HP 3000 Computer Systems

FUNDAMENTAL

Data Communications Handbook

The Communications Handbook (obsolete part number 30000-90105) has been restructured to make it more widely available and more readily updated. The complete handbook, the Data Communications Handbook, is now available from Computer Supplies Operation (CSO) as new part number 5957-4633. In addition, the various sections of the handbook have been made available in two ways:

- Those sections pertinent to all datacomm products, including controller, modem, CS Trace and troubleshooting guides, are now combined and expanded into a separate handbook, the *Fundamental Data Communications Handbook* (5957-4634). This handbook is included with each new HP 3000 and as such is updated under operating system and software contracts. It can be separately ordered from CSO.
- 2. The product specific sections are now provided with each product for use as quick references and as such are updated under operating system, software and manual contracts for the products. These sections can also be separately ordered from CSO, as can additional binders (P/N 9282-0683).

The FUNDAMENTAL section of the Data Communications Handbook is intended for use as a quick reference. It is not a set of product specifications. Refer to the appropriate reference manual for complete product, system, and component specifications.

PRINTING HISTORY

New editions are complete revisions of the manual. Update packages, which are issued between editions, contain additional and replacement pages to be merged into the manual by the customer. The dates on the title page change only when a new edition or a new update is published. No information is incorporated into a reprinting unless it appears as a prior update; the edition does not change when an update is incorporated.

Many product updates and fixes do not require manual changes and, conversely, manual corrections may be done without accompanying product changes. Therefore, do not expect a one to one correspondence between product updates and manual updates.

First Edition.....Jun 1984

Bit: 01234567

① An alphabetic character upshift turns bit two on.
 ② A control character turns bit one off; however, terminal software may prevent you from using a specific control character.

NOTE: ASCII is a seven bit code

ATP/ADCC/ATC DESCRIPTIONS

Asynchronous Terminal Controller (ATC)

The HP 30032B Asynchronous Terminal Controller (ATC) is an interface for bit-serial asynchronous devices (e.g., terminals, bit serial line printers, etc.). The controller can multiplex data transmission for up to 16 ports, which may be hardwired or modem connected, or any mix thereof. Supported speeds range from 110 to 2400 bps. IOTERMO interfaces the ATC hardware to the MPE operating system.

ATC Hardware Components

- HP 30032B Provides transmit and receive signals for support of data transfers for up to 16 hardwired ports.
- HP 30032B-001 Adds four signals per port for support of full duplex modem control signals for these same 16 ports.
- HP 30032B-002 Adds four additional signals for support of half duplex control signals for the same 16 ports.

With the HP 30032B, options 001 and 002, any of these 16 ports can support either direct connected devices or full or half duplex modems in any combination.

Asynchronous Data Communications Controller (ADCC)

The HP 30018 and HP 30019A Asynchronous Data Communications Controller (ADCC) is an interface for bit-serial asynchronous devices. The interface consists of an ADCC main and extend PCA which multiplexes data transmission for 8 ports which may be hardwired or modem connected or any mix thereof. Supported speeds range from 110 to 9600 bps. For MPE IV or MPE V/P, HIOTERM0 interfaces the ADCC hardware to the MPE operating system. For MPE V/E, (version 6.00.00 or later), HIOTERM2 (for terminals) and HIOASLP2 (for printers) interfaces the ADCC hardware to the MPE operating system.

Advanced Terminal Processor (ATP)

The HP 30144A, HP 30145A, and HP 30155A Advanced Terminal Processor (ATP) is an interface for bit-serial asynchronous devices. The interface consists of a System Interface Board (SIB) (30144A) and up to 8 Asynchronous Interface Boards (AIB) (30145A or 30155A). It can multiplex data for up to 96 ports which may be hardwired, modem connected, or a mix thereof. Supported speeds range from 110 to 19.2K bps. HIOTERM1 (for terminals) and HIOASLP0 (for printers) interfaces the ATP hardware to the MPE operating system.

Controller	Product Number	Driver

CONFIGURATION DIALOGUE

For further information on System Initialization and SYSDUMP, refer to the System Operation and Resource Management Reference Manual (32033-90005) for MPE V, or the System Manager/System Supervisor Reference Manual (30000-90014) and the Console Operator's Guide (30000-90013) for MPE IV and earlier, as well as the Point-to-Point Workstation I/O Reference Manual (30000-90250)

Configuring a Terminal Port

LOGICAL DEVICE #?	User choice any unique number.		
DRT #?	ATP (Series 4X/6X) calculate using this formula: (<i>imb#</i> * 128) + (<i>channel#</i> * 8)		
	ADCC (Series 3X and 4X) calculate using this formula: ((channel# * 8) + device#)		
	ATC Determined by switches or jumpers on the TERM DATA INTFL (TDI) (30032-60001). On Series II/III, the minimum DRT number is 4.		
	 7 (for first subsystem) 8, 9 (reserved for modem support) 10 (for subsecond system) 13 (for third subsystem) 16 (for fourth subsystem) 		
UNIT #?	ATP 0-95 for each subsystem. (Unit numbers 0-11 for the ATP correspond to ports 0-11 on AIB0, unit numbers 12-23 correspond to ports 0-11 on AIB1, and so on.)		
	ADCC 0 for all ports on each system		
	ATC 0-15 for each system		
SOFTWARE CHANNEL #?	<u>o</u>		
TYPE?	<u>16</u>		
SUBTYPE?	ATP 0,1,9 For MPE V/E, any invalid subtypes entered map to subtype 0.		
	ADCC 0,1,2,3,4,5 For MPE V/E, subtype 4 maps to 0, and subtype 5 maps to 1.		
	ATC 0,1,2,3,4,5,6,7		
	Refer to Tables 2-3 and 2-4 for subtype definitions. For subtypes 4, 5, 6,		

and 7, you must also configure a port line speed (refer to Table 2-2).

Asynchronous Controllers and Modems

TERM TYPE?

MPE IV or MPE V/P TERM TYPE? for MPE V/E ENTER [TERM TYPE#],[DESCRIPTOR FILENAME]? ATP 6,9,10,12,13,15,16,18,31

ADCC 4,6,9,10,12,13,15,16,18,31

ATC 0,1,2,3,4,5,6,9,10,12,13,15,16,18,31

See also Tables 2-8 through 13 for Terminal Type Characteristics. ATP and ADCC (HIOTERM2) allow you to specify a user-created terminal type by entering the fully qualified filename in addition to or instead of the terminal type number. Refer to the *Workstation Configurator Reference Manual* (30239-90001) for more information.

SPEED IN CPS? The following speeds are supported by controllers:

TABLE 2-2. LINE SPEEDS SUPPORTED FOR ATP, ADCC, and ATC

Line Speed	Chars/ Sec	ATP sensed	ADCC HIOTERM2 sensed/specified	ADCC HIOTERM0 sensed/specified	ATC sensed/specified
110	10	γ	N / N	N / N	Y / Y
150	15	N	N / Y	Y / Y	Y / Y
300	30	Y	Y / Y	Y / Y	Y / Y
600	60	Y	Y / Y	N/Y	Y / Y
1200	120	Y	Y / Y	Y / Y	Y / Y
2400	240	Y	Y / Y	Y / Y	Y / Y
4800	480	Y	Y / Y	N / Y	N / N
9600	960	Y	Y / Y	N/Y	N / N
19200	1920	Y	N / N	N / N	N / N

RECORD WIDTH?	User choice. Usually 40 words (or 80 bytes), the screen width of most terminals.
OUTPUT DEVICE?	<u>ldev#</u>
ACCEPT JOBS/SESSIONS?	$\underline{YES} \text{ (logon terminals) } \underline{NO} \text{ (still allows programmatic opening of the terminal)}$
ACCEPT DATA?	<u>YES</u> (if you wish to use the :DATA command) or \underline{NO}
INTERACTIVE?	YES (allows : HELLO, : (command), or: JOB commands) or NO
DUPLICATIVE?	\underline{YES} (output is echoed character-by-character, rather than line-by-line).
INITIALLY SPOOLED?	NO
DRIVER NAME?	ATP HIOTERM1
	ADCC HIOTERM0 (MPE IV or V/P) / HIOTERM2 (MPE V/E)
	ATC IOTERM0
DEVICE CLASSES?

User choice. The console must be unique and must be device class CONSOLE.

NOTE : The following prompt appears only in the SYSDUMP dialog, and only if you respond YES to the SYSTEM TABLE CHANGES? prompt.

TERMINAL BUFFERS PER 1 - 12PORT?

Recommended:

ATP and ADCC (HIOTERM2) 3 per port. Software guarantees that a minimum number of buffers are configured.

ADCC (HIOTERM0) 5 per port, minimum of 30 buffers

ATC 8 per port, minimum of 40 buffers

If heavy use is made of block mode I/O, or many printers are operated concurrently, or large reads (>1000 characters) are common, then 12 buffers per port should be configured on all systems.

Terminal Buffers

ATP (HIOTERM1 or HIOASLP0). The TBUFs are in an extra data segment called the Terminal Data Segment. There is one data segment built for units 0-47, and another for units 48-95. The maximum number of TBUFs is determined by the configured "Maximum Extra Data Segment Size" and the number of data segment used. The following formula finds the maximum number of TBUFs per data segment of a given size:

$$\left(mcseg - \left(2023 + (\# of ports * 184) \right) \right) / 69$$

where:

mcseg = Maximum Extra Data Segment Size

2023 = Fixed ATP overhead

184 = Size of an ATP Device Information Table (DIT) contained in the XDS

69 = The number of words in an ATP TBUF

ADCC (HIOTERM2 or HIOASLP2). The TBUFs are contained in an extra data segment. Only one extra data segment is constructed, however. The formula for calculating the maximum number of TBUFs is:

$$\left(mxseg - \left(1775 + (\# of ports * 210) \right) \right) / 69$$

where:

maseg = Maximum Extra Data Segment Size

1775 = Fixed ADCC (HIOTERM2) overhead

210 = Size of an ADCC DIT contained in the XDS

69 = The number of words in an ADCC (HIOTERM2) TBUF

If more TBUFs are configured than can fit in an extra data segment, the system builds as many as possible and prints a warning message each time the system is warmstarted or coolstarted. If more TBUFs are needed, the configured "Maximum Extra Data Segment" size may be increased.

ADCC (HIOTERMO) and ATC. The maximum number of TBUFs that can be configured is 255. They are located in Bank 0.

Subtype	Description
0	Directly connected terminals requiring speed sensing. Not recommended for use with modems.
1	Asynchronous full duplex modems. Compatible with Bell 103, 202T, 212A, and CCITT V. 21 modems requiring speed sensing. ATP and ADCC (HIOTERM2) require Data Set Ready (RS-232-C "CC", CCITT 107) and Data Carrier Detect (RS-232-C "CF", CCITT 109) to be ON.
2	Asynchronous half duplex modems with reverse channels (such as Bell 2025 and CCITT V. 23 modems). Speed sensing is performed and "Data Rate Select" (RS232C "CH"-CCITT 111) is set ON. Not available on HP 4X/6X. "Data Set Ready" and "Data Carrier Detect" on the ADCC must be set ON.
3	Identical to subtype 2 except that "Data Rate Select" is set OFF. Not available on HP 4X/6X. "Data Set Ready" and "Data Carrier Detect" on the ADCC is set ON.
9	ATP only - Asynchronous CCITT modem that requires monitoring circuit 108; clear to send, otherwise identical to subtype 1.

TABLE 2-3. SPEED SENSING TERMINAL SUBTYPES

TABLE 2-4. SPEED SPECIFIED TERMINAL SUBTYPES

Subtype	Description
4	Identical to subtype 0 except that automatic speed sensing is disabled. This subtype is intended for operation with leased-line full duplex modems which can be configured to operate without control signals (i.e., 202T). (Not supported for MPE V/E).
5	Identical to subtype 1 except that automatic speed sensing is disabled. (Not supported for MPE V/E).
6	Identical to subtype 2 except that automatic speed sensing is disabled. Series II/II only.
7	Identical to subtype 3 except that automatic speed sensing is disabled. Series II/III only.

Configuring a Printer Port

LOGICAL DEVICE# ?	User choice				
DRT# ?	ATP (Series 6X) calculate using this formula: (<i>imb#</i> * 128) + (<i>channel#</i> * 8) + <i>device#</i>				
	ATP (Series 4X) calculate using this formula: (channel# * 8)				
	ADCC (Series 3X and 4X) calculate using this formula: (channel# * 8) + device#				
	ATC Refer to terminal configuration.				
UNIT# ?	ATP 0-95 for each subsystem. (Unit numbers 0-11 for the ATP correspond to ports 0-11 on AIB0, unit numbers 12-23 correspond to ports 0-11 on AIB1, and so on.)				
	ADCC 0 for all ports on each system				
	ATC 0-15 for each system				
SOFTWARE CHANNEL# ?	<u>0</u>				
TYPE?	<u>32</u>				
SUBTYPE?	<u>14</u> or <u>15</u>				
	14 = Speed-specified, direct connect. May be used with full duplex leased line modems not requiring any control signals, such as 202T.				
	15 = Speed-specified, modem connect. Use with full duplex modems requiring the following control signals: CC, CF.				
TERM TYPE?	MPE IV or V/P TERM TYPE? for MPE V/E ENTER [TERM TYPE #],[DESCRIPTOR FILENAME]?				
	ATP and ADCC (HIOASLP2) 19, 20, 21, 22				
	You can specify a user-created terminal type by entering the fully qualified filename in addition to or instead of the terminal type number. Refer to the <i>Workstation Configurator Reference Manual</i> (30239-90001) for more information.				

ADCC (HIOTERMO) and ATC allows 19 only.

Status Request Protocol

For terminal types 19 (7-bit) and 20 (8-bit): The software driver asks for the status of the printer before printer initialization, at every FOPEN to the printer, at the end of every FWRITE record, and when the printer issues an XOFF(dc3). This is called a Status Request (esc?dc1). If the printer responds to this request by telling the computer that it is in trouble (paper jam, out of paper, etc.), a message is sent to the console telling the operator what is wrong with the printer. These terminal types are recommended for remote spooled printers as well as local spooled printers and non-spooled printers.

For terminal types 21 (7-bit) and 22(8-bit): A status request is sent to the printer before printer initialization, at every FOPEN to the printer, and after every carriage control (CR-LF or FF). Error messages are sent to the console if the printer is in trouble, but since status is checked less frequently than with termtypes 19 and 20, a problem may not be detected as quickly. These terminal types are recommended for local spooled printers but are not recommended.

Some application printers (printers that are not compatible with 2631B) are configured using terminal type 18. Since Status Request Protocol is not used with this terminal type, the driver has no way of knowing when something has gone wrong with the printer. The application that controls the printer must read the printer's status or data may be lost. Consult the documentation of the application to see whether or not the application reads the printer's status.

SPEED IN CHARACTERS PER SECOND? Printer ports are not speed-sensed. The line speed must correspond to the printer's configured speed. The following speeds are supported by the controllers:

Line Speed	Chars/Sec	АТР	ADCC	ATC
110	10	·γ	N	Y
150	15	N	Y	Ϋ́Υ
300	30	Y	Y	Ŷ
600	60	Y	Y	Ŷ
1200	120	Ϋ́Υ	Y	Y
2400	240	Y '	Ŷ	Y
4800	480	Y	Y	N
9600	960	Υ	Y	N
19200	1920	Ŷ	N	N

TABLE 2-5. SUPPORTED SPEEDS FOR PRINTER PORTS

RECORD WIDTH?	User choice. Usually 66 words (132 bytes), the standard page width of most printers.
ACCEPT JOBS/SESSIONS	NO
ACCEPT DATA?	NO
INTERACTIVE?	NO
DUPLICATIVE?	NO
INITIALLY SPOOLED?	<u>YES</u> or <u>NO</u>
	Yes, if you want the system to automatically spool the device at system startup time.
	No, if you want programmatic control, however, you will need to initially spool the device yourself with :STARTSPOOL.
DRIVER NAME?	ATP HIOASLP0
	ADCC HIOTERM0 (MPE IV or V/P) / HIOASLP2 (MPE V/E)
	ATC IOTERM0
DEVICE CLASS?	User choice.
	NOTE : The following prompt appears only in the SYSDUMP dialog, and only if you respond YES to the SYSTEM TABLE CHANGES? prompt.
IO QUEUE=XXX?	If you are planning to run multiple synchronous printers simultaneously, it is recommended the value be increased to the maximum, usually 255.
TERMINAL BUFFERS PER PORT?	<u>1</u> - <u>12</u>
	Recommendations:
	ATP and ADCC (HIOTERM2) 3 per port. Software guarantees that a minimum number of buffers are configured.
	ADCC (HIOTERMO) 5 per port, minimum of 30 buffers.
	ATC 8 per port, minimum of 40 buffers.

If heavy use is made of block mode I/O, or many printers are operated concurrently, or large reads (>1000 characters) are common, then 12 buffers per port should be configured on all systems. (Refer to "Terminal Buffers" earlier in this section.)

ATP, ADCC, and ATC COMPARISON

Each HP 3000 environment (whether it is hardware or software) has its restrictions and advantages that must be considered when you are going from one HP 3000 environment to another. A comparison of the differences between the three asynchronous interfaces available in the HP 3000 family of computers is listed below.

	ATP ADCC (MPE V/E)	ADCC (MPE IV or MPE V/P)	ATC
Terminal Type	6, 9, 10, 12, 13, 15, 16, 18	4, 6, 9, 10, 12, 13, 15, 16, 18, 19, 31	0-6, 9, 10, 12, 13, 15, 16, 18, 19, 31
Printer Terminal Types	19, 21 (7-bit) and 20, 22 (8-bit)	19 (7-bit only)	19 (7-bit only)
Terminal Subtypes	0, 1, 9 (eliminates all speed-specified and half-duplex devices)	For Series 30/33 - 0-5 (eliminates all speed-specified and half-duplex devices). For Series 39/4X - 0, 1, 4, 5 (eliminates all half duplex devices).	0 - 7: speed-sensed and speed-specified devices supported for direct or modem connect and for both full and half duplex.
Printer Subtyp e s	14 (direct) and 15 (modem) for printers that support Status Request protocol.	14 (direct) and 15 (modem) for printers that support Status Request protocol.	14 (direct) and 15 (modem) for printers that support Status Request protocol.
Paper Tape Mode	Paper Tape Mode is not supported.	Paper Tape Mode is not supported.	It is supported under Terminal Type 6.
Delay Character Requirements	Terminal Types 5 and 6 provide a delay of 0.3 seconds after the CR, LF and/or FF. Terminal Type 9 provides a delay of 0.3 for LF and FF, none for CR. ADCC will use the NULL character for delays.	The NULL character is used for delays (that is, the start bit is followed by seven zeros and the appropriate parity bit). See Table 2-7A for the number of nulls sent per CR or LF, and TABLE 2-7C for the number of nulls sent per FF.	Delays are used after CR, LF, and/or FF with the datacomm line held in the mark condition. See Table 2-7B for the number of nulls sent per CR or LF, and TABLE 2-7C for the number of nulls sent per FF.

TABLE 2-6. COMPARISON OF ASYNCHRONOUS CONTROLLERS

2-12

	ATP ADCC (MPE V/E)	ADCC (MPE IV or MPE V/P)	ATC	
Initial Speed and Parity Sensing	Performed by the hardware, up to 19200 bps (ATP) or 9600 bps (ADCC), resulting in a line speed and generation of even parity or the use of 8-bit pass-through (no parity checking).	Performed by software, up to 2400 bps, resulting in a line speed and generation of even parity or the use of 8-bit pass-through (no parity checking).	Performed by hardware, up to 2400 bps, resulting in a line speed and generation of either even or odd parity.	
Parity Control	The 8th output bit can be set (via FCONTROL logic) to odd or even parity, or to 8-bit pass-through.	The 8th output bit can be set (via FCONTROL logic) to odd or even parity, or to 8-bit pass-through.	The 8th output bit can set (via FCONTROL logic) to odd or even parity, to 8-bit pass-through, or forced to 1.	
Input Character Handling (7-Bit)	The 8th input bit is passed through in standard and unedited modes with parity disabled. With parity enabled, it is both checked and generated.	The 8th input bit is passed through in standard and unedited modes with parity disabled. With parity enabled, it is both checked and generated.	The 8th input bit is forced to zero in standard and unedited modes with parity disabled. When parity is enabled, it can be set to either generate and check parity or generate but NOT check parity.	
XON/XOFF Handshake	XON/XOFF characters are never ignored.	When a write is not posted to the driver, XON/XOFF characters are ignored.	XON/XOFF characters are never ignored.

TERMINAL TYPE CHARACTERISTICS

The terminal type is a set of characteristics that define much of the relationship between your device and the controller. Each controller supports a subset of the terminal types available (refer to Table 2-8). Tables 2-9 through 11 show the terminal types and their characteristics for each asynchronous controller. All of the terminal types available and their associated characteristics are shown in Table 2-12.

The terminal types supported for each controller are:

Controller	Device Type 16	Device Type 32
ATP and ADCC (MPE V/E)	6,9,10,12,13,15,16,18,31 or user-created	19,20,21,22 or user-created
ADCC (MPE IV or V/P)	4,6,9,10,12,13,15,16,18,31	19
АТС	0,1,2,3,4,5,6,9,10,12,13, 15,16,18,31	19

TABLE 2-8. SUPPORTED TERMINAL TYPES

Characteristics Terminal Types 10 12 13 Page-block mode data transfers supported. Formfeed characters changed to linefeed. (ESCAPE): enables echo; (ESCAPE); disables echo. 6 9 10 12 13 15 16 18 (CONTROL)T dumps the input buffer to the device. **Data Flow Control Characteristics Terminal Types** ENQ/ACK Protocol: 10 12 15 16 ENQ and ACK used as the protocol characters. 10 12 15 16 Blocks of 80 characters between ENQ's ENQ/ACK timeout is 10 seconds. 10 12 15 16 **ENO/ACK** Timeout Actions: 10 12 Send more data. Send ENQ; restart timer. 15 16 Report timeout to console. Delay issued after each Carriage Return, 6 9 Linefeed, or Formfeed. 6 9 10 12 13 15 16 18 19 20 21 22 XON/XOFF protocol enabled. Action upon receipt of XOFF: 6 9 10 12 13 15 16 18 Wait indefinitely. 19 20 Perform serial printer status request and act upon response. 21 22 Start XON/XOFF timer; notify console if it expires. 19 Before each write is completed, device status is requested to ensure that the data is received without error.

TABLE 2-12. TERMINAL TYPE CHARACTERISTICS (cont'd)

INPUT MODES AND TERMINAL EDITING

Commands and data can be input to the computer in Character Mode or in Block Mode. The significant differences between Character Mode and Block Mode are summarized in Table 2-13. Record Separator or Group Separator are those characters typically defined by software to be End-of-Record characters in page block mode.

