPARPRM LIS', and 'NMLPMANTP LIS'. The overall appearance is that of a multi-user terminal session or a system diagnostic tool output.