Feature	Character Mode	Page Block Mode
Standard End-of-Record Character	Carriage Return	Record Separator or Group Separator for HP Terminals
EOR Character with Transparent Editing	Character Defined in FCONTROL (25) and in FCONTROL (41).	Record Separator or Group Separator for HP Terminals
Pacing Methods	Input: DC1-data. Output: ENQ/ACK XON/XOFF	Input: (DC1-DC2-DC1)-data Output: ENQ/ACK XON/XOFF
Echo Facility	Full-Duplex: Enabled Half-Duplex: Disabled	Disabled
System Break	OK to Use	Should not be used. When the computer sees a break, it assumes the terminal is operating in Character Mode.
Subsystem Break	OK to Use	Should be used at the end of the data. If it is used in the middle of the data, it can cause the data to overrun the interface.

TABLE 2-13. COMPARISON OF CHARACTER AND BLOCK MODES

Standard Editing

In Character Mode, all of the keys listed in Table 2-14 can be used in terminal editing. However, do not include any of the editing characters in the input data stream when using input devices with speeds greater than 20 characters per second (independent of line speed) and note that AUTO LF can only be used with MPE V/E (version 6.00.00 or later) systems.

In Block Mode, all of the HP terminal editing keys can be used when preparing data for input. However, avoid embedding control characters within the data. Because bursts of data are sent to the computer, the interface frequently does not have time to interpret and respond to control characters embedded within the data, with resulting data overruns and I/O errors. The interface may be able to process one or two characters at the end of the data.

For both Character and Block Modes, do not transmit long strings of special characters with function keys. Avoid programming type N or T function keys with either a high density of special characters in a given string or more than two special characters in a row. This could cause data overruns and an I/O error.

Key	Function
(backspace) or (<u>control</u>)H	Deletes previous character from the current input line. The response of the terminal depends on the TermType and the type of terminal. HP264x and HP262x terminals connected to the port with the TermType 10 backspace the cursor once each time the key is pressed.
(BREAK)	Requests system break, suspending current program and returning control to MPE. Will cause loss of some data if program is writing to terminal at the same time as the (BREAK) is pressed.
(CONTROL) A	On the system console, or where console has been moved (logical console) via the :CONSOLE command, it indicates that a console command follows.
(CONTROL)F (ACK)	The Acknowledge character for the Enquiry/Acknowledge handshake. HP terminals transmit it automatically.
(CONTROL)Q (DC1 or XON)	Causes the writing of output to the terminal to be resumed (after its suspension by (CONTROL)S).
(<u>CONTROL</u>)R (DC2)	Significant for terminals with Block Mode, only. Indicates that the terminal is ready to transmit a block of data. HP terminals strapped for Page Block Mode operation automatically send a DC2 when ENTER is pressed (or when RETURN), defined as the ENTER key, is pressed).
(<u>CONTROL</u>)S (DC3 or XOFF)	Causes writing of output to the terminal to be suspended. $((CONTROL)Q$ used to resume.)

TABLE 2-14. SPECIAL CONTROL FUNCTIONS--STANDARD EDITING

Key	Function
(CONTROL)X	Deletes all of current line being typed. The computer sends three exclamation points (!!!), followed by a Carriage Return and a Line Feed.
	You may enter a new line after deleting the old line.
(<u>Control</u>)Y	Requests a subsystem break. (Use during execution of some part of a program to halt that execution and obtain a program prompt.) ATC only. If your terminal is in Tape Mode, <u>CONTROL</u> Y returns it to Normal Mode.
LINEFEED (LF) or (CONTROL)J	ADCC, ATC, and ATP: For MPE V/E, on terminals with a Line Feed key, pressing the key causes the computer to write a Carriage Return.
	This facility is primarily for those terminals that do not have an automatic line wrap-around feature. When input record is longer than width of terminal line, the LF character may be included so that input will be displayed on more than one line. In this way, the overstrike of characters in the last column position of the terminal will be avoided.
(RETURN) or (CONTROL)M	Normal end-of-record character. When echoed to terminal, causes cursor or typing head to return to the beginning of the line.
(<u>CONTROL</u>)R(<u>RETURN)</u> (two character sequence)	When embedded anywhere in the input stream, this character pair and all data up to and including the CR are stripped and a DC1 ([CONTROL]Q) is written to the terminal.
ESCAPE: (two character	Causes Echo to be turned on, so characters typed at terminal are echoed back to the terminal.
sequence)	DO NOT USE while your terminal is operating in Block Mode.
(ESCAPE); (two character sequence)	Causes Echo to be turned off, so characters typed at the terminal are not echoed back to the terminal. Echo should be turned off in Block Mode.

TABLE 2-14. SPECIAL CONTROL FUNCTIONS--STANDARD EDITING (cont'd)

Binary Editing

In Binary Editing, no special characters are recognized, except [CONTROL] A on the console. All data you type in at your terminal (control characters or others) is passed by the interface to the user's Terminal Buffers. Your input is terminated by read timeout or the number of characters input, rather than by some control character (such as Carriage Return). Consult documentation on your program for more information.

Transparent Editing

Sometimes the program you are running will switch your port to Transparent Editing Mode. During Transparent Editing, all control characters except those produced by the keys listed in Table 2-15 are left in your input data stream (and hence, are not acted upon by the asynchronous interface).

Key	Function
(RETURN)	When Echo is enabled, it causes the cursor or typing head to return to the beginning of the same line. The character that indicates the end-of-record is defined programmatically. In Transparent Editing Mode, the Line Feed character is not sent to the terminal upon receipt of the Carriage Return character.
(CONTROL)F(ACK)	The Acknowledge character for the Enquiry/Acknowledge handshake, if enabled; otherwise, it is a data character.
(BREAK)	Causes a system break (when enabled) and transfers control to MPE. When :RESUME is entered, Transparent Editing is resumed.
(<u>control</u>)A	On system console, indicates that the next input will be a console command. When command execution is complete, Transparent Editing is restored.
(<u>Control</u>)q (DC1 OR XON)	The "Resume Output" character is the XON/XOFF handshake. This character is stripped from the input data.
(CONTROL)R (DC2)	When input as first character, it is stripped out. A DC1 ((CONTROL)Q) is then written to the terminal. When not input as the first character, DC2 is a data character.
(DC3 OR XOFF)	The "Halt Output" character of the XON/XOFF handshake. This character is stripped from the input data.

1

ł

TABLE 2-15. SPECIAL CONTROL FUNCTIONS--TRANSPARENT EDITING

RECOMMENDED MODEMS

Hewlett-Packard does not recommend the use of half-duplex modems. Full-duplex modems are recommended at one of the (or equivalent) speeds shown in Table 2-16.

Modem	Baud Rate Supported	Notes
BELL 103J	ATP: 110, 300 ADCC: 150, 300 ATC: 110, 150, 300	Dial-up, auto-answer.
BELL 202T	ATP: 110, 300, 600, 1200 ADCC: 300, 600, 1200 ATC: 110, 150, 300, 600, 1200	4-wire leased line. For logon at 600 baud ADCC (HIOTERM0) ports must be configured Subtype 5 (speed-specified, full duplex modem port). Also, can log on at another speed and use :SPEED command to change to 600 baud.
BELL 212A	ATP: 110, 300, 1200 ADCC: 150, 300, 1200 ATC: 110, 150, 300, 1200	Dial-up, auto-answer. Use at 1200 baud with HS (High Speed) switch on; other baud rates with HS switch off.
HP 13265A	ATP: 110, 300 ADCC: 150, 300 ATC: 110, 150, 300	Dial-up. Compatible with the Bell 103 modem.
НР 35016А	ATP: 110, 300, 1200 ADCC: 150, 300, 1200 ATC: 110, 150, 300, 1200	Dial-up. Compatible with Bell 103, 212, and Racal-Vadic VA 3400 modems. At 1200 baud, the HS switch must be on. If ordering through Racal-Vadic, use model number VP3451PA.
HP 35141A (SUPPORT LINK)	ATP: 110, 300, 1200 ADCC: 150, 300, 1200 ATC: 110, 150, 300, 1200	Auto-dial/auto-answer. Compatible with Bell 103 and 212 modems. If ordering through Racal-Vadic, use model number VP212HA.

TABLE 2-16. RECOMMENDED ASYNCHRONOUS FULL-DUPLEX MODEMS

Modems	Baud Rate Supported	Notes
HP 37212A	ATP: 110, 300, 1200 ADCC: 150, 300, 1200 ATC: 110, 150, 300, 1200	Dial-up, auto-answer. Compatible with Bell 103 and 212 modems, as well as CCITT V. 22 protocol.
HP 92205A	ATP: 110, 300, 1200 ADCC: 150, 300, 1200 ATC: 110, 150, 300, 1200	Hayes Smartmodem 1200. Auto-dial and/or auto-answer. Compatible with Bell 103 and 212 modems.
VA 3400	ATP: 1200 ADCC: 1200 ATC: 1200	Dial-up or 2-wire leased line. NOT Bell compatible.
VADIC 34XX Series	ATP: 110, 300, 1200 ADCC: 150, 300, 1200 ATC: 110, 150, 300, 1200	Several modems available, each compatible with the VA 3400 modem. Most are compatible with either or both of Bell 103 and 212 modems.

TABLE 2-16. RECOMMENDED ASYNCHRONOUS FULL-DUPLEX MODEMS (con't)

When a dial-up modem is used, the terminal operator will not be able to change the baud rate after logging on. The use of the :SPEED command with dial-up modems is not recommended.

All of these modems (in Table 2-16) pass through any parity bits they receive. Refer to the appropriate modem manuals and local telephone company for strapping information. Refer to "Modem Options" for a summary of options for HP and Bell modems.

MODEM OPTIONS

Following are the recommended asynchronous modems and options to be used in conjunction with the ATC, ADCC, and ATP. For further definition of these options/modem capabilities refer to the appropriate Hewlett-Packard or Racal-Vadic modem reference manual, or to the relevant *Bell System Technical Reference* publication that is available from your local Bell System Representative.

HP MODEMS

HP 13265A

Direct connect, full duplex, originate only modem with 300 baud rate. Compatible with Bell 103/113 modems or equivalent. Cable is a 50-pin connector for use with HP 262X terminals. For HP 264X terminals, the 02640-60239 asychronous datacomm board is required; order option 001 for the cable with a 30-pin hooded connector.

For more information, refer to the HP 13265A User's Manual (13265-90001).

HP35016A and VADIC 3451P/A

Bell Modems

Bell 103J and 113D Modems

0-300 Bits/sec, Asynchronous Full duplex on 2-wire operation Works with another 103/113 or equivalent modem, or with another 212A or equivalent modem.

TABLE 2-19. RECOMMENDED 103J/113D MODEM OPTIONS

Option	Description	Computer	Terminal
A1	Send Space Disconnect	X	X
B3	Receive Space Disconnect	X	x
C5	Loss of Carrier Disconnect	x	х
D7	Fail Safe State on CN Circuit OFF	x	х
E9	Auto Answer YES	x	

Bell 202S Modem

Asynchronous, half duplex, with Reverse Channel, in switched network applications. Speed 1200 bits per second. Not supported on an HP 3000/4X/6X.

Option	Description	Computer	Terminal
A1 A2	Local copy on primary No local copy on primary	x	X
B3 B4	Local copy on Reverse No local copy on Reverse	(Note 1)	
C5	Telephone company engineer timing options	X	X
D8	Data Set Ready Interface lead OFF in Analog loopback test mode	x	x
E9 E10	Automatic Answer IN (Note 2) Automatic Answer OUT (Note 2)	X	x
F11	Signal ground connected to Frame Ground	x	x

TABLE 2-20. RECOMMENDED 202S MODEM OPTIONS

1. If terminal has internal echo capability to provide local copy use B4, otherwise specify B3 for local copy.

2. Auto answer depends on application. Generally, the terminal is dialed manually, and the computer auto answers.

Bell 202T-L1A Modem

Asynchronous Modem, provides Self Test, Analog Loopback and Remote Test capabilities.

Generally, used with HP 3000 at 1200 bits per second; full duplex on normal 3002 channel 4-wire service (no reverse channel).

Subtype 4 is preferred for configuration without speed sense. (Subtype 0 may also be used, however, when noisy line or power failure may cause potential trouble with speed sense.)

Option	Description	Computer	Terminal
A2	No local copy on primary channel	X	X .
B4	No local copy on reverse channel	х	X
C5	Telephone company engineer timing options	х	X
D7	Telephone company engineer control options	х	x
E10	Reverse channel not installed	х	Х
F11	Signal Ground connected to Frame Ground	х	x

TABLE 2-21. RECOMMENDED 202T-L1A MODEM OPTIONS

BELL 212A Modem

0-300 bits per second asynchronous 1200 bits per second asynchronous

Compatible with 103/113 type modem at 300 bits per second, and 212 type modem at 1200 bits/second full duplex type operation.

Use subtype 1 or 5.

Option	Description	Computer	Terminal
A2	Customer selected disconnect options a. Send space disconnect b. Receive space disconnect c. Loss of carrier disconnect	IN OUT IN	OUT IN don't care
B3	Automatic Answer	YES	
C6	Customer selected EIA interface a. Data set ready (CC) indication for analog loop b. Clear to send (CB) and carrier (CF) indications c. Signal ground to frame d. Answer mode indication (CE) e. Interface speed indication f. Speed control g. Interface controlled DL h. CN & TM assignments	OFF COMMON IN OFF OUT HS OUT CN-25	OFF COMMON IN OFF OUT HS OUT CN-25
D8	Customer selected modes a. 1200 bps operation b. Character length c. Transmitter timing d. Speed mode e. Receiver responds to DL	ASYNC 10 INT DUAL OUT	ASYNC 10 INT DUAL don't care
E10	Make Busy/Analog Loop (CN) circuit disabled	OUT	OUT
F11	TELCO Option Table tip-ring make busy	don't care	IN

TABLE 2-22. RECOMMENDED 212A MODEM OPTIONS

ATP/ADCC/ATC CABLES

Whether a device is connected directly or through a modem, the connection mode determines the kind of cabling that must be used. To directly connect an RS 232 device to the ATP, ADCC, or the ATC, three wires are needed; one for a transmit line, one for a receive line, and one for a ground line. To directly connect an ATP to an RS 422 interface connection requires two wires for transmission, two for reception, and one for grounding. Modem connections require cables that conform to the Hewlett-Packard implementation of the RS-232-C, V.21 or V.23 interface standards. To ensure proper performance, be sure to consult the manuals for the equipment you are connecting via cable. Check closely the specification for the maximum cable length.

Hewlett-Packard sell cables for all supported connections (refer to Table 2-23). Consult the *Computer* User's Catalog for ordering information. Hewlett-Packard does not guarantee the proper operation of devices connected through custom-built cables.

RS-232-C Cables

Refer to Figure 2-1 for diagrams of the connectors designated as 1M, 2F, 3 (M and F), 4 (M and F), 5, 6 (M and F) and 7 (M and F). In the tables below, the cable part numbers shown first are to be used to order replacement cables. For your reference, the part numbers given below in parenthesis are the numbers used when ordering the cable as part of a new system installation.

Cable Manufacturing Specifications

The specification establishes requirements for a 3 or 25 pin conductor external low voltage unshielded computer cable with overall jacket: U.L. style 2560. The maximum length for an RS-232-C specified cable is 50 feet.

Electrical

Voltage Rating 30V for Class 2 wiring systems only (220V rms test between conductors).

Mechanical

Singles	Three or twenty-five 26 (7 x 34) AWG tinned copper; tinned after stranding.
Insulation	PVC, seven-mil minimum wall thickness; rated at +60°C.
Cable Lay	Twist singles for flexibility.
	Fillers, cloth or nylon binding may be used for a smooth, round construction.
Jacket	PVC, 35 -mil minimum wall thickness; rated at $+60^{\circ}$ C.
Color	Jade Gray per Visual Color Std., HP Part No. 6009-0021.

Figure 2-1. Diagrams of Common Cable Connectors

2-41

*Only option 001 is supported for RS-232-C distance specifications.

Figure 2-2. Point-to-Point Cable Configurations

Part Number	Length	Description
13222-60001 (13222N)	16.7 ft. (5 m)	Cable: 50-pin 1M to 25-pin 3M. Used with U. S. modems Bell 103A, 202C/D/S/T, 212A, and with Vadic 3400 signal compatible acoustic couplers. Also used with HP 1000 and HP 3000 System multiplexers.
92217A	50 ft. (1 5 m)	Longer 13222N cable.
13222-60002 (13222M)	16.7 ft. (5 m)	Cable: 50-pin 1M to 25-pin 3M. Used with European 103 or 202C type modems. Shielded.
92217B	50 ft. (1 5 m)	Longer 13222M cable.
13222-60003 (13222C)	6.6 ft. (2 m)	Cable: 50-pin 1M to 25-pin 3F. Used for standard RS-232-C communications.
92217C	50 ft. (15 m)	Longer 13222C cable.
13222-60005 (13222Y)	16.7 ft. (5 m)	Cable: 50-pin 1M to 25-pin 3M. Three-wire cable with EMP protection for terminal from lightning-induced transients.
92217E (13222X)	16.7 ft. (5 m)	Cable: 50-pin 1M to 25-pin 6M. Used as an RS-232-C interface cable for an HP 3000 Series 6X ATP.

TABLE 2-23. HP 262X or HP 125 (Both Port 1) (Not for HP 2621, 2629L, 2382A)

TABLE 2-24. MODEM CABLES

Part Number	Length	Description
30062-60020 (30062B)	25 ft. (7.6 m)	Cable, 25-pin 3M to 25-pin 3M. Connects an HP 3000 to modem types Bell 103 and 202S.
30062-60061 (30062B, Opt. 001)	50 ft. (1 5 m)	Cable, 25-pin 3M to 25-pin 3M. Connects an HP 3000 to modem types Bell 103 and 202S.
5061-2403 (13232U)	5 ft. (1.5 m)	Modem Eliminator Cable: 25-pin 3F to 25-pin 3F. Bypasses modem and connects an HP 13232P cable to an HP 1000, to an HP 3000, or to another terminal. Unshielded.

TABLE 2-25. HP 262X, HP 125 (Both Port 2), HP 2621,2629L,2382A,120,150

Part Number	Length	Description
13242-60001 (13242N)	16.7 ft. (5 m)	Cable: 25-pin 3M to 25-pin 3M. Used with HP 1000 or HP 3000 Systems, with U. S. modems Bell 103A, 202C/D/S/T, 212A, and with Vadic 3400 modems; acoustic couplers (signal compatible only). Shielded.
92218A	50 ft. (15 m)	Longer 13242N cable.
13242-60002 (13242M)	16.7 ft. (5 m)	Cable: 25-pin 3M to 25-pin 3M. Used with European 202C-type modems. Shielded.
92218A	50 ft. (15 m)	Longer 13242M cable.
13242-60005 (13242Y)	16.7 ft. (5 m)	Cable 25-pin 3M to 25-pin 3M. Three-wire cable with EMP protection for terminal from lightning-induced transients.
92218C	50 ft. (15 m)	Longer 13242Y cable.
92218D (13242X)	16.7 ft. (5 m)	Cable: 25-pin 3M to 3-pin 6M. Used as an RS-232-C interface cable for an HP 3000 Series 6X ATP.
13242-60010 (13242G)	16.7 ft. (5 m)	Cable: 25-pin 3M to 25-pin 3M. Used with RS-232-C compatible serial printers such as HP 2601/2631/2635. Shielded.
13242-60011 (13242H)	16.7 ft. (5 m)	Cable: 25-pin 3M to 25-pin 3F. Used with RS-232-C compatible serial printers. Shielded.
40242-60002 (40242Z)	16.7 ft. (5 m)	Cable: 25-pin 3F to 25-pin 3M. RFI-filtering modem bypass cable used for HP 2621B and HP 2629L terminals.
40242-60003 (40242C)	16.7 ft. (5 m)	Cable: 25-pin 3F to 25-pin 3M. RFI-filtering extender cable used with HP 2621B and HP 2629L terminals.
40242-60004 (40242M)	16.7 ft. (5 m)	Cable: 25-pin 3M to 25-pin 3M. RFI-filtering modem cable used with HP 2621B and HP 2629L terminals.

Part Number	Length	Description
02640-60043 (13232A)	15 ft. (4.5 m)	Cable: 30-pin 2F to 25-pin 3M. Used with U. S. modems Bell 103A, and 202C/D/S/T; signal-compatible acoustic couplers. Also used with HP 1000 and HP 3000 System multiplexers.
92219A	50 ft. (15 m)	Longer 13232A cable.
02640-60131 (13232N)	15 ft. (4.5 m)	Cable: 30-pin 2F to 25-pin 3M. Used with U. S. modems Bell 103A, 202C/D/S/T, and 212A, and with Vadic 3400; signal-compatible acoustic couplers. Also used with HP 1000 and HP 3000 System multiplexers.
92219B	50 ft. (1 5 m)	Longer 13232N cable.
5061-2409 (13232M)	15 ft. (4.5 m)	Cable: 30-pin 2F to 25-pin 3M. Used with European 202C-type modems.
92219C	50 ft. (1 5 m)	Longer 13232M cable.
02640-60059 (13232C)	5 ft. (1.5 m)	Cable: 30-pin 2F to 25-pin 3F. Used with standard asynchronous direct connect to non-HP computer.
92219D	50 ft. (1 5 m)	Longer 13232C cable.
02640-60128 (13232Y)	15 ft. (4.5 m)	Cable: 30-pin 2F to 25-pin 3M. Three-wire cable with EMP protection for terminal from lightning-induced transients.
92219E	50 ft. (1 5 m)	Longer 13232Y cable.
92219F (13232X)	16.7 ft. (5 m)	Cable: 30-pin 2F to 3-pin 6M. Used as an RS-232-C interface cable for an HP 3000 Series 6X ATP.

TABLE 2-26. HP 264X POINT-TO-POINT TERMINALS

Part Number	Length	Description
17355A	9 ft. (2. 3 m)	Cable: 25-pin 3M to 25-pin 3M. Pins 1-25 wired end-to-end.
31391A (30062C)	16.7 ft. (5 m)	Cable: 25-pin 3F to 25-pin 3M.
31391B	33.4 ft. (10 m)	Longer 30062C cable.
31391C (30062C, Opt. 001)	50 ft. (15 m)	Longer 30062C cable.
30062-60012 (30062C, Opt. 002)	100 ft. (30 m)	Cable: 25-pin 3F to 25-pin 3M. Pins 1-25 wired end-to-end, unshielded.
92219G	12.5 ft. (3.8 m)	Cable: 25-pin 3M to 25-pin 3M. Pins 1-8, 11, 12, 19, 20,22, 23, 25 wired end-to-end.
30062-60018 (30062D)	25 ft. (7.6 m)	Cable: 25-pin 3F to 25-pin 3M. Hardwire extension; pins 2, 3, 7 wired end-to-end.
92215A	50 ft. (15 m)	Longer 30062D cable.
30152-60001 (30152A)	16.7 ft. (5 m)	Cable: 25-pin 3F to 3-pin 6M; the 3F is a block RS-232-C connector. Used as an adapter cable between an HP 3000 Series 64 ATP and an existing RS-232-C terminal cable.
30153-60001 (30153A)	50 ft. (15 m)	Cable: 3-pin 6F to 3-pin 6M. Used as an extension cable for an HP 3000 Series 6X ATP RS-232-C interface.

TABLE 2-27. RS-232-C EXTENSION CABLES.

RS-422 Cables

5 Pin RS422 Hardwire or Extension Cable for ATP

The specification establishes requirement for a 5 conductor shielded cable - UL styles 2464 and 1061. The maximum length for an RS-422 cable is 4000 feet.

Electrical

Voltage Rating	300V for class 2 wiring system, rms @80oC (1000V rms between conductors and conductors to shield).
Conductor Resistance, DC	<30 ohms/1000 ft.
Mutual Pair Capacitance	<=22 pf between wires in pair.
Stray Capacitance	<=40 pf between one wire and all others (grounded)
Pair-to-Pair Balanced	>=40 dB of attenuation at 150KHz between any two pairs.
Crosstalk	
Mechanical	
Singles	Two twisted pairs plus one single AWG 24(7X32) tinned, stranded copper.
Insulation	PVC
Colors	One conductor of each twisted pair - white; the other conductors - blk,
	brn. Single conductor - red.
Cable Lay	Twist the twisted pairs around the single.
Shield (Inner)	Metallized polyester; metalization facing outward
Shield (Outer)	Braid from AWG 36 tinned copper for 85% minimum coverage.

Shield (Inner) Shield (Outer) Jacket Color

TABLE 2-28. HP 3000 SERIES 6X ATP, RS-422 CABLES

Pearl Gray cabinet per HP Visual Color Standard 6009-0108.

PVC, 35 mil minimum wall thickness.

Part Number	Length	Description
30154-60001 (30154A)	100 ft. (30 m)	Cable: 5-pin 7M to 5-pin 7F. Extender cable for connecting an HP 3000 Series 6X ATP and an RS-422 interface cable.
92216A (13222P)	16.7 ft. (5 m)	Cable: 50-pin 1M to 5-pin 7M. Used with HP 262X terminals. Five-wire cable for terminal to an HP 3000 Series 6X ATP, RS-422.
92216B (13232I)	16.7 ft. (5 m)	Cable: 30-pin 2F to 5-pin 7M. Used with HP 264X terminals. Five-wire cable for terminal to an HP 3000 Series 6X ATP, RS-422.
92216C	16.7 ft. (5 m)	Cable: 37-pin 5M to 5-pin 7M. Used with HP2688 printer. Five-wire cable for printer to an HP 3000 Series 6X ATP, RS-422.
13242P	16.7 ft. (5 m)	Cable: 5-pin 7M to 25-pin 3M. Used with 293x printers, 2686A printer, and 2392A terminal.

Cable Construction

Construction instructions for cable assemblies for the ATP are in the *Point-to-Point Workstation 1/O* Reference Manual, (Appendix D). Recommended tools, parts ordering information, pin diagrams, assembly procedures, and testing information are included. The following cable assemblies are covered:

- Three-pin male ATP to 25-pin female RS-232-C adapter cable,
- Three-pin male ATP to three-pin female RS-232-C extension cable,
- Five-pin male to five-pin female RS-422 extension cable.

For more information, refer to the Data Terminals Cabling Manual (P/N 02640-90185)

U. S. Modem Cable (30-pin 2F to 25-pin 3M)

COMPU	TER OR MODE (DCE)	ΞM				TERMINAL (DTE)
(BA) (BB) (CA) (CB) (CC) (AB) (CF)	SEND DATA RECEIVE DA REQUEST TO CLEAR TO S DATA SET R COMMON RET CARRIER DE	NTA SEND SEND SEADY TURN TECT	-2 -3 -4 5 -6 -7 -8	$\begin{array}{c} \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$	2 3 4 5 6 7 8	-SEND DATA (BA) -RECEIVE DATA (BB) -REQUEST TO SEND (CA) CLEAR TO SEND (CB) -DATA SET REACY (CC) -COMMON RETURN (AB) -CARRIER DETECT (CF)

2-48

DATA SET

Modem Connect (25-pin 3M to 25-pin 3M)

COMPUTER (DTE)

- 1. Required for 202S data sets only physically strapped together in the modem. The DTE (refer to Figure 2-2) can control SCA from either pin 11 or pin 19.
- 2. European modems only.
- 3. For 202C modems; Pin 11 is Supervisory Transmitted Data (SBA) at the DCE. Pin 12 is Supervisory Receive Data (SBB) at the DCE. Cross connect pins 11-12 and 12-11.

Special Cables

For unsupported terminals directly connected on an ATC that need RS232C signals -- configure as subtype 4, and construct cable as follows:

	COMPUTER (DTE)		EIA COMPATIBLE DEVICE (DCE)
(BA) (BB)	SEND DATA RECEIVE DATA	$2 \longleftarrow 2$ $3 \longrightarrow 3$ $4 \longrightarrow 4$ $5 \longrightarrow 5$ $6 \longrightarrow 6$	SEND DTA (BA) RECEIVE DATA (BB) REQUEST TO SEND (CA) CLEAR TO SEND (CB) DATA SET READY (CC)
(AB)	COMMON RETURN	$7 \leftarrow \rightarrow 7$ $8 \rightarrow 8$ $20 \rightarrow 20$	COMMON RETURN (AB) CARRIER DETECT (CF)
		MALE M	ALE

To cable terminals on an ADCC 202T modem -- configure as subtype 0 and construct using the following special cable:

COMPUTER (DTE)			E	IA COMPATIBLE DEVICE (DCE)
(PIN	PIN	
(BA)	SEND DATA	2 4 7	>2	SEND DATA (BA)
(BB)	RECEIVE DATA	3 ,		RECEIVE DATA (BB) REQUEST TO SEND (CA)
(AB)	COMMON RETURN	7	→7	COMMON RETURN (AB)
		9	→ 9	POSITIVE DC TEST
		20 MALE	MALE	DATA TERMINAL READY (CD)

SELECTED MPE INTRINSICS

TABLE 2-29. FCONTROL CONTROL CODES

Codes	Function
1	To cause a carriage control directive to be sent to the terminal or printer.
4	To set an FREAD timeout value.
10	To change device input speed.
11	To change device output speed.
12	To enable character echoing.
13	To disable character echoing.
14	To disable the System Break function.
15	To enable the System Break function.
16	To disable the Subsystem Break function.
17	To enable the Subsystem Break function.
18	To disable Tape Mode (Series II and III only).
19	To enable Tape Mode (Series II and III only).
20	To disable the timer that measures the duration of FREAD.
21	To enable the FREAD duration timer.
22	To read the results of an FCONTROL call made with a control code of 21.
23	To disable parity checking.
24	To enable parity checking.
25	To define line-termination characters for terminal input. Refer to Table 2-27.
26	To disable Binary Editing Mode.
27	To enable Binary Editing Mode.
28	To disable Block Mode processing by the user program.
29	To enable Block Mode processing by the user program.

TABLE 2-29. FCONTROL CONTROL CODES (cont'd)

Codes	Function
34	To print !!! at the terminal when an input line is deleted.
35	To block printing of !!! at the terminal when an input line is deleted.
36	On Series II/III, to enable parity generation, but not parity checking, by the port.
	On Series $3X/4X/6X$, to determine the current parity. Refer to Table 2-28.
37	To allocate a non-: JOB and non-: DATA-accepting terminal.
38	To set the Terminal Type. You must call FDEVICECONTROL for a user-defined terminal type.
39	To determine the current Terminal Type. On Series $3X/4X/6X$, MPE V or later, a value of 0 is returned for user-defined terminal types.
40	To determine the current device output speed.
41	To enable Transparent Editing Mode.
43	To abort a pending NO-WAIT I/O request.

A large majority of FCONTROL codes affect all files open on a device. Consequently, when you close the file named in one of these calls, the action of the FCONTROL call will still be in effect for the other files. Only five apply to the file whose file number was used in the call. Table 2-26 shows the scope of each of the FCONTROL control codes:

TABLE 2-30. AFFECTS OF CONTROL CODES

FCONTROL Codes Affecting all Files on the Device	FCONTROL Codes Affecting only the File Specified in the FCONTROL Call
4, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 34, 35, 36, 37, 38, 39, 40, 41, 43	25, 26, 27, 28, 29

When the device is closed, all parameters are reset to defaults. (Refer to "Actions on FCLOSE" for device close actions.)

The following characters may not be defined as alternate End-of-Record characters for devices attached to any of the port controllers:

ASCII Character	Terminal Keys	Octal Code
NUL (Null)	(CONTROL)@	%0
BS (Backspace)	(CONTROL) H	%10
LF (Line Feed)	(CONTROL) J	%12
CR (Carriage Return)	(CONTROL) M	%15
DC1 (XON)	(CONTROL)Q	%21
DC2	(CONTROL) R	%22
DC3 (XOFF)	(CONTROL) S	%23
CAN (Cancel)	(CONTROL) X	%30
EM (End of Medium)	(CONTROL) Y	%31
ES (Escape)	(CONTROL) [%33
DEL (Rubout)		%177

TABLE 2-31. UNRECOGNIZED ALTERNATE EOR CHARACTERS

In addition, when you are working at the console, (CONTROL) A cannot be defined as an EOR character.

Code	ATP ADCC (MPE V/E)	ADCC (MPE IV or MPE V/P)	ATC
0	Input:	Input:	Input:
	Even parity checked, if enabled.	Even parity checked, if enabled.	No checking bit 8 set to 0.
	Output:	Output:	Output:
	Bit 8 set to 0, if enabled.	Even parity generated, if enabled.	All 8 bits transmitted.
1	Input:	Input:	Input:
	Odd parity checked, if enabled.	Odd parity checked, if enabled.	No checking bit 8 set to 0.
	Output:	Output:	Output:
	Bit 8 set to 1, if enabled.	Odd parity generated, if enabled.	Bit 8 set to 1.
2	Input:	Input:	Input:
	Even parity checked, if enabled.	Even parity checked, if enabled.	Even parity checked, if enabled.
	Output:	Output:	Output:
	Even parity generated, if enabled.	Even parity generated, if enabled.	Even parity generated if bit 8 of the character to be output is 0.
			Odd parity generated if bit 8 of the character to be output is 1.
3	Input:	Input:	Input:
	Odd parity checked, if enabled.	Odd parity checked, if enabled.	Odd parity checked, if enabled.
	Output:	Output:	Output:
	Odd parity generated, if enabled.	Odd parity generated, if enabled.	Odd parity generated, if enabled.

TABLE 2-32. RESULTS OF parity parm -- FCONTROL(36).

2-54

FCHECK Status and Error Codes

The following File System error codes could result from an error during a terminal or printer related intrinsic call; Table 2-33 shows the status codes returned by the driver in the Terminal "IOQ" and the corresponding File System code (in decimal) that is returned in the *errorcode* parameter.

Status	FS Code	Meaning
0		Operation not completed or not started.
1		Operation completed normally.
2	0	End of file reached.
4	20	Invalid operation requested by program (e.g. "set Terminal Type to -24").
13	21	Parity error occurred during read.
23	22	Read Limit Timer set by user expired. (Timer set via FCONTROL(4).)
53	24	Terminal or printer not ready (not on line, modem Data Set Ready signal not "high," line disconnected.)
24	27	Block Mode Read Timer (set by terminal driver) expired. Timer expires if the driver never receives the RS character. A data overrun at the port controller or a problem with the terminal's function keys could prevent the driver from receiving the EOR character.
34	28	Timing error-device was not serviced in time, or a data overrun occurred.
11	31	Read of line ended on an alternate end-of-record character. (A character defined via FCONTROL(25).)
33	32	Input/output operation aborted by the ABORTIO command (or some other program-external action).
43	33	Data lost, no buffer was available, or a tapemode (PTAPE) record of too great a length was sent.
173	95	The read was halted because the terminal operator hit (BREAK). The File System will automatically re-start the read when the operator enters the :RESUME command.
153	97	The terminal operator typed (CONTROL)Y (requesting a Subsystem Break), but no (CONTROL)Y PIN exists.
163	98	User attempted to set an expiration value for the Read Limit Timer greater than the maximum allowable value of 32767 seconds.

TABLE 2-33. FCHECK STATUS AND ERROR CODES

Functions of FDEVICECONTROL

There are a number of items available through FDEVICECONTROL, which are specified in Table 2-34. The table shows you the item number, along with the type of access and the type of variable for that item.

Byte and byte arrays are accessed through integers and integer arrays to make all accesses through word addresses. Single bytes are stored in the right half of the integer; byte arrays are stored packed beginning in the left half of the first word of the integer array. Items listed as a logical word are set based on bit 15 of the words passed. The returned values are -1 if the value is true and 0 if the value is not true.

TABLE 2-34.	FDEVICECONTROL	ITEM NUMBER.

Item #	Access	Туре	Function
1	R/W	IA	Terminal type file name
11	R/W	L	Parity checking and generation enabled
12	R/W	I	Type of parity (refer to Table 2-28.)
15	R/W	I	Unedited mode characters: the returned value has the
			following format:
			bits (0:8) = subsystem break character
			bits (8:8) = special EOR character
171	R/W	I	Enquiry character

56	R/W	I	Data bits per character (only 7 or 8 bits supported)
57	R	I I	Last subsystem break character accepted.

TABLE 2-34. FDEVICECONTROL ITEM NUMBER (cont.)

⁴ Programmatic control of these parameters may not be available on future versions of the HP 3000 system. Control via user defined terminal types will be available.

² Future terminal I/O controllers will not support this feature.

Actions on FCLOSE

On any FCLOSE, the following actions are taken:

- · Clear tape mode
- Re-enable CONTROL X Echo
- Disable read timeout
- Reset parity to logon

- Clear transparent mode
- Disable read duration timer
- Clear Subsystem break
- Return TBUF's

When the last file opened against the terminal is closed, a "device close" is issued by the file system. The actions taken on a device close (or modem disconnect) are:

- · Clear all parity
- Clear ENQ/ACK wait
- Clear XON wait
- Perform FCLOSE
- Return EOF-saved TBUF's flush I/O
- · Clear tape mode
- Turn Echo on
- Disable System Break
- Disable Break
- Clear logon termtype

- Hang up modem, if connected to modem
- Disable ENQ/ACK protocol
- Clear DC2 received
- Clear Break mode and Console mode
- Clear printer information
- · Clear logon parity
- Set to default termtype
- Initialize half-duplex mode and full-duplex mode
- Start idle read waiting for speed-sense

ATP ERROR MESSAGES

The messages listed in Table 2-35 occur during ATP initialization (ATPINIT). ATP must be in control (up and running) to receive these messages.

Some of these messages are followed by a system failure, which results in a system failure message (shown in Table 2-37), followed by a halt. When a halt occurs, a software dump should be initiated.

Message	Recovery
ATP MESSAGE (1) The data segment size needed for DRT <i>nn</i> is <i>mn</i> words too large. The number of terminal buffers and/or the number of units must be reduced for the DRT.	Sysdump the system and reduce the number of terminal buffers first.
ATP MESSAGE (2) No disc space available for the data segment for the DRT <i>nn</i> . Hence, all units for this DRT will be inoperative.	Attempt a RECOVER LOST DISC SPACE operation. If this fails, something is probably wrong with the disc. Contact your HP Representative.
ATP MESSAGE (3) No memory available for the data segment for the DRT <i>nn</i> . Hence, all units for this DRT will be inoperative.	Verify that the AVAILABLE MEMORY specifies at least 512 kb. If not, there is a serious system fault. Contact your HP Representative.
ATP MESSAGE (4) Can't lock the data segment for the DRT <i>nn</i> in memory. Hence, all units for this DRT will be inoperative.	Attempt a COLDSTART. If the problem persists, call your local HP Representative.
ATP MESSAGE (5) Due to an error reported earlier, the console can not be set to the proper state. Hence, it is not possible to continue.	Attempt a COLDSTART. If the problem persists, call your local HP office. Note, this is followed by S.F. #703. See Table 2-37 for the recovery to be taken.
ATP MESSAGE (6) Cannot load the ATP software. Hence, it is not possible to continue.	The ATP driver may be missing. Perform an UPDATE with the latest Installation Tape (IT).
ATP MESSAGE (7) Channel for DRT <i>nn</i> is not responding. Hence, all units for this DRT will be inoperative.	The Synchronous Interface Board (SIB) is not responding. Contact your HP Representative.
ATP MESSAGE (8) Inconsistent internal tables. Hence, it is not possible to continue.	Attempt a reload as it suspected that MPE was not loaded properly. If the problem continues, contact your HP Representative for assistance.
ATP MESSAGE (9) Unexpected hardware error on channel for DRT <i>nn</i> . This situation could cause problems in the future.	Possible ATP problem. Contact your HP Representative. However, the ATP subsystem is still considered operational.

TABLE 2-35. ATP MESSAGES

Message	Recovery
ATP MESSAGE (10) Asynchronous Interface Board (AIB) nn for DRT m does not respond. Hence, units pp thru qq will be inoperative.	The AIB indicated a hardware problem. Contact your HP Representative. NOTE: The units should be marked BROKEN and UNFIXABLE when you execute the BROKEN command in ATPDSM. If they are just marked BROKEN, then attempt a reset of the ports using the RESET command.
ATP MESSAGE (11) Unable to set the console to the proper state. Hence, it is not possible to continue.	The system is attempting to come up for the first time or it is attempting to recover from a Power Failure. Verify that the console is operational. If it is, then your should attempt a COOLSTART. If the problem persists, contact your HP Representative.
ATP MESSAGE (12) No data segment is available for DRT nn . Hence, all units for the this DRT will be inoperative.	There is a possible problem when loading MPE, therefore, a COLDLOAD, or RELOAD must be performed. If the problem persists, contact your HP Representative.
ATP MESSAGE (14) Unable to access the system configuration file. Hence, the default number of terminal buffers per port (nn) will be used for the data segment for the DRT mm	This situation could cause problems elsewhere in the system operations. If you receive this message when the next system is loaded, you should have it investigated by your account System Engineer.
ATP MESSAGE (15) Invalid speed (in characters per second) specified for unit <i>nn</i> (DRT <i>nm</i>). Hence, the default speed (<i>pp</i>) will be used.	Verify I/O configuration for the proper speed specification. If it is not correct, start the system with a COOLSTART and correct the speed.
ATP MESSAGE (16) Unable to set unit <i>nn</i> (DRT <i>mn</i>) to the proper state. Hence, this unit will be inoperative.	Possible ATP hardware problem. Contact your HP Representative.
ATP MESSAGE (17) Unit <i>nn</i> for the DRT <i>mn</i> exceeds the highest allowable unit number <i>pp</i> . Hence, this unit will be inoperative.	The highest allowable UNIT $#$ is 95. Verify the I/O configuration.
ATP MESSAGE (18) Subtype nn aspecified for the unit mm (DRT pp) is invalid. Hence, the default term type (qq) will be used.	The valid substypes for the ATP subsystem are 0, 1, 9, 14, and 15. Verify that the I/O configuration is correct for this unit.
ATP MESSAGE (19) Term types nn specified for unit nm (DRT p invalid. Hence, the default term type (qq) will be used.	The valid terminal types for ATP are 6, 9, 10, 12, 13, 15, 16, 18, 19, 20, 21, and 22. Verify that the I/O configuration is correct for this unit.

TABLE 2-35. ATP MESSAGES (Cont'd)

Message	Recovery
ATP MESSAGE (20) Logical device <i>nn</i> specifies a previously defined physical unit. Hence, this logical device will be inoperative.	This situation could cause problems in the future. Verify the I/O configuration for errors.
ATP MESSAGE (21) Unable to perform I/O to the console. Hence, it is not possible to continue.	Verify that the console is operational. If so, then there is a problem with MPE. Perform a COLDSTART to clear the problem. If the console is bad, contact your HP Representative.
ATP MESSAGE (22) Device type for logical device <i>nn</i> and its assigned driver do not match (<i>mm</i> versus <i>pp</i>). Hence, it is not possible to continue.	There is a problem outside of the ATP that could involve memory hardware. This message will be followed by a S.F #710. Perform a software dump then attempt a COLDSTART. If the problem persists, contact your HP Representative.
ATP MESSAGE (23) Logical device <i>nn</i> specifies device type <i>mn</i> , however, the driver configured does not support devices of this type. Hence, this unit will be inoperative.	ATP subsystem has 2 driver names. HIOTERM1 for device type 16. HIOASLP0 for device type 32. Verify the I/O configuration for this LDEV.
ATP MESSAGE (24) The number of terminal buffers for DRT nn have been increased to the minimum number nm allowed for the pp unit.	The algorithm in the ATP initiation procedure requires a minimum number of TBUF's to be allocated. To correct this, increase the number of terminal buffers per port via SYSDUMP.
ATP MESSAGE (25) The junction panel for Asynchronous Interface Board (AIB) <i>nn</i> for DRT <i>nm</i> does not respond. Hence, every mode unit on this AIB will be inoperative.	It is possible to have these units operational by changing the subtype from 1 to 0 (direct connect). Otherwise, there is a hardware problem on the modem mother board that must be repaired in order to have these units operational as modem ports. Call your HP Representative.
ATP MESSAGE (25) The junction panel for Asynchronous Interface Board (AIB) <i>nn</i> for DRT <i>mn</i> does not respond. Hence, every direct connect unit on this AIB may not respond.	Units are probably still functional because only the MSC chip is suspected as being bad. MSC is required for modem connections. However, the board should be checked out. Contact your HP Representative.
ATP MESSAGE (26) The junction panel for Asynchronous Interface Board (AIB) <i>nn</i> for DRT <i>mn</i> does not support modem units. Hence, every modem unit on this AIB will be inoperative.	It is possible that an AIB was configured with the wrong subtype for a direct connect mother board. Verify that all modem units are configured for the correct AIB/mother board combination.

TABLE 2-35. ATP MESSAGES (Cont'd)

Message	Recovery
ATP MESSAGE (27) Self test failed on the Modem Controller Chip (MCC) for unit <i>nn</i> for DRT <i>mn</i> Consequently, the state of the juncti panel is not known. Hence, this direct connect unit may not respond.	Modem control is not required for direct connect units. Therefore, the system only considers this a warning. However, if this message repeats for units on the same Asynchronous Interface Board (AIB), there is probably a bad MCC chip on this AIB and the board should be repaired. Contact your HP Representative.
ATP MESSAGE (27) Self test failed on the Modem Controller Chip (MCC) on Asynchronous Interface Board (AIB) <i>nn</i> for DRT <i>mm</i> Hence, every modem unit on this AIB will be inoperative.	Possible hardware problem on this AIB. To get the units operable, reconfigure these units as subtype 0 then call the local HP office for assistance in repairing AIB.
ATP MESSAGE (27) Self test failed on the Modem Controller Chip (MCC) for unit nn for DRT mm . Hence, this modem unit will be inoperative.	Run ATPDSM diagnostics against the entire AIB board to see if all units fail. If so, the AIB board is bad for modem ports. It could still be reconfigured for direct connect. Contact your HP Representative.
ATP MESSAGE (28) Self test failed on the Modem Scanner Chip (MSC) for unit nn for DRT mn Hence, this modem unit will be inoperative.	ATP hardware problems on the Modem Mother board. Contact your HP Representative.
ATP MESSAGE (28) Self test failed on the Modem Scanner Chip (MSC) on the junction panel for Asynchronous Interface Board (AIB) <i>nn</i> for DRT <i>mn</i> Hence, every modem unit on this AIB will be inoperative.	ATP hardware problems on the Modem Mother board. Contact your HP Representative.
ATP MESSAGE (29) The Port Controller Chips (PCCs) for each modem unit on Asynchronous Interface Board (AIB) <i>nn</i> for DRT <i>mm</i> are incompatible with the Modem Controller Chip (MCC) on this AIB. Hence, every modem unit on this AIB will be inoperative.	There are 2 possible revision levels for 6801 chips on AIB's. They can not be mixed on the same board. The AIB is inoperative. Contact your HP Representative.
ATP MESSAGE (30) Self test failed to complete on the Port Controller Chip (PCC) for unit <i>nn</i> for DRT <i>mn</i> . Hence, this unit will be inoperative.	There is probably a bad PCC chip for this unit. Contact your HP Representative for help in repairing the AIB board.
ATP MESSAGE (30) Self test failed to complete on the Port Controller Chip (PCC), Modem Controller Chip (MCC), and junction panel for unit <i>nn</i> for DRT <i>mn</i> . Hence, this modem unit will be inoperative.	There may be a problem outside of the ATP subsystem. However, to further verify this unit, reconfigure it as a direct connect port and repeat the test. If the problem persists, contact your HP Representative.

TABLE 2-35. ATP MESSAGES (Cont'd)

Message	Recovery
ATP MESSAGE (30) Self test failed to complete on the Port Controller Chip (PCC), Modem Controller Chip (MCC), and the junction panel for unit <i>nn</i> for DRT <i>mn</i> . Hence, this direct connect unit may n respond.	Verify that the other units on the AIB, which this unit is on, are operational. If so, there is probably a bad PCC for this unit. Contact your HP Representative.
ATP MESSAGE (31) Self test failed on the Port Controller Chip (PCC) for unit <i>nn</i> for DRT <i>mm</i> Hence, this unit will be inoperative.	This port is permanently disabled. However, the remainder of the ports should be operational. The AIB board must be repaired with a good PCC chip. Contact your HP Representative.
ATP MESSAGE (32) The junction panel for unit <i>nn</i> for DRT <i>mn</i> does not support modem units. Hence, this modem unit will be inoperative.	The AIB unit specified is probably physically hooked up to a direct connect mother board. Either reconfigure for a direct connect, or connect the AIB to a modem port.
ATP MESSAGE (33) The Port Controller Chip (PCC) and Modem Controller Chip (MCC) for unit <i>nn</i> for DRT <i>mm</i> are not compatible. Hence, this modem unit will be inoperative.	The AIB has different revisions of the 6801 chip on it. These chips must all be the same. Have the board repaired.
ATP MESSAGE (34) The console will not be set inoperative. This situation could cause problems in the future.	Ambiguous test results occured during the ATP subsystem initialization. Call the local HP office for assistance; the ATP hardware should be verified.
(Unnumbered Messages) In order to continue, the total number of terminal buffers for this DRT (terminal buffers per unit time configured for the DRT) has been reduced from <i>nn</i> to <i>mn</i> terminal buffers. For your future information, each configured unit requires <i>pp</i> words, each terminal buffer requires <i>qq</i> words, and at least <i>rr</i> terminal buffers are required for the ss units configured.	The size of the extra data segment, required by the ATP subsystem, was too small to contain all the terminal buffers asked for. Therefore, the initialization procedure has reduced the number until all the buffers fit in the configured maximum extra data segment size. To avoid this message, either reduce the number of terminal buffers required, the number of units configured, or increase the maximum data segment size.

TABLE 2-35. ATP MESSAGES (Cont'd)

2-62

ADCC (MPE V/E) ERROR MESSAGES

The messages listed in Table 2-36 occur during ADCC initialization (ADCCINIT). ADCC must be in control (up and running) to receive these messages.

Some of these messages are followed by a system failure, which results in a system failure message (shown in Table 2-37), followed by a halt. When a halt occurs, a software dump should be initiated.

Message	Recovery
ADCC MESSAGE (1) A data segment is not available for the ADCC terminal data segment. Hence, all ADCC devices will be inoperative.	There is a possible problem when loading MPE, therefore, a COLDLOAD, or RELOAD must be performed. If the problem persists, contact your HP Representative.
ADCC MESSAGE (2) No disc space is available for the ADCC terminal data segment. Hence, all ADCC devices will be inoperative.	Attempt a RECOVER LOST DISC SPACE operation. If this fails, something is probably wrong with the disc. Contact your HP Representative.
ADCC MESSAGE (3) Memory is not available for the ADCC terminal data segment. Hence, all ADCC devices will be inoperative.	Verify that the AVAILABLE MEMORY specifies at least 512 kb. If not, there is a serious system fault. Contact your HP Representative.
ADCC MESSAGE (4) Can't lock the ADCC terminal data segment. Hence, all ADCC devices will be inoperative.	Attempt a COLDSTART. If the problem persists, call your local HP office. Note, this is followed by S.F. #703.
ADCC MESSAGE (5) Due to an error reported earlier the console cannot be set to the proper state. Hence, it is not possible to continue.	The system is attempting to come up for the first time or it is attempting to recover from a Power Failure. Verify that the console is operational. If it is, then you should attempt a COOLSTART. If the problem persists, contact your HP Representative.
ADCC MESSAGE (6) The minimum ADCC terminal data needed is larger than the maximum allowable data segment. Hence, all ADCC devices will be inoperative.	Increase maximum data segment size.

TABLE 2-36. ADCC MESSAGES

TABLE 2-36. ADCC MESSAGES (cont'd)

Message	Recovery
ADCC MESSAGE (7) The ADCC terminal data segment needed is larger than the maximum allowable data segment. The total number of tbufs has been reduced from n to m . The ADCC devices may not operate correctly.	Sysdump the system and reduce the number of terminal buffers first.
ADCC MESSAGE (8) The number of ADCC terminal buffers has been increased to the minimum n per ADCC device.	The algorithm in the ATP initiation procedure requires a minimum number of TBUFs to be allocated. To correct this, increase the number of terminal buffers per port via SYSDUMP.
ADCC MESSAGE (9) Invalid speed for ldev n . Hence, then default speed m will be used.	Verify I/O configuration for the proper specification. If it is not correct, start the system with a COOLSTART and correct the speed.
ADCC MESSAGE (10) Invalid subtype for ldev n . Hence, the default subtype m will be used.	The valid subtypes for the ATP subsystem are 0,1,9,14 and 15. Verify the I/O configuration is correct for this unit.
ADCC MESSAGE (11) More than 64 ADCC devices are configured. Hence, all those devices will be inoperative.	Don't configure more than the maximum supported devices.
ADCC MESSAGE (12) It was not possible to set the console to the proper state. Hence, it is not possible to continue.	The system is attempting to come up for the first time or it is attempting to recover from a Power Failure. Verify that the console is operational. If it is, then you should attempt a COOLSTART. If the problem persists, contact your HP Representative.

2-64

Message	Recovery
ADCC MESSAGE (13) It was not possible to set ldev n to the correct state. Hence, this ldev will be inoperative.	This should never occur. Take a sysdump and contact your HP Representative.
ADCC MESSAGE (14) Incorrect driver	Verify I/O configuration.
configured for Idev <i>n</i> . Hence, it is not possible to continue.	
ADCC MESSAGE (15) File n for DRT m is invalid. Hence, then default termtype p will be used.	Check user defined Termtype file or perform update.
ADCC MESSAGE (16) Termtype n specified for DRT m is invalid. Hence, the default code segment data will be used.	Check user defined Termtype file or perform update.
ADCC MESSAGE (17) The code segment data base has been corrupted.	Check user defined Termtype file or perform update.

TABLE 2-36. ADCC MESSAGES (cont'd)

System Failure	Cause	Recovery
#700	Initialize or power fail can not recover, because DB is not SYSDB.	Perform a memory dump of the system and send the dump and a service request to the Information Network Division (IND).
#701	The terminal subsystem cannot run on this system. (MIT) is loaded on an HP 300 Series II/III system.	
#703	The console I/O tables cannot be initialized.	Verify that the console has been configured correctly, otherwise perform a memory dump and submit the dump with a Service Request to IND.
#704	The console cannot be allocated (that is, the console initialized but the I/O function to the console has failed).	Dump the system and send the dump in with a Service Request to IND.
#705	An attempt was made to build the terminal data segment, and it failed.	Reboot the system. If the situation continues, dump the system, then call your HP Representative for assistance.
#706	The terminal software could not be loaded, frozen and locked in memory.	Verify that all the required terminal segments are present. If not, perform an UPDATE. If all the segments are present, perform a memory dump and attempt a reload. Submit the dump with a Service Request to IND.

TABLE 2-37. TERMINAL SYSTEM FAILURES.

System Failure	System Cause I Failure I	
#708	LDT could not be locked and frozen in memory.	Reduce the # of terminal ports configured and/or reduce the system resources (i.e., # of CST's,DST's,TBUF) or perform a memory dump and submit the dump with a Service Request to Computer Systems Division (CSY).
#709	Invalid entry in LPDT.	Perform a memory dump and submit the dump with a Service Request to Computer Systems Division (CSY).
#710	Information in the I/O Tables for a particular LDEV is inconsistent.	Verify that the device type is appropriate for the driver configured. If it's ok, perform dump of the system, then attempt a RELOAD. If it still fails, start hardware troubleshooting outside of the terminal subsystem (that is, memory or CPU).
#711	There's a bad TBUF link pointer in the returned TBUFs.	Perform a memory dump of the system and submit it with a Service Request to IND.
#712	There's a bad TBUF head pointer to free list.	Perform a memory dump and submit the dump with a Service Request to IND.
#713	ATTACHIO returned an error on an I/O request for the console during system initialization.	Perform a memory dump of the system, then submit the dump with a Service Request after attempting to RELOAD the system.

TABLE 2-37. TERMINAL SYSTEM FAILURES (cont'd)

System Failure	Cause	Recovery
#714	A terminal hardware error was detected by the terminal subsystem.	Begin troubleshooting via off-line diagnostics.
#715	An terminal failure occured on the console.	Perform a memory dump and submit a Service Request after verifying that the console is alright.
#716	An I/O Instruction failure occured.	Troubleshoot the hardware outside of the terminal subsystem first.
#717	The disc copy of IMANAGER was corrupt; therefore the terminal type information could not be accessed.	Perform a Memory Dump, then Update or Cold Load from tape.
#719	Corrupt data stack.	Perform a Memory Dump.
#720	Invalid MPE tables.	This should never happen. Perform a Memory Dump.
#721	The wrong driver specified for the wrong controller.	Check the the driver name to match the controller. Perform a memory dump.

30360A Hardwired Serial Interface (HSI)

The HP 30360A is a controller interface which uses modified binary synchronous protocol for high speed asynchronous data communications between HP 3000 CPUs and/or the HP 1000 systems used with the DS/3000 subsystems. (RJE/3000 will also run using this controller between two HP 3000 Systems.) The connection between machines is via a pair of coaxial cables.

Basic Configuration

Hardwired Serial Interface Kit includes one PC board (30360-60001), cable connector panel (30360-60003), and one coaxial cable as follows:

Cable	Options
30220A25 ft.	001

30055A Synchronous Single Line Controller (SSLC)

The HP 30055A SSLC is a controller interface for high speed bit-serial synchronous devices. The controller can accommodate one modem device and is utilized with the RJE, DS, MRJE, and MTS subsystems. With MTS (Multipoint Terminal Software), the SSLC board may optionally be used for asynchronous transmissions. An SSLC may not be used for IMF, NRJE, Remote Data Link (MTS), HP 2608S printer, or HP 2333A Cluster Controller.

Basic Configuration

Synchronous Single Line Controller kit includes one PC board (30055-60001), cable assembly (30055-60008⁴), and test connector (30055-60009). On previously installed systems, obsolete interface cable 30055-60003 and obsolete test connector 30055-60005 may be present. Within the United States this combination will work for synchronous testing. Outside the USA, only the 30055-60008⁴ cable and 30055-60009 test connector combination is recommended for synchronous mode. The test connectors are designed for use with a particular cable and thus are not interchangeable. For asynchronous communication under MTS, use cable assembly 30055-60010. (Refer to "SSLC Cabling" for Wiring Diagrams).

^a 30055-60011 replaces 30055-60008. Pin 23 (Modem speed) tied high on 60011 cable. (Always "ON")

30010A, 30020A/B Intelligent Network Processor (INP)

The Intelligent Network Processor (INP) is a communications interface which provides the HP 3000 with data communications capabilities in a high speed as well as a low speed environment. The HP 30010A is used with a Series II/III. The HP 30020A/B is used with Series 3X/4X/6X. An INP can accommodate one modem, or a test hood, or an INP-to-SSLC direct-connect cable, or an INP-to-INP direct-connect cable. An INP may be used with the RJE, DS, MRJE, MRJE, MTS, and IMF subsystems. With MTS an INP may optionally be used for asynchronous transmission.

Basic Configuration:

The standard HP 30010A INP consists of:

- One INP Microprocessor PCA board (30010-60001)
- One INP Data communications interface PCA board (30010-60002)
- One Flat Cable (ribbon cable for connecting the two INP PCA boards) (30000-93052)
- One Memory Power Jumper PCA board (30380-60033)
- One I/O Memory Power Cable (30380-60034)
- One I/O Memory Jumper Cable (30380-60035)

The standard HP 30020A INP consists of:

- One Intelligent Network Processor PCA board (30020-60001)
- One HP-IB ribbon cable (30090-60051).

The standard HP 30020B INP consists of:

- One Intelligent Network Processor PCA board (30020-60009).
- One HP-IB ribbon cable (30090-60051).

INP DIAGNOSTIC/SUPPORT MONITOR (DSM)

The Diagnostic/Support Monitor (DSM) is a software tool that can be used both for verification testing and for more detailed troubleshooting. Different levels or modes of interactive operation are provided to make DSM a useful aid to the computer user, as well as an installation and/or troubleshooting tool for the HP Customer Engineer (CE) or Systems Engineer (SE).

DSM includes a series of tests that exercise both the INP hardware and associated software. The DSM tests (listed in table 3-1) begin by testing the most basic functions of the INP and progressively become more inclusive and more detailed.

Group No.	Test No.	Test Name
1	1.1 1.2 1.3	Mainframe Interconnect Driver Communication Native INP Communication Simple Interconnect
2	2. 1 2. 2	INP Self Test INP Microprocessor

7	7.1 7.2	BISYNC INP-to-INP SDLC INP-to-INP

TABLE 3-1. DSM TESTS

Operational Overview

The INP Online Diagnostic/Support Monitor (DSM) is designed to run as either a job or a session. A customer user can invoke a DSM job from an MPE session and then review the standard test sequence results at the completion of the job. The support user may elect to run DSM as a job or as a session. Unlike the customer user, the support user has the ability to direct DSM execution by a series of commands. These commands may be entered either from the standard job/session input file or from a selected "DSM command" file. (Refer to the INP Modules of the Datacomm CE Handbook for further information). Either type of DSM user must have the MPE diagnostician capability (DS) in order to run DSM.

User inputs are accepted in either upper or lower case characters. Certain MPE commands can be executed during a DSM session by manually inserting the colon (:) prompt. Note that the Diagnostic/Support Monitor is dependent upon the MPE operating system. Therefore, if MPE is not functioning on the system with the INP to be tested, DSM is not operational.

Customer User Operation

Once you have created an MPE session, you can invoke the DSM job by entering:

RUN DSM. PUB. SYS RETURN

When DSM has verified that you have MPE diagnostician capability, it inspects the system tables to determine the logical device number of each INP in the system. If there is more than one INP, DSM displays each logical device number and asks you to indicate the INP to be tested. When the INP to be tested has been determined, DSM prompts for JOB CARD parameters (such as: job name, user/account names and passwords, etc.). DSM verifies that the Support Files are present on the system and that they are of the same version number as the DSM program. Any deviation is reported to the user, and DSM is aborted. With this input, the DSM session streams an MPE job that does the actual testing of the INP. You will then see:

#Jxxx INP DSM EXECUTION TIME IS APPROXIMATELY 77 MINUTES

END OF PROGRAM

where xxx is the job number assigned by MPE and zz is the number of minutes needed for complete execution of the DSM standard test sequence.

The streamed DSM job runs with the HIPRI job parameter to allow immediate execution. The \$STDLIST file should be checked to confirm that it is ready for the test summary. For example, check to see that no special forms are mounted. The DSM job lists all test results on the standard output file. Basically, the results include the test name and its pass or fail results.

SSLC AND INP CONFIGURATION DIALOGUE SUMMARY

If several subsystems will use the SSLC or INP, it must be configured so as to be compatible for all. This table summarizes the configuration choices available for each subsystem when it is the *sole* user of the SSLC or INP. The user will need to select the choices that will permit his or her particular set of subsystems to use the SSLC or INP.

BELL MODEMS

The following Synchronous modem recommendations and options are for use with the 30055A Synchronous Single Line Controller (SSLC) or 30010A/30020A/B Intelligent Network Processor. Further definition of these options and capabilities can be obtained from the relevant *Bell System Technical Reference* publication, which is available from your local Bell System Representative or CCITT reference.

Modem Configurations

Modems can be connected in one of two basic configurations:

Configuration A

Point-to-Point Connection (RJE, MRJE, DS, IMF*, MTS)

Public (Switched) or Private (Leased) Line (* IMF must be leased.)

Configuration B

Multi-Point Connection (MTS, IMF - as tributary)

Control Tributary MODEM HP Modems BELL Modems MODEM 37210T 201C 37230A 208A 2024A 2048A,C DDS

Private (leased) Multi-Point Line

Note 1: Switch controlled 50 or 150 msec Request-to-Send Clear-to-Send delay.

801 AUTO CALL UNIT OPTIONS

Description	Recommendation
Abandon Call Timer Control	Stop
Abandon Call Timer Options	56 seconds
Call Termination Control	Via Data Set
Signal Ground Option	Signal to Frame

BELL 209A Modem

Private Leased Line, Full Duplex, Point-to-Point

Type of Modem	Bell System Type 209A Data Set (Also called DATAPHONE 9600)
Type of Line	Private Leased Line (3002 Type 4-wire) with D1 conditioning
	(No C conditioning.)
Transmission Rate	9600 bits-per-second
HP Products	RJE, MRJE, NRJE, DS, IMF, MTS - Configuration A

Note that this modem will accept four simultaneous devices as long as their aggregate speed does not exceed 9600 bps.

Option Number	Description	Comments
A1	Transmitter timing supplied by data set.	
B3	Data Set Ready interface lead ON for Analog Loopback mode.	
C6	Transmitter timing not slaved by receiver.	
D8	Elastic Store option disabled (OUT).	
E9	Continuous carrier operation.	
	Grounding: Protective ground to signal ground.	AA to AB
	With alternate voice. Without alternate voice.	Either ¹

TABLE 3-14. BELL 209A MODEM OPTIONS

¹ The data set is normally supplied without a hand set.

BELL DATAPHONE II 2024A Modem

Private Leased Line, Point-to-Point, Full Duplex

Type of Modem	Bell System Type DPII 2024A Data Set
Type of Line	Private Leased Line or Public Telephone Network (Dial Back-Up).
Transmission Rate	2400 bits-per-second
HP Products	RJE, MRJE, NRJE, DS, IMF, MTS - Configuration A

For Dataphone II modems:

- Only one control on each line.
- C is usually the control computer site.
- T is usually the remote computer, host, or terminal site.
- C and T are for diagnostic purposes only.

HP MODEMS

Hewlett-Packard 37210T Modem

Type of ModemSynchronousType of LinePrivate Line, Switched Telephone Network.Transmission Rate4800 bits per second, 2400 bps fallback.

Options

Option 001: PTT Module (Private Line Isolation) ^a Option 002: Two-wire Switched Line Isolation Option 003: Auto Answer USA Option 004: Secondary Channel Option 005: Remote Command ^a

¹ Not required in the USA.

² Four-wire Leased Lines only. Options 002 and 003 must be installed in modem.

Modem Configuration Recommendations

See "Modem Strapping Configuration Log" located inside the modem top cover. More comprehensive strapping information is to be found in the Operating and Service Manual, (37210-90000).

Hewlett-Packard 37220T Modem

Type of ModemSynchronousType of LinePrivate Line, D1 conditioning recommended.Transmission Rate9600 bits per second, 4800 bps fallback.

Options

Option 001: PTT Module (Private Line Isolation) ⁴

¹ Not required in the USA.

Modem Configuration Recommendations

See "Modem Strapping Configuration Log" located inside the modem top cover. More comprehensive strapping information is to be found in the Operating and Service Manual, (37220-90000).

Hewlett-Packard 37230T Modem

Type of Modem	Synchronous	
Type of Line	Four or two wire leased/private Lines. Must be unloaded metallic circ	uit.
Transmission Rate	19200/9600/4800/2400 bits per second.	

Internal Strapping Options

Internal straps tailor modem operation to suit the particular installation. Full details of all internal straps and their recommended setting are contained in the *Operating and Installation Manual* (37230-90000). The "Modem Strapping Configuration Log", located on the underside of the modem top cover, also contains details of all internal strapping and should be filled in at time of installation to document the actual modem strapping.

Options

Option 001: DTE Control of Loopback.

Allows the local data terminal equipment to control the loopback features on the local modem.

HEWLETT-PACKARD MODEM TESTS

Self Tests for 37210T Modems

The following self tests can be used by the customer or CE to determine if a data transmission problem exists between two modems, and to isolate the fault to either the modems or telephone lines.

- Tests 1 and 2 should be performed at all suspect modem sites.
- Test 3 should be performed on 4-wire installations only.
- Test 4 should be performed at all 2-wire installations.

On modems fitted with option 005 the remote modem can be controlled from the local modem using the Remote Command Assembly.

Test 1. Lamp Test

- 1. Depress the LP pushbutton.
- 2. If any of the front panel indicators fails to illuminate, the modem is faulty.

Test 2. Local Analog Loopback Test

- 1. Depress the AL and TP pushbuttons (DL should not be depressed).
- 2. The LSD indicator should be fully on.
- 3. If the SQM indicator flickers on or remains on, the modem is faulty. The indicators should be observed for at least 30s.
- 4. Return the modem to normal operation by releasing the TP and AL pushbuttons.

Test 3. Remote Digital Loopback Test (4-wire installations only)

- 1. Depress the DL pushbutton at the remote modem.
- 2. Depress the TP pushbutton at the local modem.
- 3. The LSD indicators at both modems should turn on.
- 4 If the SQM indicator flickers on more often than 3 times per 30s period on average, the telephone lines are likely to be substandard.
- 5. Return both modems to normal operation by releasing the DL pushbutton at the remote modem and the TP pushbutton at the local modem.

Test 4. 2-Wire Receive Only Test

- 1. Press the RO pushbutton on the local modem.
- 2. Depress the TP pushbutton at the remote modem.
- 3. The LSD and RXD indicators at the local modem should turn on.
- 4. If the SQM indicator at the local modem flickers on, it indicates a telephone line disturbance. Frequent flickering on of the SQM indicator (more often than 3 times/30s period on average) indicates a substandard telephone line.
- 5. Repeat the test reversing the direction of transmission.

Remote Command Operation

In a point-to-point system remote commands can be sent from either modem to the other. In a multi-point system remote commands can only be sent from the master modem.

Procedure to send remote commands:

- 1. Set the ADDRESS thumbwheel to the address of the remote modem.
- 2. Set the Code thumbwheel to the appropriate code (refer to Table 3-21).
- 3. Momentarily depress the TX pushbutton to transmit the remote command. The TX indicator will light to indicate transmission of the remote command.

- 4. A message confirming receipt of the remote command is transmitted back to the master modem. Receipt of this message is indicated by the TX indicator turning OFF and the ABORT indicator not lighting.
- 5. If the ABORT indicator lights, no confirmatory message has been received by the master modem.
- 6. To resend a command it will be necessary to depress the TX indicator twice, once to clear the ABORT indication and once to transmit the command.

Code Number	Function at Remote Modem
0	Depression of TP pushbutton.
1	Selects 2400 bps data rate.
2	No effect.
3	Depression of AL pushbutton.
4	Remote Command Module transmits 1020Hz tone. Remote Transmitter disabled.
5	Disables transmitter.
6	No effect.
7	Depression of DL pushbutton.
8 or 9	Resets/Clears remote commands.

TABLE 3-21. REMOTE COMMAND CODES

Figure 3-10.

HP 37220T Transmitter and Receiver Front Panels (front cover open)

Self Tests for 37220T Modems

The following self tests can be used by the customer or CE to determine if a data transmission problem exists between two modems and to isolate the fault to either the modem or telephone lines.

Test 1. Local Analog Loopback Test

Test 1 should be performed at all suspect modem sites.

- 1. Set the ALB-NORM-DLB switch to ALB.
- 2. Set the MK-NORM-SP switch to MK.
- 3. If the ERR indicator flickers on or remains on, the modem is faulty. The ERR indicator should be observed for at least 30s.
- 4. Set the MK-NORM-SP switch to SP and repeat step 3.
- 5. Check that the TXD and RXD indicators both light when the MK-NORM-SP switch is set to SP, and both go out when MK is selected.

Test 2. Remote Digital Loopback Test

- 1. Set the ALB-NORM-DLB switch on the remote modem to DLB.
- 2. Set the MK-NORM-SP switch on the local modem to SP.
- 3. Check that LSD turns on steady at the local modern within 9s. If LSD fails to turn on, the phone lines are faulty.
- 4. If the SQM indicator at the local modem flickers on more often than 3 times every 30s on average, the telephone lines are likely to be substandard.
- 5. Set the MK-NORM-SP switch to MK and repeat step 4.
Synchronous Controllers and Modems

Remote Control of Loopback

The 37220T modem has a facility whereby a local modem can control loopback on the remote modem. The loopback returns signals received over the telephone lines either by looping the received phone line signal directly to the transmit phone lines (analog loopback) or by looping the output of the receiver back to the transmitter input (digital loopback).

Only one of these two remote loopback modes can be selected. See Operating and Service Manual for details.

Depression of the TRN pushbutton at the local modem for greater than 3s will cause the remote modem to enter the remote loopback mode. The TST indicators at both modems will also light.

To remove the remote modem from the remote loopback mode, press TRN at aproximately 1s intervals. The TST indicators at both modems should extinguish provided both test switches are in the NORM position.

Figure 3-11. HP37230T Front Panel

Self Tests for HP 37230A

Analog Loopback Test

Should be performed at each modem to check local transmit/receive functions. Failure of this test indicates a faulty modem.

- 1. Depress the ALB and TEST pushbuttons on the modem front panel. Ensure all other pushbuttons are not depressed.
- 2. Check that the ERR lamp is off. If ERR is on or flashes on, the modem is faulty.
- 3. Return the modem to normal operation by releasing both pushbuttons.

Digital Loopback Test (Modems connected by 4-wire only)

Checks out the ability of two modems to transmit and receive data over the telephone network. In a multidrop network this test can be performed only between the master modem and a slave modem. It cannot be performed between two slave modems. Failure of this test and a pass for both modems in the Analog Loopback Test indicates a faulty phone line connection.

1. Depress the DLB pushbutton on the far end modem. Ensure all other pushbuttons are not depressed.

- 2. Depress the TEST pushbutton on the local modem. Ensure all other pushbuttons are not depressed
- 3. Each time an error is detected in the data received at the local modem, ERR will flash on. Occasional flashing on of ERR is acceptable. However, if ERR flashes on frequently or stays on for long periods, a faulty phone line connection is indicated.
- 4. Return both modems to normal mode by releasing both pushbuttons.

2-Wire Test (Modems connected by 2-wire lines only)

This test checks out the phone line connection between two modems operating in a 2-wire network.

- 1. At the local modem remove the wire links between the rear panel TX and RX terminals. Ensure that the 2-wire telephone line is connected to the RX terminals on the modem.
- 2. Depress the TEST pushbuttons on both the local and far end modems. Ensure all other pushbuttons are not depressed.
- 3. Each time an error is detected in the data received at the local modem, ERR will flash on. Occasional flashing of ERR is acceptable. However, if ERR flashes on frequently or stays on for long periods, a faulty phone line connection is indicated.
- 4. Release both TEST pushbuttons and reconnect the wire links between the TX and RX terminals on the local modem.

Remote Control of Digital Loopback

This facility, available only when two modems are connected in a point-to-point arrangement via a 4-wire line, allows an operator at one of the modems to command the far end modem to enter the digital loopback mode.

- 1. Depress the RDL pushbutton on the local modem to command the far end modem to enter the digital loopback mode.
- 2. Check that the RDL indicator turns on at the local modem within 6s. If RDL fails to light and ERR turns on, digital loopback at the far end modem is not guaranteed.
- 3. Releasing the RDL pushbutton at the local modem removes the digital loopback from the far end modem.

CSTRACE FILE

May be utilized by any subsystem that uses the CS drivers. Provides a recorded file of events that have occurred on the communications line.

System Default File Name: CSTRACE

Parameter	Value
formal file designator	CSTRACE
FOPTIONS (14:2) (13:1) (10:3) (8:2) (7:1) (6:1) (5:1) (0:5)	00 (new file) 0 (binary file) 0 (use actual file designator) 0 (fixed length records) 0 (no carriage control) 0 1 (disallow file equation) 0
AOPTIONS (12:4) (11:1) (10:1) (8:2) (0:8)	4 (input/output access) 0 (no multi-record option) 0 (disallow dynamic locking/unlocking) 0 (exclusive access) 0
blockfactor	1

Table 4-1. CSTRACE FILE PARAMETERS AND VALUES

User Defined File Name: FILE CSTRACE=oldfile name

- The trace file is opened for variable length records because each line using it may have different record size requirements.
- A new permanent file will be opened in the system domain each time TRACE is requested.
- If an error occurs when trying to open the trace file, the particular COPEN or CCONTROL intrinsic call will fail.
- If the trace file becomes full, the EOF marker will be moved to the top of the file, and all previous trace information is lost.
- If the system fails while tracing is enabled, the trace file will be closed. Some of the last entries may be lost.

• If a line being closed is the last one using the trace file, the CS/3000 trace facility issues an FCLOSE intrinsic call with the following parameters:

Parameter	Value
filenum disposition SECCODE	trace filenum 1 (save) (0) unrestricted access

LIST FILE

The formal file designator for formatted trace dump output is LIST. The default output file is \$STDLIST. To divert formatted output elsewhere, such as to device class LP, use the following file equation:

:FILE LIST;DEV=LP

There may be a large volume of output generated by the CSDUMP program. You can control the list file output priority, keeping it below the outfence value, and examine selected portions of spooled output by using the supported MPE utility SPOOK.

CSDUMP PROGRAM

Formats and lists the CSTRACE file. It is invoked through:

:RUN CSDUMP.PUB.SYS[,OCTAL][,HEX]
$$\begin{bmatrix} 0 \\ 1 \\ 2 \end{bmatrix}$$

The secondary entry point OCTAL allows you to specify that all raw data will be output in octal, otherwise it will be output in hexadecimal. (The entry point HEX, allowing you to specify hexadecimal for the output, has been retained for backward compatibility to the time when the default was octal.) If you specify PARM=0 or 1 all entries will be output by time; however, if you specify PARM=2 only CS/3000 intrinsics will be output by time.

Various conditions can cause this program to abort. These are indicated in an information error message, and in parameter values of the QUIT intrinsic.

Parameter	Meaning	
1 2 3 4 5 6 7	Illegal dump format request Open failure on trace file Open failure on list file Trace file access error Open failure on temporary file Temporary file access error List file access error

TRACE OPTIONS

Syntax

[,ALL][,mask][,numentries][,WRAP][,filename]

Parameters

ALL	means that all activity is to be traced. Its omission means that only I/O errors are to be traced.
mask	indicates the type of activities to be traced, as follows: %000, or omitted, means use the driver default mask. %001=generate PSTX entries ⁴ %002=generate PSCT,PPOL,PSEL entries ⁴ %010=generate PRTX entries ¹ %010=generate PRCT entries ¹ , ² %040=generate POPR and PEDT entries ⁴ , ² %040=generate INF interconnect entries %100=generate IMF (bisync only) control unit state transition entries. PCMP entries are generated automatically. ³
	 ⁴ This is a default value for the BSC and MRJE protocol; also for HPDLC-I protocol except for POPR and PEDT entries are not applicable and do not appear in the trace file. ² For iMF/SDLC %020 does not generate POPR and PEDT. Rather, it causes the suppression of PSTX, PSCT, PRTX, PRCT, and PSTN entries when the line is idly transmitting RR's. If %020 is omitted, line state has no bearing on tracing. ³ When tracing IMF BSC use mask of %277. When tracing IMF SDLC use mask of %77.
numentries	The value of entries is used to derive the size of trace file record. Trace entries are deposited in a record in a circular manner. A driver dependent default of 24 will be used if the parameter is omitted. The maximum value that may be specified is 248. You must specify <i>numentries=16</i> for X.25. On an INP the maximum is 24. (If <i>numentries:24</i> is requested when tracing on an INP, a warning message will be printed and the maximum default of 24 will be used.)
WRAP	Specifies that if the trace record is full for a given CS intrinsic, previous entries are overlayed. Its absence indicates that succeeding entries will be flushed. This parameter does not affect the EOF marker of the file.
filename	Trace output will be sent to a specified file name which has been previously built. If a file name is not specified, the default destination depends on the communications software product being used. If a trace file exists it will be purged, and a new trace file will be created.

Mnemonic	Entry Type	Definition
POPR	Operation	This type of trace entry is generated each time the physical driver is called upon to perform an operation. The POPR trace entry tells what operation is to be performed. ⁴
PSTN	State Transition Entry	This type of trace entry is generated each time the driver transfers from one internal state to another. The PSTN trace entry tells what event just happened and what action is about to be performed.
PEDT	Editor Entry	This type of trace entry is generated each time a text message or control character sequence is received from the remote station. In the case of a text message, the PEDT trace entry shows the first 13 (for HSI) or 14 (for SSLC or INP) words of the user's buffer; control characters, pad characters and CRC parity sequences are omitted. In case of a control character sequence, the PEDT dtrace entry supplies a mnemonic phase telling what was received. ¹
PRCT	Receive Control Sequence Entry	This type of trace entry is generated each time a control character sequence is received from the remote station. The PRCT trace entry shows (in octal or hexadecimal) byte-for-byte exactly what was received. ²
PSCT	Send Control Sequence Entry	This type of trace entry is generated each time the driver sends a control character sequence to the remote station. The PSCT trace entry shows (in octal or hexadecimal) byte-for-byte exactly what was sent. ²
PRTX	Receive Text Entry	This type of trace entry is generated each time a text message is received from the remote station. The PRTX trace entry shows (in octal or hexadecimal) byte-for-byte exactly what was received. ³
PSTX	Send Text Entry	This type of trace entry is generated each time the driver sends a text message to the remote station. The PSTX entry shows (in octal or hexadecimal) byte-for-byte exactly what was sent. ³

TABLE 4-2. PROTOCOL DRIVER TRACE ENTRY TYPES

РСМР	User Request Completed	This type of trace entry is generated each time a user request (i.e., a CREAD, CWRITE, driver-performed CCONTROL, or CCLOSE intrinsic call) is completed. The PCMP trace entry summarizes the number of text messages sent and received and the number of errors that have occurred, etc.
PPOL	Send Polling Sequence Entry	This type of trace entry is generated each time the driver sends a polling sequence. The PPOL shows the sequence byte-for-byte.
PSEL	Send Selection Sequence Entry	This type of trace entry is generated each time the driver sends a selection sequence. The PSEL shows the sequence byte-for-byte.

TABLE 4-2. PROTOCOL DRIVER TRACE ENTRY TYPES (cont'd)

^aThis entry will not be generated by the SDLC or HPDLC-I protocol.

²For SDLC and HPDLC-I, this entry type is generated each time a frame is received from the remote station (PRCT) or sent to the remote station (PSCT). The PRCT or PSCT trace entry omits the Flag characters and Frame checking sequence (FCS) and shows the first 27 bytes of the I field maximum. One byte of the FCS may appear if the frame doesn't end on a word boundary.

³For SDLC and HPDLC-I, this entry type is generated only when the received frame (PRTX) or the sent frame (PSTX) is longer than 32 bytes. In this case PRTX or PSTX entries will be used to display the remainder of the I field that was not displayed in the entry. Trailing Flag and PCS bytes are omitted except when the frame does not end on a word boundary; then one byte of the FCS will appear.

Mnemonic	Entry Type	Definition
IDC	Driver Called	The entry is generated whenver the driver is called to perform an operation.
IDX	Driver Exited	This entry is generated whenver the driver completes an execution of the main control routines.
IADQ	Add to Queue	This entry is generated whenever the driver adds a request to one of its internal queues.
IRFQ	Remove From Queue	This entry is generated whenever the driver removes a request from one of its internal queues.
IDF	Data Frozen	This entry is generated whenever the driver requests a target data segment to be frozen in memory or to check if a previous request to freeze a data segment has been completed.

TABLE 4-3. INTERCONNECT DRIVER TRACE ENTRY TYPES

IUNF	Unfreeze Data	This entry is generated whenever driver wishes to unfreeze a previous frozen data segment or to insure that a data associated with a request is not frozen by the driver.
INR	New Request	This entry is generated each time the driver begins processing a new request.
IPR	Process Request	This entry is generated whenever the driver processes a request which may be completed immediately (i.e., requires no I/O to INP) or whenever a request requires some preprocessing before I/O is to be done.
IAR	Abort Request	This entry is generated whenever a request is to be hard absorbed.
ISTO	Start Timeout	This entry is generated whenever the driver starts a software timeout on a request.
ISS	Set Status	This entry is generated whenever the request completion status is set.
ICR	Complete Request	This entry is generated whenever a request has been fully completed by the driver and is released to the request initiator.
ICC	Check Completion	This entry is generated whenever the driver calls the physical driver to check I/O completion status and to check for software timeout completions.
IPM	Process Message	This entry is generated each time the power fail recovery routine is called.
IPFR	Power Fail Recovery	This entry is generated each time the power fail recovery routine is called.
ICD	Call Driver	This entry is generated each time the physical driver is called to perform an operation.
IDIO	DO I/O	This entry is generated each time the driver wishes to do an operation which sends a message to INP or moves data between requests
IRB	Illogical Condition	This entry is generated whenever the driver detects an illogical internal condition or receives an erroneous or illogical message from INP.
1	1	

TABLE 4-3. INTERCONNECT DRIVER TRACE ENTRY TYPES (cont'd)

TRACE DUMP ANALYSIS

*** CS TRACE DUMP FACILITY *** TUE, JAN 6, 1977, 12:32 AM TRACE FILE IS CSTRACE.CS30.DC LAST OPENED ON TUE, JAN 6, 1977, 12:01 AM SYSTEM ID=02.66

Figure 4-1. Example of a Trace Listing Header Message

At the start of the trace listing is a header message telling the date and time-of-day when the listing was printed and the fully-qualified name of the trace file being used. The meanings of the three remaining items in the header message (shown in Figure 5-1) are as follows:

LAST OPENED ON date	This tells you the date and time-of-day when the trace was performed.
SYSTEM ID=xx.yy	This tells you the version number (xx) and fix level (yy) of the MPE/3000
	operating system that was being used when the trace was performed.
CS ID=xx.yy	This tells you the version number (xx) and fix level (yy) of the CS/3000
	subsystem that was being used when the trace was performed.

An example of a trace listing is shown in Figure 4-2. The meanings of the items in the trace listing are as follows:

BEGIN TRACING MESSAGE	Specifies the device ldev number.
LINE NUMBER	AFT entry.
LOGICAL DEV. NUMBER	Number as specified during system configuration.
DEV. TYPE	As specified during system configuration. INP=17, SSLC=18, HSI=19
SUBTYPE	As specified during system configuration: 0 Point-to-point switch line (modem) 1 Point-to-point non-switched line (modem) 3 Point-to-point non-switched line (no modem) 7 Non-switched (hardwired) line with Async mode.
VER	CS driver version number.
COPTIONS	See "COPTIONS" later in this Section
AOPTIONS	See "AOPTIONS" later in this Section
DOPTIONS	See "DOPTIONS" later in this Section
NUMBUFFERS	Total assigned to the line.
BUFFSIZE	May differ from configured size due to subsystem requirements (i.e., RJE 3780 = 512 words, etc.).
INSPEED/OUTSPEED	Line input/output speed in characters per second.

Figure 4-2. An Example of a Trace Listing.

MISCARRY

The time out values may change during execution, and may not be operational depending on subsystem and function. MISCARRY format is:

- Logical array
- 0 Number of words of parameter information following this word.
- 1 Parameter type.
- 2-n Parameter value

Repeat the last two fields for each parameter type to be specified, as follows:

TABLE 4-4. PARAMETER TYPES FOR MISCARRY

Туре	Meaning of Value
0	Receive Timeout (seconds) Default = 20*
1	Local Timeout (seconds) Default = 60*
2	Connect Timeout (seconds) Default = 900*
з	Response Timeout (seconds) Default = 3*
4	Line Bid Timeout (seconds) Default = 60*
5	Number of Error Recovery Retries Default = 6
6	 Clear-To-Send. Delay determined by modems Clear-To-Send. Delay value in tenths of seconds.
	On an INP this parameter defines the amount of time the driver will await the expected clear to send change before deciding the modem is broken. The default value is 300 milliseconds.
7	 Data Set Ready. No stabilization time. Data Set Ready. 100 Msec stabilization time after it goes true.
8	 = 0 Transmission mode = full duplex. = 1 Transmission mode = half duplex.
9	 0 Disable MMSTAT trace facility. 0 Enable MMSTAT trace facility (Memory Management). (Not implemented for an INP.)
10	Poll Loop Delay. (.01 sec. each) Delay between iterations through Poll List $(0=\infty)$.
11	Poll Repeat. Number of iterations through Poll List (0=∞). Terminates when station responds or number of passes satisfied.
12	Poll Entry Delay. (.001 sec. each) Delay between polling entries in list. 0 disables timeout.

* A value of 0 will disable timeout.

COPTIONS

A word describing the communications options associated with the line.

- (0:1) inhibit timeout
 - = 0 allow timeout
 = 1 disable all timeouts
- (1:1) ID Sequence Verification
 - = 0 allow the use of ID sequences (both user-supplied and configured defaults).
 - 1 inhibit the use of ID sequences. Any user-supplied or configured default ID sequences will be ignored. (Applies to both local and remote ID sequences).
- (2:1) CS trace
 - = 0 do not invoke CS trace facility.
 - = 1 invoke CS trace facility. See also CTRACEINFO.
- (3:1) :CLINE override
 - = 0 allow CLINE command override = 1 prohibit CLINE command override
- (4:2) Speed Select (European modems only)
 - = 0 use configured default setting
 - = 1 set speed to low speed
 - = 2 set speed to high speed
 - = 3 reserved for future use. Specifying this value causes a COPEN error.
- (6:4) Local Mode ("local" means the station at your end of the line).

0 use configured default setting
1 local is a primary contention station
2 local is a secondary contention station
3 local is a control station on a multipoint line
4 local is a secondary station on a multipoint line
5 local is an HPDLC.System acting as DTE.

- = 6 local is an HPDLC.System acting as DCE.
- = 7-15 reserved for HP use.

A COPEN error will result if local mode is not compatible with either COPEN parameters or configured line values.

(10:6) Transmission code

0 use configured default setting
1 use automatic code sensing feature of driver
2 ASCII
3 EBCDIC
4-63 reserved for HP use

AOPTIONS

A word describing the access options associated with the line.

(0:8) Protocol

= 0 use configured default protocol

- = 1 use BSC protocol
- = 2 use MRJE protocol (Conversational BSC)
- = 3 use HPDLC-I protocol
- = 4 255 reserved for HP use

A COPEN error will result if protocol is not compatible with configured line specification or driver capabilities.

(8:1) Allows the user to choose Alpha and Graphic characters in the phone number specified.

= 0 only numeric and "-" are allowed. (default)
= 1 allows Alpha, Numeric, and Graphic characters.

(9:1) Designates whether or not to delay the INP powerfail recovery. (Necessary for a series 64). No user control; set internally by CS.

= 0 no delay (default) = 1 delay

(10:1) (reserved for future use.)

(11:1) Inhibit Console Error Message

= 0 allow CS to print hardware error message of operator console.

= 1 inhibit CS from printing hardware error message at operator console.

(12:2) Dial type

- = 0 dial on write connect; answer on read connect
- = 1 answer on write connect; dial on read connect
- = 2 dial on write connect; dial on read connect
- = 3 answer on write connect; answer on read connect

(14:1) :CLINE buffer override

- = 0 allow :CLINE override for numbuffers and buffsize.
- = 1 disallow buffer information override
- (15:1) Wait mode

= 0 perform all I/O using NCIO = 1 perform all I/O using CIO¹

¹ Only users executing in privileged mode may open a line with CIO and no buffering.

DOPTIONS

A word describing driver-related options. For the SSLC Drivers and BSC INP Driver, the format of DOPTIONS is as follows:

- (0:1) Reversed for future use.
- (1:1) Delay sequence wait.

= 0 wait on received WACK/TTD sequences.

- = 1 Do not wait on received WACK/TTD sequences.
- (2:1) Poll termination sequence.
 - = 0 Before switching between stations, an RVI is transmitted to return the line to control mode.
 - = 1 Before switching between stations, an EOT is transmitted to return the line to control mode.
- (3:1) Control state listen mode.
 - = 0 While in control state and between user requests the driver listens for any control sequences from the remote.
 - = 1 While in control state and between user requests the driver ignores any control sequences from the remote.
- (4:2) Ending sequence:
 - = 0 Use BSC default (NSW=send EOT; SW=send DLE EOT)
 = 1 send DLE EOT
 = 2 send EOT
- (6:1) = 0 the remote will not send leading graphics = 1 expect leading graphics from the remote
- (7:1) Value of USASCII block check character (bcc).
 - 0 VRC/LRC (non-transparent mode or transparent with header). CRC-16 (transparent mode with no header)
 1 VRC/CRC-16 (non transparent mode)
 - CRC-16 (transparent mode)
- (8:1) = 0 automatic generation of WACK = 1 no WACK will be sent
- (9:1) = 0 automatic generation of TTD = 1 no TTD will be sent
- (10:1) = 0 Do not expect ITB sequences from the remote station.¹ = 1 Expect ITB sequence from the remote station.

^a If an ITB sequence is received, the driver will require a retransmission to properly receive the message. The driver then sets this bit to a one.

(11:2) Message Format Word (MFW)

- = 0 MFW will not be placed into received text nor expected in sent text. CS will use an implicit MFW of 000000 for sent text.
- = 1 MFW will not be placed into received text nor expected in sent text.
 - CS will use an implicit MFW of 100000 for sent text.
- = 2 MFW will be placed into received text and expected in sent text.
- = 3 reserved for future use.
- (13:1) = 0 Multipoint primary station reselects a device for each write request.
 = 1 Multipoint primary station will not reselect a device if a write request follows a read request.
- (14:2) Number of leading SYNs
 - = 0 send four leading SYNs
 - = 1 send eight leading SYNs
 - = 2 send twelve leading SYNs
 - = 3 send sixteen leading SYNs

For the HSI Driver, the format of DOPTIONS is as follows:

- (0:1) Reserved for future use.
- (1:1) Delay sequence wait
- (2:1) Ignored
- (3:1) Control state listen mode

 0 while in control state and between user requests the driver listens for any control sequences from the remote. Receipt of a line bid causes the line to be placed into text state.
 - = 1 while in control state and between user requests the driver ignores any control sequences from the remote.
- (4:2) Ending sequence:
 - = 0 use BSC default (NSW=send EOT; SW=send DLE EOT)
 - = 1 send DLE EOT
 - = 2 send EOT
- (7:1) Ignored
- (8:1) = 0 automatic generation of WACK. Enable. = 1 no WACK will be sent. Disable.
- (9:1) = 0 automatic generation of TTD. Enable. = 1 no TTD will be sent. Disable.
- (10:3) Ignored
- (13:1) Reserved for future use.
- (14:2) Ignored

Most of the remaining Line Information Display (Figure 4-2) entries are self-explanatory.

For the HPDLC-I INP driver the format of DOPTIONS is as follows:

(0:1) Looped back mode:

0 = normal. 1 = looped back.

(1.1) Satellite simulation mode:

0 = normal. 1 = simulate satellite delay.

- (2:6) Reserved.
- (8:8) Maximum number of outstanding frames. This is parameter K in the HPDLC-I protocol. Valid values are one through seven. (Default is seven).

DOWNLOAD FILE	The file that is bein	g downloaded
DRIVERNAME	The name of the lir	ne driver being used.
CTRACE INFO		
	ENTRIES	The number of entries per record.
	MASK	The binary specification of the events to be traced.
	TYPE OF TRACE	Type of trace indicates whether ALL or I/O errors are to be traced, and whether the Trace file is to be overlayed, WRAP.
POLITST	A set of multipoint	station identifiers used for colling
FOLLIST	A set of multipoint	station identifiers used for pointig.
PHONELIST	A set of telephone numbers to be used to prompt for dialing a switched line connection.	
IDLIST	A set of identification characters to be sent and to be received. RJE/3000 will send an ID sequence, but not receive them.	
SUPLIST	The maximum set of groups, stations, and components which will be recognized on a multipoint line.	
ERRORCODE	A specification of the type of error which occurred.	
MSGSENT/MSGRECV	Number of blocks c	orrectly received or sent and acknowledged.
RECOVERRORS	Number of errors d	uring entire TRACE duration.
IRRECOVERRORS	RORS Note the subsystem may fail due to satisfactory Bisync conditions which may abort the job, but still not be considered an irrecoverable error (i.e., receive a DLE EOT).	

CS ERRORS

The CS error codes are returned in the *errorcode* parameter in a procedure call to CCHECK. Irrecoverable errors are returned in *errorcode*(8:8), while recoverable errors are returned in *errorcode*(0:8).

Range	Description	
0	Request completed successfully.	
1-40 An error was found by the COPEN intrinsic.		
41-50 The request was not initiated because of an error found by the CS intrinsic (including COPEN).		
51-81 The request as not initiated because of an error found by the CS intrinsic (except COPEN).		
84-109 A hardware error occurred or INP self test failed.		
110-113 INP trace process detected error.		
115-124	Main frame IC detected error.	
151-200	151-200 An error or exceptional condition which resulted in the line being disconne which is driver dependent, occurred.	
201-250 An error or exceptional condition occurred which did not result in the being disconnected, which is driver dependent occurred.		

TABLE 4-5. IRRECOVERABLE ERRORS

Refer to Section 5, "Data Communications Troubleshooting Guide", for the causes and recovery for these error codes.

Code (Decimal)	Meaning		
0	Request completed successfully.		
1	None, or too many groups.		
2	None, or too many stations.		
3	None, or too many components.		
4	Invalid poll or selection sequence length.		
5	Not enough stack space for COPEN to process.		
6	Invalid driver name.		
7	Driver not found in system.		
8	Driver not compatible with attributes of the line.		
9	The line was not configured to allow for changeable drivers.		
10	Undefined line device.		
11	Line device not available.		
12	Not a CS line device.		
13	CS line device in use.		
14	Invalid ID sequence length. It exceeds 16 characters.		
15	Invalid buffer size. It exceeds configured device maximum.		
17	Invalid telephone number length. It exceeds 20 characters.		
18	Illegal character in telephone number. Only numerics or a hyphen character are allowed.		
19	Local mode not compatible with line type.		
20	Invalid information value in MISCARRAY.		
21	Invalid information value in MISCARRAY.		
23	Invalid entry in the poll list		
24	Could not open trace file		
25	Trace process unable to get, lock, or freeze extra data segment. [Trace file record size was too small] [Insufficient trace buffer space.]		

TABLE 4-6. CODE MEANING OF IRRECOVERABLE ERRORS

Code (Decimal)	Meaning		
26	Invalid user capability. User does not have CS capability.		
27	Invalid line designator.		
28	No line designator or device specified.		
29	Too many files or lines. Insufficient PCBX space.		
31	Insufficient main memory space.		
32	Driver failed to open		
33	Local mode was control station, but the SUPLIST=parameter was not specified.		
35	Down load file error.		
38	Mainframe trace process not created or active.		
39	Not enough INP buffer space.		
40	Must have an INP with an autodialer.		
41	Does not have autodial capability		
47	Unable to lock code in memory.		
48	No memory space available for tracing and/or buffering.		
49	DB register not pointing at stack.		
50	Process handling capability needed to trace.		
51	Invalid line number. No such line.		
52	Invalid parameter value.		
53	Trace process detected a read error.		
54	Autodialer detected errors.		
55	No phone list exists.		
56	Invalid buffer count parameter.		
57	Console operator replied NO to a dial prompting message.		

TABLE 4-6. CODE MEANING OF IRRECOVERABLE ERRORS, (cont'd)

Code (Decimal)	Meaning	
58	No telephone number list for dial attempt.	
59	System problem with dial message	
60	Invalid array length parameter.	
61	CCONTROL code value invalid.	
62	The device must be an INP.	
63	No I/O in progress to abort.	
64	Abort ignored because I/O already completed or aborted.	
65	Logical group number value is invalid	
66	Logical station number value is invalid	
67	Logical component number	
68	Non-existent phone index specified.	
69	Phone number specified is not the same length as the current phone number.	
70	Maximum allowed outstanding writes exceeded.	
71	Maximum allowed outstanding reads exceeded.	
72	Current phone index doesn't exist.	
73	Parameter bounds violation	
74	No CS buffers remaining.	
76	Required buffer parameter absent.	
77	Too many I/O requests. IOWAIT needed. Or, concurrent I/O in progress.	
78	No I/O pending for any file or line.	
79	No I/O pending for specified file or line.	
80	Illegal operation of INP device.	
81	File system error in INP dump.	
82	Unexpected INP Shutdown	

Code (Decimal)	Meaning		
83	INP System failure		
84	INP USYNRT failure with DMA.		
85	INP parity error.		
86	INP RAM software error		
87	INP received invalid self-test control character.		
88	INP DMA self-test error.		
89	INP microprocessor (MC2) failure.		
90	INP ROM failure.		
91	INP RAM failure.		
92	INP USART transmitter overrun.		
93	INP USART parity error.		
94	INP USART self-test receive error.		
95	INP USYNRT self-test transmitter underrun.		
96	INP USYNRT self-test receive error.		
97	INP USYNRT self-test receive overrun.		
98	INP USYNRT self-test receive aborted.		
99	INP USART self-test received no data.		
100	INP raised RTS but no CTS from modem. (SNA PU2 only)		
101	Non-responding device.		
102	Data transfer error		
103	Data set not ready.		
104	Carrier lost.		
105	Data overrun		
106	INP USYNRT received no data.		

Code (Decimal)	Meaning		
107	INP USART failure with DMA		
108	INP timer failure.		
109	INP RAM parity error.		
110	INP has no memory for trace buffers.		
111	Illegal number of trace buffers requested for INP		
112	Illegal start or stop requests for INP trace.		
113	Illegal trace record size value specified for INP.		
114	The device must be an INP		
115	Power failure during down load.		
116	Mainframe IC driver timed out.		
117	Invalid interrupt.		
118	Start or stop I/O program error.		
119	Power failure recovery error.		
120	Internal driver error.		
121	ROM self test error		
122	HP IB error.		
123	GIC error		
124	Reset while in RAM or ABORTIO. If an ABORTIO is successful, every new request will be completed with CSERR 124. Any current request will be completed with CSERR 201. If the driver is requested to reset the board when the board is downloaded, then every request will be completed with CSERR 124.		
130	INP system failure. Highest value.		
151	Connect timeout occurred.		
152	Line bid not received.		
153	Remote station rejected the connection.		

Meaning Code (Decimal) Power failure occurred. 154 Local timeout occurred. 155 An internal error was detected by the driver. 156 157 Remote station protocol error occurred. Remote station sent shutdown sequence and disconnected. 158 Remote station sent shutdown sequence and disconnected before the I/O 159 request was issued. An internal error was detected by MPE. 160 161 Initialization timer expired. Operation aborted. 201 202 Invalid request detected by the driver Remote station is not ready to accept line bid. The remote station sent a NAK 203 in sequence in response to the local line bid. Remote station rejected the line bid. 204 Remote primary station bid for the line while. 205 Remote has requested to send. (An RVI sequence was received.) 206 207 Driver retry counter exhausted. Unexpected text was received. 208 Receive timout expired while waiting for text from the remote station. 209 Remote station sent end-of-transmission 210 Remote station sent end-of-transmission sequence, and disconnected before the 211 I/O request was issued. During the execution of a CWRITE conversational with the output buffer to be 212 the input buffer also, the remote requested a resend of the output buffer; but, its contents had been modified while receiving from the remote. Remote station sent an ACK in response to local CREAD acknowledgement. 213

Code (Decimal)	Meaning	
214	Remote station sent a NAK in response to a local CREAD acknowledgement.	
215	Remote station sent an RVI sequence in response to a local CREAD acknowledgement.	
216	Remote station requested a download sequence be initiated.	
217	No line bid was received from the remote station; local station timed out.	
218	Remote sent a delay sequence instead of the expected text or response.	
219	The entries in the pollist were polled the required number of times and no station responded.	
220	An EOT was received from the remote station before the last block of multiblock transmission was sent.	
221	After an RVI was sent to the remote station, it responced with text instead of the expected EOT.	
222	All stations on a multipoint line are down.	
223	Too much data was transmitted by the remote station. Part of the data was lost. Buffer overflow.	
224	All stations on a multipoint line are logically down.	
225	Pollist Entry Set down after not responding for specified number of retries.	
226	INP inactivity timeout. DSMonitor reissues CREAD if still alive.	
230	Bad P2 parameter on a Write Request.	
231	SNA Link attempted to send unsolicited XID to host.	
250	Unable to lock code in memory.	

TABLE 4-6. CODE MEANING OF IRRECOVERABLE ERRORS, (cont'd)

Code (Decimal)	Meaning	
0	No recoverable error occurred.	
1	Invalid ID sequence received	
2	Received unintelligible sequence.	
3	Block check character of field check sequence error.	
4	Response timeout occurred.	
5	Received incorrect acknowledgement.	
6	Remote station attempted to bid for the line.	
7	Remote station did not respond to the local line bid.	
8	Received unintelligible sequence after sending text.	
9	Received inquiry character after sending text.	
10	Remote station requested a resend of the last local response.	
11	Remote station requested a resend of the last text block.	
12	Received end-of-transmission character while in control state.	
13	Received text overflow.	
14	Data overrun occured on SIO multiplexor.	
15	Transfer error occurred on the SIO multiplexor.	
17	Data underrun on INP interface board.	
18	Host sent invalid data to 3270 station.	
19	Requeue 3270 screen for transmit or IMF had to NAK Host Transmission.	
20	Link Reset by Host SNRM.	

TABLE 4-7. RECOVERABLE ERRORS

The recommended action for the following System Failure Codes (Table 4-8) is to perform a cold dump and forward it to HP for analysis.

Code (Decimal)	Meaning	
900	I/O request no longer associated with process.	
902	Unable to freeze of lock a code segment in main memory.	
903	Unable to lock or unlock a segment in main memory.	
904	Unable to increase a data segment size	
905	Unable to decrease a data segment size.	
906	Unable to unfreeze a code segment in main memory.	
907	Unable to unlock a code segment in main memory.	
909	909 Invalid pointer to poll list entry.	
910	Invalid IO queue index value	
911	911 IO queue value cleared after return from MMSTAT procedure	

TABLE 4-8. SYSTEM FAILURE CODES IN CS

TABLE 4-9. DATA COMMUNICATIONS FILE SYSTEM ERRORS

- 201 Invalid ID sequence (FSERR 201)
- 202 Invalid telephone number (FSERR 202)
- 203 No telephone list specified (FSERR 203)

:CLINE, :CRESET, and :SHOWCOM

CLINE Parameters

~

This command can only be issued against a datacomm subsystem which runs on the user's stack (such as RJE), not against one that runs as a system process.

NOTE

This command can only be issued against a datacomm subsystem which runs on the user's stack (such as RJE), not against one that runs as a system process.

SHOWCOM

:SHOWCOM *ldev*[;ERROR][;RESET]

• Idev is the logical device number of a communications controller. ERROR will produce a more detailed display of errors. RESET will clear totals.

Use of this command must be specifically allowed.

	Control Code	Parameter	Comments
F	0	0	aborts all outstanding I/O
	0	-n	aborts the n'th oldest read request
	0	+n	aborts the n'th oldest write request
	1	none	reset the line from text state to control state. Send an EOT to the remote.
	2	none	disconnect the line. Send an EOT, or a DLE EOT, depending on DOPTIONS. $(4:2)$, and if CCONTROL $(.258)$, has been issued.
	32	parameter	changes the index into the phone list to the parameter supplied.
	33	parameter	inserts an entry into the poll list of a multipoint line. The parameter value is the entry to be inserted.
	34	parameter	deletes all occurrences of the entry, parameter, from the pollist.
	35	parameter	change poll list index value
	36	0	reset dialing convention to dial on write connects; answer on read connect.
	36	1	reset dialing convention to answer on write connect; dial on read connect
	36	2	reset dialing convention to dial on write connect; dial on read connect
	36	3	reset dialing convention to answer on write connect; answer on read connect
	37	0	disable receive timeout
	37	-1	set receive timeout to its default of 20 seconds
	37	>0	set receive timeout to parameter value.
	38	0	disable local timeout
	8	-1	set local timeout value to its default of 60 seconds.
	38	>0	set local timeout to parameter value.
	39	0	disable connect timeout

TABLE 4-10. CCONTROL CODES

Control Code	Parameter	Comments
39	-1	set connect timeout value to its default of 900 seconds
39	>0	set connect timeout to parameter value
40	>0	change to number of driver error recovery retry attempts.
41	1	set local station to a primary contention station
41	2	set local station to a secondary contention station
41	3	set local station to a control station
41	4	set local station to a 3270 secondary contention station
41	5	set local station to DTE
41	6	set local station to DCE
42	result	read line state result. (0:8) reserved result. (8:8) = 0,unconnected 1,control 2,text
43	none	disable tracing
44	required	enable tracing parameter(0)=CTRACE INFO of COPEN parameter(1)=trace file designator first word
45	required	return current remote id sequence parameter(0)=length parameter(1)=remote id sequence
46	0	change IO specification to NCIO
46	1	change IO specification to CIO
47	0	disable response time out
47	>0	set response time out, in hundredths of a second
48	0	disable line bid time out
48	>0	set line bid timeout value, in seconds

TABLE 4-10. CCONTROL CODES (cont'd)

Control Code	Parameter	Comments
49	0	disable MMSTAT trace
49	1	enable MMSTAT trace
50	result	current id in configured list result=-1, current ID not in configured list result=0, zero length current id not in configured list result=1, zero length current id is in configured list result=2, non-zero length current id is in configured list
51		setup all components of poll list
52		return last transmission log
53		dump INP RAM
54	result	find configured buffer size for multipoint
55	result	find amount of buffer space available on the INP board
56	result	return current ROM status of the INP board
57	required	send status and sense words down to the INP board for IML
256	p.(15:1)=0	disable automatic generation of WACK
256	p.(15:1)=1	enable automatic generation of WACK
256	p.(14:1)=0	disable automatic generation of TTD
256	p.(14:1)=1	enable automatic generation of WACK
257	0	set VRC/LRC for non-transparent, and CRC-16 for transparent text
257	1	set VRC/CRC-16 for non-transparent, and CRC-16 for transparent text
258	0	sent EOT for non-switched and DLE EOT for switched for disconnect
258	1	always send DLE EOT for disconnect
258	2	always send EOT for disconnect
259	0	do not expect ITB from remote station
259	1	expect to receive ITB from remote station

TABLE 4-10. CCONTROL CODES (cont'd)
Control Code	Parameter	Comments
260	0	CREAD will be executed normally
260	1	The next CREAD will use an RVI instead of an ACKO or ACK1
260	2	The next CREAD will use a NAK instead of an ACK0 or ACK1
261	0	MFW will not be placed into received text nor expected in sent text. The implicit value will be 0.
261	1	MFW will not be placed into received text nor expected in sent text. The implicit value will be %100000.
261	2	An MFW will be placed into word 0 of the user input buffer, and expected in word 0 of the user output buffer.
262	0	disable download mode
262	1	enable download mode
263	result	read download byte into result. (8:8) and clear result. (0:8)
264	0	while in control state listen mode accept control sequences. Receipt of a line bid puts line into text state.
264	1	while in control state listen mode and between user requests ignore control sequences.
265		an IML screen is ready for transmission
266		the IML screen (printer) is busy
267		the IML-emulated printer device has finished
268		an IML-ready screen has been aborted

TABLE 4-10. CCONTROL CODES (cont'd)

INP DUMP FACILITY

INP dump analysis is done only by factory level support personnel. The messages at the sytem console announcing board failure and dump are

INP BOARD FAILURE - LDEV 2020

where xx is a logical device number.

INP RAM DUMPED IN INPLOGNN

STORE AND PURGE ALL INPLOGNN FILES

where nn identifies a dump file created in the PUB group of the SYS account.

Formatted output of an INP dump file, identified by the console messages above, is done as follows:

Omit the following to default output to \$STDLIST, or divert output to device class LP.

:FILE INPLIST; DEV=LP; CCTL

Identify the file to be formatted, such as the one indicated in a console message.

:FILE INPDUMP=INPLOGnn.PUB.SYS

Execute the dump file formatter.

:RUN INPDPAN.PUB.SYS,FULLDUMP

You can store all INP dump files with the following commands:

:FILE INPTAPE;DEV=TAPE :STORE INPLOG##.PUB.SYS;*INTAPE

Once you have finished using INPLOGnn dump files, remember to purge them, because their numbers are limited. The system can build up to 99 INP log files.

Refer to Section 2, "Asynchronous Controllers and Modems", for more information.

CSLIST

CSLIST allows the user to obtain a list of the version, update, and fix (VUF) of the installed CS modules. It also shows the VUF of the latest release of the CS modules to verify that the installed CS modules are current.

In addition, CSLIST allows the user to obtain information for the HP-Standard or user-designated INP download files. This information includes Download File Name, Protocol Type, Board Type, Compile Date, and four version numbers - IC, Protocol, Trace, and RamCP. The information for the HP-Standard download files is accessed through the normal processing of CSLIST. In order to input specific download files names, use the CSLIST entry point INP.

Operation

Standard User Mode

- 1. The program is executed by a :RUN CSLIST.PUB.SYS command. A header is printed out followed by a short explanation.
- 2. DO YOU WANT A COMPLETE LISTING OF INSTALLED VUFS? is asked. Possible responses:
 - YES (or Y) A complete listing is produced.
 - NO (or N) VUFs of only non-current modules are listed.
- 3. DO YOU WANT THE INP DOWNLOAD FILE INFORMATION? is asked. Possible responses:
 - YES (or Y) A listing of the information for the HP-Standard download files is produced.
 - NO (or N) No listing is produced.
- 4. SHOULD OUTPUT BE DIRECTED TO THE LP? is asked. Possible responses:
 - YES (or Y) Output is directed to the system line printer (LP). If no :FILE LP equation exists, the file LP defaults to device class LP i.e., :FILE LP; DEV=LP is assumed.
 - NO (or N) Output is directed to \$STDLIST.
- 5. The requested listings are now produced and sent to the correct output device. A total count of CS modules that do not have a current VUF is printed on \$STDLIST. Any errors encountered while processing the download file information are printed to \$STDLIST and to the LP, if output has been directed there (see Error Messages below).

Special Mode

Used to access information on specific download files.

- 1. The program is executed by a :RUN CSLIST.PUB.SYS, INP command. A short explanation is printed.
- 2. SHOULD OUTPUT BE DIRECTED TO THE LP? is asked. Possible responses:
 - YES (or Y) Output is directed to the system line printer (LP). If no :FILE LP equation exists, the file LP defaults to device class LP i.e., :FILE'LP; DEV=LP is assumed.
 - NO (or N) Output is directed to \$STDLIST.
- 3. The prompt DOWNLOAD FILE NAME = is asked. Possible responses:
 - EXIT (or E, e, exit, //, or carriage return) Program terminates.
 - filename A listing of the information for this download file is produced on the requested device and the prompt is repeated.

Error Messages

These are produced during the search for download file information.

Most of the recoverable and irrecoverable errors possible when running this program are self-explanatory. However, the user should take note of the following mesages:

INVALID ADDRESS ON (filename)

An invalid address was encountered while following the pointers around the download file to access the miscellaneous information. Probably this download file is not in a format compatible with CSLIST. Make sure the download file is from CS release 5.04 or later. Although some information may be printed, it may be incorrect if the file is not in the correct format.

FOPEN ERROR ON (filename)

The program was not able to open the designated file - probably because the file does not exist.

FILE (filename) INVALID TYPE

The designated file does not pass the download file verification tests.

THE BASICS

What is Needed in General

- The version of MPE that is on the system,
- The MPE I/O configuration,
- What hardware is being used,
- That the problem is not already listed in the Software Status Bulletin (SSB),
- That the product is right for the application,
- The symptoms of any operations that have been done,
- The results of any testing that has already been done, and
- Bring a tape copy of all debugging files (unformatted) back to the sales office.

What is Needed for the Specific Data Communications Products

DSN/DS (Distributed System)

- Versions and fix levels of DS and CS of both sides from CSLIST and DSLIST,
- Accurate description of the datacomm network on both sides including controller switch settings and cable numbers,
- · Pertinent console messages from both sides,
- Error messages reported to the user, and
- Trace with ALL parameter.

DSN/X.25 for the HP 3000 (Distributed Systems)

- Versions and fix levels of X.25 and CSLIST of both sides from CSLIST and DSLIST,
- Accurate description of datacomm network on both sides including cable numbers and NETCONF configuration,
- · Pertinent console messages from both sides,
- · Error messages repeated to the user,
- Trace messages with ALL parameter and numentries=16, and
- List of PDN specific diagnostic codes.

DSN/IMF (Interactive Mainframe Facility)

- Version numbers of modules from CSLIST,
- IMF configuration file,
- Description of screen or print file on real device,
- · Host type,
- Trace with mask of %277 for BISYNC,
- Trace with mask of %77 for SDLC,
- MONDUM@. PUB. SYS file if IMF terminated abnormally, and
- INPLOG@. PUB. SYS file if INP board failure occurred.

DSN/MRJE (Multileaving Remote Job Entry)

- Version numbers of modules from CSLIST,
- MRJE versions numbers from MRJECONTROL CHECK,
- MRJE configuration file,
- · Copy of print banner (if applicable),
- Copy of MRJE message file,
- · Copy of console messages,
- Host type, and
- Trace with ALL parameter.

DSN/MTS (Multipoint Terminal Software)

- Version number of MTS,
- Models of terminals and modems involved, and
- · Complete description of network hardware.

DSN/RJE (Remote Job Entry)

- Version number of CS from CSLIST or RJINFO,
- Version number of RJE,
- · Listing of command file and/or console session,
- RJINFO list,
- Remote or host type, and
- Trace with ALL parameter.

TERMIO (Terminal I/O)

- MPE version,
- TERMIO patches level applied,
- ATC, ADCC or ATP,
- 3-wire (RS-232-C), 5-wire (RS-449), or modem, and
- Terminal models.

Modems

- Manufacturer,
- · Model,
- Speed,
- Synchronous or asynchronous,
- Type of phone line or wire, and
- Communications software.

THE METHOD

THE SYMPTOMS

Figure 5-2. Questions to Help Choose a Symptom Table

The symptom tables begin on the next page and are listed in the following order:

Table 5-1. Symptoms for a New Installation	5-7
Table 5-2. Symptoms for a System with Changed Software	5-9
Table 5-3. Symptoms for a System with Changed Hardware	5-12
Table 5-4. Symptoms for a System with No Changes	5-14

Newly Installed Hardware and Software

Limited to symptoms encountered prior to getting the line open.

Product	Symptom	Possible Causes
DS	Console locked, hung console, System Failures	Software installation bad
	DSCONTROL command hangs	Configuration bad
X. 25	DSCONTROL command hangs	Configuration bad
	CSERR 161	Cable problems, PDN or remote HP 3000 in hardwired connection not responding.
RJE	Aborts	MPE resource problem or user written procedure error
	Host shuts line	Line or modem problem, sign on procedure error, or host configuration
	Host will not take input	Line or modem problem, sign on procedure error
	Line closes	Line or modem problems
	No output	Host not sending data or sign on procedure error
	Poor response	Host busy, HP 3000 busy, or line problems
MRJE	Aborts	MPE resource problem or user written procedure error
	Host shuts line	Line or modem problems, sign on procedure error, or Host configuration
	Line closes	Line or modem problems
IMF	Cannot connect or sign on	Configuration files
an an an Ara	Printer problems	Host compatability
	Screens do not work	Screen design error
	Various problems	Configuration files, request aborted by Host, application wrong, IMF is not a 3270 Host configuration

TABLE 5-1. SYMPTOMS FOR A NEW INSTALLATION

Product	Symptom	Possible Causes
MTS	Cannot open line	Software bad, controller or modem problem
	Cannot open MPMON	MPE resource problem
	CS117	INP switches wrong, cable bad, or MPE config
TERMIO	Can only logon at one speed	MPE configuration, terminal switches or configuration
	Cannot logon	MPE configuration, terminal switches or configuration, cable or controller problem
	Remote spooled printer problem	MPE configuration, printer switches, modem or cable problems
	System failures or SF 700-701, 704-706, or 709	Software installation bad
	SF 703, 708, 710	Configuration bad

TABLE 5-1. SYMPTOMS FOR A NEW INSTALLATION (cont'd)

Changed Software

(The hardware is unchanged.)

Product	Symptom	Possible Causes
CS	CSERR 6-7	Software or configuration problem
	CSERR 8-10	Configuration
	CSERR 11-13	Operator procedure
	CSERR 14-19	Configuration
	CSERR 57-58	Operator procedure
	CSERR 153	Operator procedure or remote device problem
	CSERR 154	Hardware
	CSERR 156	Software
	CSERR 157-159	Remote device
	CSERR 158	Operator procedure or remote device problem
	CSERR 201	Operator procedure
	CSERR 203-204	Remote device
	CSERR 205-207	Operator procedure
an a	CSERR 207-209	Hardware, line, or modem problems
	CSERR 207-217	Remote device
	CSERR 212-214	Hardware
	CSERR 217	Hardware
DS	DSCONTROL fails with CIERR 4152 or 4153	Software installation bad
a in start	DSCOPY aborts	Software bad
	Line closes or poor response	Configuration problem

TABLE 5-2. CHANGED SOFTWARE SYMPTOM TABLE

Product	Symptom	Possible Causes
DS (cont'd)	Sessions hang	DSMON bad, programs not compatable with new, or MPE version
	System failures	Software installation bad
X. 25	DSCONTROL fails with CIERR 4152 or 4153	Software installation bad
	DSCONTROL hangs	Configuration bad, NETCONF bad
RJE	Aborts	MPE resource problem or user written procedure error
	Cannot sign on	Sign on procedure
MRJE	Cannot open line.	Software installation bad
	Cannot sign on.	Configuration file
	Did not get host number back	Message modified, cannot read
	Job management does not work	Job log corrupted, did not get host number back, banner messed up, configuration file corrupted, RMT# changed or wrong.
	MRJE user errors	New user commands
	No input taken by host	User sign on procedure
	No output	User sign on procedure
	Only one input or output set	Host configuration changed
	Printer problems	Out of disc space Spooler space problem
IMF	Cannot connect or sign on	Configuration files
	Printer problems	Host compatability
	Screens do not work	Screen design error
	Various problems	Configuration files, request aborted by host, application wrong, or IMF is not a host configuration

TABLE 5-2. CHANGED SOFTWARE SYMPTOM TABLE (cont'd)

Product	Symptom	Possible Causes
MTS	Cannot open line	Software installation bad or download file bad
	Poor response	Configuration file or software error, or MPE buffer size.
TERMIO	Can only logon at one speed.	MPE configuration
	Cannot change speed.	MPE configuration
	Hang while running program.	Program busy or program changed terminal or MPE configuration.
	Remote spooled printer problems	MPE configuration
	SF 700, 701, 705, 706	Software installation bad
	SF 708	Configuration bad

TABLE 5-2. CHANGED SOFTWARE SYMPTOM TABLE (cont'd)

Changed Hardware

(same software and configuration)

TABLE 5-3. SYMPTOMS FOR A SYSTEM WITH CHANGED HARDWARE

Product	Symptom	Possible Causes
CS	CSERR 84 - 109	HARDWARE
	CSERR 100 - 105	
	CSERR 117	
	CSERR 154	
	CSERR 207 - 209	
	CSERR 212 - 214	
	CSERR 217	
DS	Line closes	Modem or line problems
	Poor response	Did not change configuration
	REMOTE HELLO fails	Line problems
	Remote system shuts line	Line problems
	System failures	Configuration
X.25	CSERR 161	Cable problems or remote not responding
RJE	Cannot open line	Controller or modem problems
	Cannot sign on	⁻ Host configuration or modem problems]
	Host shuts line	Host configuration, modem, or line problems
	Line closes	Line or modem problems
	No output	Line problems
	Poor response	Line problems

1

Product	Symptom	Possible Causes
MRJE	Cannot open line	Hardware problem
	Cannot sign on	Host configuration changed
	Did not get host number back	Hardware problem
	Host shuts line, Line closes, or Poor response	Line problems
IMF	CSERR 117	Hardware problem
	Host shuts line	Hardware problem
	Poor response	MPE configuration error
MTS	All but one remote drop is dead	Line, terminal, or modem problem
	Cannot logon	Terminal switches or configuration
	Cannot open line	Controller or modem problem
	Commands do not work	Terminal switches or configuration
	Poor response	Hardware problem or line overloaded
TERMIO	Can only logon at one speed	Terminal switches or configuration or MPE configuration
	Cannot change speed	MPE configuration
	Cannot logon	Port hung, DOWNed, REFUSEed, or terminal switches or configuration
	Hardwired worked, but modem will not work	Line or modem problems, cable bad, or port configured wrong
	Remote spooled printer problems	MPE configuration, line or modem problems, printer switches
	SF 208 (HP-IB only)	Nosiy modems or lines, using last port on main with modems

TABLE 5-3. SYMPTOMS FOR A SYSTEM WITH CHANGED HARDWARE (cont'd)

Product	Symptom	Possible Causes
	SF 209	Noisy modems or lines
	SF 211	ADCC hardware problem
	SF 709,715	Software bad
	SF 708,710	Configuration bad
	SF 714-716	Hardware problem

TABLE 5-3. SYMPTOMS FOR A SYSTEM WITH CHANGED HARDWARE (cont'd)

No Changes

Product	Symptom	Possible Causes
CS	CSERR 84-109, 154, 207-209, 212-214, 217	Hardware
	CSERR 11-13, 57-58, 103, 153, 158, 201, 205-207	User error
	CSERR 153, 157-159, 203-217	Remote device
DS	Console locked	Terminal or MPE problems (not DS)
	DSLINE fails	Line not open or open one-way
	DSCOPY aborts	Line errors
	DSCOPY fails	User error, wrong file type, or copy in wrong direction
	Hung session, can not abort	User errors, PTOP program logic, subsystem or application program problem
	Line closes	Line errors
	NFT errors 101-110	Resource or internal software errors
	Poor response	Line errors
	REMOTE command fails	User error, MPE problem, or lack of pseudodevice
	Remote system shuts line	Line problems or hardware failure
	System Failures	Software problems or missing patches or fixes. Take a memory dump.
	Transfer only one-way	Remote configuration problem

TABLE 5-4. SYMPTOMS FOR A SYSTEM WITH NO CHANGES

TABLE 5-4. SYMPTOMS FOR A SYSTEM WITH NO CHANGES (cont'd)

Product	Symptom	Possible Causes
RJE	Aborts	MPE resource or user written procedure problem
	Can not sign on	Sign on procedure, host configuration, or line problems
	Host shuts line	Sign on procedure, host configuration, line or modem problems
	Line closes	Line or modem problems
	No output	Host not sending data or line problems
	Poor response	Host or HP 3000 busy, or line problems
MRJE	Cannot get into console mode	Someone else has console
	Cannot sign on	Host configuration changed, user sign on procedure, or configuration file problems
	Did not get host number back	Message modified, cannot read, or hardware problems
	Host shuts line	Line problems
	Job management does not work	Job log corrupted, did not get host number back, banner messed up, configuration file corrupted, or RMT# changed or wrong
	Line closes	Line problems or host operator shut line
	MRJE console operator errors	File system problems
	MRJE user errors	User error
	No input taken by host	User sign on procedure
	No output	User sign on procedure, host went down, devices not open, or user command error
	Only one input or output set	Host configuration changed
	Poor response	Line problems or systems busy
	Printer problems	Out of disc space, file equation error, spooler space problem, operator inhibited printouts, or printer not ready

Product	Symptom	Possible Causes
IMF	Cannot connect	Line problems
	Cannot sign on	Configuration file
	CS errors (esp. CSERR 117),	Other problems
	Host shuts line	Mismatching config. Host applications does not implement error recovery
	IMF errors	Refer to IMF error numbers
	Line closes	Protocol error, line error
	Poor response	Overloaded line, busy system
	Printer problems	Host or IMF configuration problem
	System failures	Internal software error; take a memory dump
MTS	All but one remote drop is dead	Group DOWNed, or line, terminal or modem problems, or terminal switches or configuration
	Cannot logon	User error, terminal switches or configuration, or MPE resource problem
	Cannot open line	Software installation or download file bad, or modem or controller problem
	Commands do not work	User error or terminal switches or configuration file problem
	Dead terminals, no response	Line not open or line or modem problem
	Hung terminals	Terminal switches or configuration or program problem
	Line shuts	Line or modem problems
	No polling on any terminals	Line not OPENed
	No polling on some terminals	Terminals DOWNed, line or modem problems

TABLE 5-4. SYMPTOMS FOR A SYSTEM WITH NO CHANGES (cont'd)

TABLE 5-4. SYMPTOMS FOR A SYSTEM WITH NO CHANGES (cont'd)

Product	Symptom	Possible Causes
MTS (cont'd)	Polling, no prompts	Terminal switches or configuration, MPE resource problems or system busy
	Polling, some prompts	Some terminals DOWNed
	Poor response	Configuration file error, line overloaded, software error, terminal switches or configuration, modem problems, or MPE buffer size (TBUFs)
	Read or write errors	Line problems
TERMIO	Can only logon at one speed	Terminal switches or configuration
	Cannot get back into block mode	User hit break key
	Cannot logon	Port hung, DOWNED, or REFUSEd, or terminal switches or configuration, or MPE resource problem, or user procedure wrong
	Session logged off	Operator aborted session or BYE in UDC
	Hang while running program	Program busy, program changed terminal configuration, user changed terminal switches, or terminal switches or configuration wrong
	Hardwired worked; modem won't	Line or modem problems or cable bad
	Remote spooled printer problems	Line or modem problems, printer switches, program problem, printer status not checked, or MPE resource problem (TBUFs)
	SF 208 (HP-IB only)	Noisy modems or lines, or using the last port on main with modems
	SF 209	Noisy modems or lines
	SF 211	ADCC hardware problem
	SF 714, 716	Hardware problem
	SF 715	Console hardware problem

Once the symptoms are found and the possible causes are determined, the next step is to check to see which one is really the problem. The problems can generally be put into four groups.

Usage Problems are those arising from improper use of an otherwise working data communications network. For example:

Using wrong parameters Giving wrong reply to dial message Using wrong controller

Protocol problems involve the software that handles the link such as the CS subsystem, CSSBSCO, or the INP. These usually indicate a software or hardware error in the DTE. They may be caused by the user.

Digital problems are in the interface between the DTE and the DCE such as cables, connectors, RS-232-C pin usage, or modem options.

Analog problems are usually called impairments and dwell within the transmission facility. Transmission line impairments come in two types, <u>fortuitous</u> and <u>systematic</u>. The former is relatively similar to an 'acute illness' it comes up suddenly, goes away quickly, and may come back when ever it pleases. Not much can be done about them except to redial the connection and let someone else have the problem. Some categories of fortuitous impairments are:

Noise	electrical disturbances		
Crosstalk	- interference from another channel		
Echo	 reflected signals 		
Loss	- drop in signal power		
Jitter	 instability in frequency shifts 		

The other type of transmission line problems is systematic. These impairments, called distortion, can be corrected by conditioning the line. The are:

Delay - frequencies arrive at different times Attenuation - loss of some frequencies

There are several important steps to checking these causes:

- Verify the results what really happened?
- Verify the software and I/O configuration coldloads and restores can cause accidental destruction of the I/O configuration or system software.
- Actual protocol errors, where there is a bug, may require more extensive testing. If your software is up to date, CSDUMP may show the problem.
- Test the data communications network, modems, and DTE.

Causes and Tests

The following 'Cause Table' lists the possible causes of problems along with the type of cause and the tests used to check them out. Remember, some tests may be as simple as asking someone what they did or checking version numbers.

TABLE 5-5. CAUSES

Cause

Test or Action

ADCC hardware problem

application program problem application wrong ATP problems banner messed up BYE in UDC cable bad

configuration configuration file configuration file corrupted

configuration file error controller problem copy in wrong direction

devices not open didn't change configuration

didn't get host number back download file bad DSMON bad file equation error file system problems group DOWNed hardware

hardware failure hardware problem host busy host compatibility host configuration host configuration changed host not sending data

host operator shut line host went down HP3000 busy improper installation

try another port run ADCC diagnostic check program IMF is not exactly a 3270 run ATPDSM check banner & configuration file examine UDC files check cable part number check cable continuity check configuration check configuration file check configuration file restore configuration file check configuration file run DSM check user procedures for attempts to copy wrong way check remote operator procedure check configuration to be sure all changes were made check host configuration restore from tape check version check user procedures check file error code check console log run DSM run modem selftest run terminal selftest run hardware diagnostics run hardware diagnostics retry later check host specifications check configuration check changes in configuration check host configuration for when host sends or terminates check remote operator procedure call host operator try again later check versions numbers reinstall software

TABLE 5-5. CAUSES (cont'd)

Test or Action

Cause

INP switches internal software errors

job log corrupted

lack of psuedo-devices

line not OPENned line not open line open one way line overloaded line problem

message modified, can't read missing patches or fixes modem problem

MPE buffer size MPE configuration MPE configuration error MPE problem, not DS MPE problem MPE resource problem MPE resource problem (TBUFS) new user commands noisy lines

noisy modems

operator aborted session operator inhibited printouts operator procedure out of disc space out of file space port DOWNed, REFUSEd port configured wrong port hung printer not ready printer status not checked printer status not checked program busy

program changed terminal configuration

check switches for correct setting check SSB reinstall or coldload software check job log clean out job log check configuration add more devices check operator procedure check operator procedure check remote operator procedure check line traffic to speed ration run modem diagnostics run terminal data comm tests run DSM loopbacks run MPTEST over lines check host specifications check patch list in SYS run modem diagnostic run terminal data comm test run DSM loopbacks run MPTEST over lines check configuration check configuration check configuration check SSB check SSB check configuration check configuration check user procedure run modem selftests run modem remote tests run modem selftests run modem remote tests check operator console log do :SHOWOUT SP at console check operator procedure run FREE2 do :LISTF, 2 and run LISTEQ2 do SHOWDEV check configuration run TABLE check printer check program check printer switches wait program to complete I/O, then check for hung terminal causes

check terminal switches/config.

TABLE 5-5. CAUSES (cont'd)

THE TESTS

Data Communications Tests

Usage Tests

Verify user procedures Examine software tables versions configuration configuration files job card, files, logs SSB

Protocol Tests

Check software versions Analyze data stream Verify RS-232-C signals

Digital Tests

Controller software tests Cable tests Modem tests Terminal tests Hardware diagnostics

Analog Tests

Phase jitter Single frequency interference Frequency shift Return loss Envelope delay distortion Frequency response Noise Loss

Each of these test can be used to check out possible causes. Most of them can be done with software diagnostics available on the HP3000. Some require very specialized equipment that is generally used by TelCo personnel. Different tests are performed by a different set of tools.

THE TOOLS

Usage Tools

Usage test tools are usually commands or programs on the HP3000. The major use of these tools is to verify that the system management and users are using the system properly.

Verify user procedures	
CSDUMP	Prints data collected by TRACE facility
TRACE	Records exactly what data went across line
DSDUMP	Side by side trace of DS conversation
MPCONFIG	Will show the poll and downs lists
SHOWME	Shows version number of current MPE
EDITOR	Will list various job stream and UDC files
IMFMGR	Will list parameters for host access
LISTEQ2	Show file equations in effect
Examine software tables	
FREE2	Shows free disc space
SHOWCOM	Shows current errors, retries, status of a line
TABLE	Will display terminal DIT and other table entries
CSDUMP	Will show how the line was openned
DPAN4	Shows all tables at time of memory dump
versions	
CSLIST	Displays version numbers of CS modules
DSLIST	Displays version numbers of DS and X.25 modules
MRJECONTROL, CHECK	Displays version numbers of MRJE modules
MPMON	Displays version number of MTS
configuration	
SYSDUMP	Will show I/O configuration, table sizes
SYSINFO	Will show I/O configuration, table sizes
DSTEST, CONFIG	Shows DS MPE configuration
configuration files	
IMFMGR	Will display and verify configuration files
MPCONFIG	Will display configuration file
job card, files, logs,	other
EDITOR	Will display job files and logs
SSB	Contains known problem information

Protocol Tools

Protocol test tools provide a means for finding the source of problems in the software that handles the link. They may simply check that the right software is on the system or collect the data for the factory to resolve the problem.

Check software versions HP1640 Data Analyzer CSDUMP DSTEST,DIAG HP4955A Verifies what protocol is being used Displays protocol sequences Traces what protocol is being used Tests the DS protocol Protocal Analyzer

Digital Tools

Digital test tools are for testing the interface between the DTE and the DCE. They are usually devices or programs that test the hardware.

Controller software tests

DSM	
Interconnect	Groups 1, 5.1 & 5.2 test communication between INP and the HP 3000
Onboard	Groups 2, 4 and 5 test the USART chips Group 3 tests the memory, Group 2.1 causes the INP Self-Test, and Group 2.2 the microprocessor test.
Offboard	Groups 6 & 7 test the USART with cables or modems
INPDPAN	Processes the INP RAM dump showing protocol and errors
ATPDSM	Tests the ATP hardware and software
<u>Cable tests</u>	
DSM loopback	Groups 6 and 7 test the INP with cables and modems
MPTEST	Will test the complete cabling network for MTS terminals
Breakout Box	Indicates which signals are passing through the cables
Multimeter Terminal data comm	Used for continuity tests
loopback	Test the cables attached to the terminals

Modem tests

Selftest	Hardware within the modem
Digital loopback	Digital interface connections
Analog loopback	Analog (TelCo) interface connections
Remote test	Modems as a set and the TelCo lines

Terminal tests

Selftest	Terminal hardware
Data comm board	Multipoint hardware within the terminal
Data comm loopback	Multipoint cable connections
MPTEST	Shows the strap setting and tests terminal I/O
Display functions	Shows what terminal is receiving
Monitor mode	Shows what is passing through the communications interface
Driver mode	Polls other terminals without computer

Hardware diagnostics

ADCC diagnostic	ADCC hardware
ATC diagnostic	ATC hardware
ATPDSM	ATP hardware
DSM	INP hardware
IOMAP	HP3000 HP-IB system hardware
SLEUTH	HP3000 Series II/III hardware
SSLC diagnostic	SSLC hardware
Data Link Tester	Shows the status of signals on the DATA LINK

Analog Tools

Analog test tools provide the capability to examine the quality of the TelCo line or any privately owned transmission facility. They do this by sending data across the line which is read by another device on the other end or looped back to the originator.

Analog TelCo line tests

Noise and Loss BERT (HP1645) Test of TelCo line and modems MPTEST Extended test of TelCo line DSM Offboard Extended test of TelCo line Modem remote test Pass/fail test of TelCo line Terminal driver mode Extended test of TelCo line TIMS (HP4943,4935) Many extended tests of TelCo line quality Terminal data comm loopback Pass/fail test of TelCo line

TOOL DESCRIPTIONS

This section includes an alphabetic list of tools. It tells what they do, when to use them, where to find them, and where they are documented.

ADCC diagnostic

It is	a set of diagnostics for the ADCC including tests for the IMB handshake logic thru the RS-232-C cable. After loading from the tape, specific tests can be selected. It requires a loopback hood and at least one good ADCC is needed for the console.		
Use it when	a port problem is suspected and nothing else has helped.		
Find it	on the DUS tape.		
Documented	in the Diagnostic Manual Set, Vol. 2.		

ATC diagnostic

It is	a set of offline diagnostics to verify the operation of the ATC ports.	This simple test
	requires only the male-to-male cable that comes with your system.	

Use it when a port problem is suspected and nothing	g else	has	helped.
---	--------	-----	---------

i mu it on the right of a binghouse the	Find it	on the Non-CPU	Diagnostic	tape
---	---------	----------------	------------	------

Documented in the ATC Diagnostic Manual...

ATPDSM

It is	a diagnostic program that provides corrective capabilities for the ATP through easy commands.
Use it when	a port appears to be stuck or the LEDs remain ON after the AIB self test.
Find it	in PUB.SYS.
Documented	in the ATP Diagnostic Manual

BERT (HP1645)

It is	a box for testing the quality of a phone line or modems by sending and receiving test data. One is placed on each end of the line or just one end with the other end in loopback.
Use it when	a line or modem problem is suspected or it is necessary to prove that one exists.
Find it	in HP and other supplier catalogs as HP1645A, Red Box, or BERT.
Documented	in manuals supplied with the device.

Breakout Box

It is	a small box which fits in between two RS-232-C cables that allows monitoring and patching of signals $% \left(\frac{1}{2} \right) = 0$
Use it when	there is doubt that a signal is getting through or a test is to be made prior to modifying a cable
Find it	on the HP parts list or in the International Data Sciences catalog or other catalogs as breakout box, traffic light, etc.
Documented	by instructions that come with it.
CSDUMP	
It is	a program that analyzes the data collected by a TRACE process on one of the data communication lines. It expects to find the file CSTRACE.
Use it when	there is any question as to what is going over the line or you want to determine what a user is sending. It is usually required for factory involvement.
Find it	in PUB.SYS.
Documented	in the RJE Reference Manual, in Section 4 of the Communications Handbook, the DS Network Administrator Manual and the $X.25$ Reference Manual.
CSLIST	
It is	a program to list the version, update and fix levels of the CS modules on the system.
Use it when	wrong software modules are suspected or you want to know what versions are on your system.
Find it	in PUB.SYS.
Documented	In Section 4 of the Communications Handbook.
CSTRACE	
It is	the data file created by the TRACE process for an open line which contains a recent history of the data transmissions that have gone over the line.
Use it when	the subsystem in question is MTS, RJE or IMF; DS uses a file called DSTRCnnn and MRJE uses MRJETRCh, $X.25$ uses DSTRCnn, RJE uses RJETRCn, or RJETRCnn, or RJETRCnnn.
Find it	in PUB.SYS.
Documented	in the RJE Reference Manual, the DS Reference Manual, and in Section 4 of the Communications Handbook.

Data Analyzer (HP1640)

It is Use it when		a protocol analyzer device placed into the RS-232-C line to display the conversation between two devices or to simulate one of them. It also has the ability to trap timing conditions and sequences. the TRACE process does not show the needed information in content or time frame, or the problem is on an asynchronous terminal connection	
Documented	umented in the Data Capture Manual, the Operation Manual that comes with the device, Application Notes 275. See also Table 5-6 which follows.		

Protocal Analyzer (HP4955A)

It is	like an HP1640, but can save trace information on tape. More powerful simulation and monitoring tool than an HP1640.
Use it when	The TRACE process does not show the needed information in content or time frame, or the problem is on an asynchronous terminal connection.
	이 집에 가지 못 한 것을 알려야 한다. 그는 것은 것은 것을 하는 것을 수 없다.

Find it in the HP catalog or at a local HP sales office

Documented in the operation manual that comes with the device.

DPAN4

It is	a facility to analyze a memory dump tape. There is a job stream called DUMPJOB4 which collects additional data from the system such as the loadmap and I/O configuration.
Use it when	any communications subsystem aborts or the system fails
Find it	in PUB.SYS
Documented	in the System Utilities Manual, Software Pocket Guide
DSDUMP	
It is	a CSTRACE analyzer program specifically for DS traces. It prints the DS conversation on alternate sides of the page at the high level of DS protocol.
Use it when	you are troubleshooting a DS problem and want to eliminate the bisync protocol of CS.
Find it	in PUB.SYS
Documented	in newer DS manuals and in data communications training materials for SEs
TABLE 5-6.

SELECTED HP 1640A/B SETTINGS

FORMAT	ATC	ATP/ADCC	ASYNC MTS

SSLC AND INP CONFIGURATION SUMMARY

5-33

DSLIST

It is	a program to list versions of DS and X.25 modules		
Use it when	DS or X.25 software versions are suspected		
Find it	in PUB.SYS		
Documented	in the DS Reference Manual and the X.25 Reference Manual		

DSM Interconnect

It is	the INP diagnostic and test tool Groups 1 thru 5 which do extensive tests of the INP processor and memory
Use it when	the INP fails
Find it	in PUB.SYS
Documented	in the INP Diagnostic Manual supplied with the INP and in the help feature within the program

DSM Offboard

It is	the INP diagnostic and test tool Groups 6 and 7 which provide the capability to test the network external to the INP. It uses loopback connectors and modem loop-backs
Use it when	you want to test cables, modems, or a complete INP to INP connection
Find it	in PUB.SYS
Documented	in the INP Diagnostic Manual supplied with the INP and in the help feature within the program

DSM Onboard

It is	the INP diagnostic and test tool Groups 2 thru 5 which test the boards USART an other datacomm chips. It requires card edge loopback hoods.	d
Use it when	the INP is suspect and the Interconnect tests have passed	
Find it	in PUB.SYS	

Documented in the INP Diagnostic Manual supplied with the INP and in the help feature within the program

-

DSTEST

It is	a program to list versions of DS modules, list the I/O configuration pertaining to DS, and provide online diagnostics over the DS line			
Use it when	DS software versions are suspected want to test the line and software	l, you are in doubt a	ibout the configur	ation, or you
Find it	in PUB.SYS			
Documented	in the DS Reference Manual			

Data Link Tester

It is	a small device used to test the Data Link cable at a connector box for continuity and proper wiring
Use it when	you are installing a Data Link to test your connections and when the data link cable is suspected
Find it	in the Data Link Installation Kit and HP parts list
Documented	in the Data Capture Manual

EDITOR

It is	the text editing facility of MPE	
Use it when	you need to look at an ASCII file such as UDCs or job streams	
Find it	in PUB.SYS	
Documented	in the EDIT/3000 Reference Manual	

FREE2

It is	
Use it when	you are unsure of whether there is sufficient free disc space available to do your job
Find it	in PUB.SYS
Documented	in the System Utilities Manual

a system utility to report on the current status of free disc space on the system

IMFMGR

It is a command for the Interactive Mainframe Facility sub-system which provides the manager of the facility with control over its use and the capability to verify configuration files.

Use it when it is necessary to confirm the contents of a configuration file

Find it as : IMFMGR

in the IMF Reference Manual Documented

INPDPAN

It is	an analyzer for the INP RAM dump. Except for 'status at time of failure,' reading these dumps is usually done by the factory.
Use it when	the CS subsystem has created a RAM dump file for the INP and has notified the operator of its creation
Find it	in PUB.SYS
Documented	in Section 4 of the Communications Handbook and SE data communications training materials
IOMAP	

It is	a diagnostic to identify and checkout the basic I/O system hardware.	This command
	driven program lists the hardware, channels and devices.	

Use it when	the exact I/	O configuration is not l	known
-------------	--------------	--------------------------	-------

in the Diagnostic Manual Set Documented

LISTEQ2

It is	a program to list file equations and temporary files.
Use it when	files don't seem to be going to the right place or in the right fashion.
Find it	in PUB.SYS
Documented	in the System Utilities Manual

MPCONFIG

It is	a program to list, change and create MTS configuration files.
Use it when	you want to view the contents of a configuration file
Find it	in PUB.SYS
Documented	in the MTS Reference Manual

5-36

MPMON

It is	the MTS line supervisor. Running it will display the version number.	
Use it when	the version of MTS is unknown	
Find it	in PUB.SYS	
Documented	in the MTS Reference Manual	
MPTEST		
It is	a testing facility for MTS lines and terminals. It will check terminal strap settings and perform read/write tests of the line, modems and terminals.	
Use it when	a new MTS line is installed to check the terminal straps or a line is not functioning properly.	
Find it	in PUB.SYS	
Documented	in the MTS Reference Manual	

MRJECONTROL

It is	a console operator command used to control the MRJE line. The <i>check</i> parameter will cause a list of version numbers to be listed.
Use it when	the version numbers are unknown or are suspected of being wrong.
Find it	as :MRJECONTROL
Documented	in the MRJE Reference Manual

Modem Analog Loopback

It is a modem capability to connect the analog output and input parts of the modem together to read whatever is written. This tests about 80% of the modem.

Use it when testing data terminal equipment without going over the TelCo line (local test) or the local modern.

Find it as a button or switch somewhere on the modem

Documented in the modem manual. HP modem tests are in Section 2 of the Communications Handbook

Modem Digital Loopback

It is	a modem capability to connect the digital output and input parts of the modem together to return whatever was received. This loopback is necessary to test a TelCo line and is set on the far end modem from either the computer or terminal.	
Use it when	when testing data communitest).	cations equipment by going over the TelCo line (remote
Find it	as a button or switch somew	nere on the modem
Documented	in the modem manual. H Handbook	? modem tests are in Section 2 of the Communications
Modem Remo	ote Test	

It is a modem capability to send data to and receive it back from a remote modem. Some modems have the capability to tell the remote modem to go into loopback. It provides a pass/fail test of the hardware.

- Use it when the TelCo line and modems are being tested independently of the data terminal equipment.
- Find it as a switch or button on the modems
- Documented in the modem manual. HP modem tests are in Section 2 of the Communications Handbook

Modem Selftest

- It is a modem pass/fail test. It will determine if the modem is functioning within specifications.
- Use it when any time there is any doubt. Just push the button; it does the rest.
- Find it as a switch or button on the modem
- Documented in the modem manual, Bell and HP modem tests are in Section 2 of the Communications Handbook

Multimeter

- It is an electronic tool for testing volts and ohms. It can be used to test the continuity of a cable or connector when set to ohms.
- Use it when cables or connections are suspected of being faulty
- Find it in nearly any electronics store
- Documented in the manual that comes with it. Some cables are documented in the DTD Cabling Manual and Section 2 of the Communications Handbook.

SHOWCOM

It is	a console operator command to display the statistics generated for a data comm line such as CS errors, timeouts and retries.
Use it when	the line appears hung, an exceptional number of errors are being encountered, or the last CS error message for the line was lost.
Find it	as :SHOWCOM XX;ERRORS
Documented	in the Console Operator's Guide and in Section 4 of the Communications Handbook

SHOWME

It is	an MPE command to identify the session
Use it when	the current version of MPE is needed
Find it	as :SHOWME
Documented	in the MPE Command Manual

SLEUTH

It is	a diagnostic programming language useful in determining the exact I/O configuration on Series II/III computers.
Use it when	the exact I/O configuration is not known
Find it	on the Non-CPU Diagnostic tape
Documented	in the diagnostic manuals that come with the system
SSB	
It is	the Software Status Bulletin, a publication containing a list of all known problems and enhancement requests. It may have the problem you are troubleshooting already listed with a fix or work around.
Use it when	you first encounter the problem to see if it is already known.

- Find it in the mail from your CSS or SSS contract
- Documented in the Guide to a Successful Installation

SSLC diagnostics

It is	a diagnostic useful in testing the SSLC, cables and modems in the same manner as DS for the INP. It requires loopback hoods and cable connectors or modem loopbacks.	
Use it when	the modems, TelCo lines, or SSLC are not functioning properly	
Find it	on the Non-CPU Diagnostic tape	
Documented	in the diagnostic manuals that come with the system	

SYSDUMP

It is	the MPE configurator. When used with \$NULL as the tape file designator, it provides a
	quick method of finding the exact configuration as MPE sees it.

Use it when the exact configuration is not known

Find	it	as	:SYSDUMP

Documented in the Console Operator's Guide and System Manager Manual

SYSINFO

It is	a contributed program that analyzes the MPE I/O configuration and lists it in parts or
	whole. It gives a nice analysis of how each controller and supervisor is used.

Use it when the configuration is not known

Find it usually in PUB.SYS

Documented with an internal help facility

TABLE

It is an unsupported program that lists terminal DITs and other tables used by MPE. It is command driven and is useful for examining DITs at a time when a terminal appears hung.

Use it when a terminal appears hung

Find it usually in PUB.SYS

Documented in TABLEDOC on some systems or ask PICS for it

Terminal Datacomm Tests

It is	a terminal resident test of the data comm board, cables, c TelCo lines. The loopback hood and connectors come wit backs are also used.	able connections, modems and h the terminal. Modem loop-
Use it when	any component of the MTS network is not functioning ot	her than the computer.
Find it	as sequences on the terminal keyboard	
Documented	in the terminal reference manual and the MTS Reference	ce Manual

Terminal Display Functions

It is	a terminal capability to display all terminal escape sequences and functions rather than perform them. It is very useful in finding improper data being sent to terminals.
Use it when	a terminal is hanging while receiving data
Find it	as a key on the terminal keyboard
Documented	in the terminal reference manual

Terminal Driver Mode

It is	a capability of 2645 and 2626 terminals to poll other multipoint terminals over a line. It can be used to eliminate the computer from the list of possible problems.
Use it when	you are trying to determine whether the problem lies in the computer or not, or you want to test the TelCo line
Find it	as sequences on the terminal keyboard
Documented	in the terminal reference manuals

Terminal Monitor Mode

It is	a method of using the terminal to display the traffic on the MTS line.	
Use it when	information is needed about what polling is being done.	
Find it	as a key on the terminal keyboard	
Documented	in the terminal reference manual and the MTS Reference Manual	

Terminal Selftest

	is	a pass/fail test of the terminal hardwar
--	----	--

Use it when a terminal is not functioning properly or other tests are to be done using a terminal

Find it as a key on the terminal keyboard

Documented in the terminal reference manuals

TIMS (HP4943,4935)

It is	a Transmission Impairment Test Set or similar device for analyzing the quality of a line or set of modems. It is a standard piece of TelCo equipment and is used by many companies with large data communications installations.	
Use it when	line quality is suspected as the cause of problems	
Find it	on the HP price list and in various catalogs	
Documented	in Telco manuals and accompanying literature	
TRACE		
It is	a process created when the $trace$ parameter is used with a communications subsystem	
Use it when	line activity is to be recorded to diagnose problems	
Find it	the Operator commands for DS, IMF, MRJE and MTS, or the RJLINE command of RJE	

Documented in Section 4 of the Communications Handbook, in the X.25 Reference Manual, and in each subsystem reference manual

Symptom	Cause	Recovery
The screen is blank and the terminal does not respond.	 The terminal is not plugged in. The terminal is not powered on. A terminal fuse has blown. The terminal is not properly reset. The terminal is malfunctioning. 	 Plug in the power cord. Turn the power switch on. Replace the fuse. Do a full reset (press the RESET key twice quickly, <u>CONTROL</u> <u>SHIFT</u> RESET or <u>CONTROL</u> <u>SHIFT</u> (BREAK) -or- Power the terminal off, then power it on again. Contact your HP Representative.
The screen may not be blank, but no cursor is visible.	 On an HP Graphics terminal, the alpha display may not be on. The microcode is being reloaded from the CPU. There is a terminal microcode error. 	 Turn the alpha display on. Wait a few seconds until it's reloaded. Do a full reset (press the RESET key twice quickly). -or- Power the terminal off, then power it on again. -or- Contact your HP Representative.
The cursor does not travel across the full width of the screen.	The margins are indented from column 1 and/or column 80.	Reset the margins. -or- Perform a full (hard) reset of the terminal (press the RESET key twice.

TABLE 5-7. PROBLEMS OPERATING PERIPHERAL DEVICES

Symptom	Cause	Recovery
When you press RETURN, the cursor or typing-head returns to the beginning of the same line but there is no response from the computer.	 The computer is down. The terminal is not in Remote Mode. The terminal is in Block Mode. 	 Contact your Console Operator. Put the terminal into Remote Mode. Press (ENTER) to trigger transmission. -or- Disable Block Mode, then press (RETURN).
	 You may have typed (CONTROL)S, sending an XOFF to the computer. The cable or phone connection between your terminal and the computer may be broken. 	 4. Type [CONTROL]Q to re-enable output from the computer. 5. Check your terminal's data cable (at the back of the terminal and at the modem or computer). -0r- Make sure your modem is still receiving a carrier signal from the remote modem (check the
	 6. The keyboard is locked. 7. Your program may not have finished processing (possibly due to a heavy system load). 8. Your program may be in an in finite loop. 9. The computer may be in an in finite loop. 	 carrier indicator light). 6. Press RESET once. 7. Wait several minutes, in case the program has not finished processing. -or- Press (BREAK); if there is a significant lag to get a colon prompt the computer is heavily loaded. Type :RESUME to continue processing, or type :ABORT to halt the program. 8. Abort the program (by pressing (BREAK) and typing :ABORT). 9. Check with the Console

TABLE 5-7. PROBLEMS OPERATING PERIPHERAL DEVICES (cont'd)

đ

4

1

1

5-44

Symptom	Cause	Recovery
When you press (RETURN), the cursor or typing head returns to the beginning of the next line, but you get no other response from the computer.	 AUTO LF is on and one of the conditions in the previous symptom (1-3), holds. Your program may be awaiting additional input. 	 Same as 1-3 in the previous symptom. Type in additional data, press <u>RETURN</u> or type in the input termination character.
When you type, noth- ing appears on the screen, and the com- puter does not respond.	 The keyboard cable is not con- nected properly to the back of your terminal. Your terminal did not reset properly. 	 Check the connection for looseness, the wrong board, or for a loose Keyboard Interface PCA. Do a full reset (press RESET twice). -or- Power the terminal off and back on again.
	 Your terminal is malfunctioning. Your modem is 	 Press TEST and examine the results (consult the manual for interpretation). -or- Have the terminal serviced. Make sure the modem is still
	malfunctioning.	receiving a carrier signal from the remote modem (check the carrier indicator light).
	5. The computer is down.	5. Check with the Console Operator.
When you type, noth- ing appears on the screen, but you get the expected response from the computer.	Character Echo is turned off.	Obtain an MPE prompt (:), then type (ESCAPE) followed by a colon (:) to turn Echo on.

TABLE 5-7. PROBLEMS OPERATING PERIPHERAL DEVICES (cont'd)

TABLE 5-7. PROBLEMS OPERATING PERIPHERAL DEVICES (cont'd)

Symptom	Cause	Recovery
The terminal ap- pears hung; you are receiving no output, and you cannot in- put data.	 The computer (terminal driver) may be in an "XON wait". Your program may not be ready to output data yet. The computer is down. 	 Type (CONTROL)Q to re-enable output to the terminal. Press (BREAK) to see if you get a colon (:) prompt. If you do, the computer is still up. Type :RESUME to continue. Check with the Console Operator.
When you press (RETURN), the cursor returns to the begin- ning of the same line and prints out data.	 AUTO LF may be enabled at the terminal. Terminal Memory Lock may have been set at the bottom line of the screen. The terminal port might be in Tape Mode (ATC only). 	 Disable AUTO LF. Turn off Memory Lock. -or- Do a full reset of the terminal (press RESET twice). Press (CONTROL)Y.
While typing, or after pressing (RETURN), "gar- bage" is printed on your screen.	 The terminal speed setting doesn't match the port speed setting. 	 Cycle through the terminal speeds trying them one at a time until you find the correct one. -or- If your port is configured for speed-sending (sub-types 0-3), log off and log on again.

Symptom	Cause	Recovery			
	2. The modem speed doesn't match port and/or terminal speed.	 If your port is configured as "speed-specified" (sub-types 4-7), make sure the modem is operating at the port's speed. If the problem persists, cycle through the terminal speeds, trying them one at a time, un- til you find the correct one. 			
	3. The terminal parity setting doesn't match what the port expects.	3. Change the terminal parity setting until you find the cor- rect one.			
		If your port is on an ATC, you may log off and log on again to "re-synchronize" the parity settings.			
		If your port is on an ATP or ADCC, your terminal was probably set for EVEN or NONE parity at logon. Change the parity and try to log on again.			
	4. The Keyboard Interface PCA may be loose if your terminal is an HP 264X.	4. Press the board into place.			
	5. The wrong character set is enabled	5. Press (CONTROL)N -or- Press (CONTROL)O -or- If you have a 262x terminal, go into the TERM CONFIG menu and make sure that the desired character sets are available.			
Type in a known MPE command, and get an Unknown Command.	 Terminal has "A" strap set. (RETURN) has been redefined. The terminal is transmitting parity and the computer (Command Interpreter) does not expect parity. 	 Disable strap A. Use the appropriate "Carriage Return" key. Disable parity on the terminal. 			

TABLE 5-7. PROBLEMS OPERATING PERIPHERAL DEVICES (cont'd)

5-47

Symptom	Cause	Recovery		
When you press (RETURN), you receive the message "I/O Error on Input".	 The computer (Command Interpreter) expects parity, but the terminal is not sending it or is sending the wrong parity. A transmission error occurred. 	 Change the parity setting. Retype the line and press (RETURN) 		
On an HP 264x ter- minal, the cursor is in the home position, the keys are inoperative, and the TEST key does not work.	Keyboard Interface PCA is loose or defective.	Press the board into the backplane or replace the board.		
Lines of typed data are duplicated ("echoed") on your terminal screen.	Your port is configured as "non- duplicative" when it should be "duplicative". (The Echo Facility would not cause this problem.)	Ask your Console Operator to check the configuration for your port. If the port is "non- duplicative", re-configure your terminal port.		

TABLE 5-7. PROBLEMS OPERATING PERIPHERAL DEVICES (cont'd)

Symptom	Cause	Recovery			
Frequently "hung" Reads.	 For reads terminating on a byte count, your data may be overrunning the port controll- er, thus causing its input byte counter to be improperly adjusted. For block mode reads, you may not have strapped the terminal correctly or enabled user handshaking. 	 See whether the control characters are embedded in the data stream. If so, disallow them. (Tell the terminal operator not to embed control characters within the data stream.) Use the Read Limit Timer with your Reads. When this timer expires, the Read is terminated by the File system. -or- Use a lower terminal speed. 			
An unending stream of program prompts are being printed at the terminal.	An end-of-file condition is en- countered at the device.	Modify the program to check the end-of-file condition before re- issuing the read.			
Pressing (RETURN) on the terminal once causes a double Return.	1. The Terminal Type is for full duplex operation and the ter- minal is set up for half-duplex (terminal echoes CR and con- troller echoes CR).	1. Disable the Echo Facility.			
	2. AUTO LF is enabled.	2. Switch the terminal to full- duplex or disable AUTO LF.			
Pressing (RETURN) while in the MPE Command Interpreter does not generate a LF, or it garbles the colon (:) prompt.	AUTO LF may be enabled. This line from the terminal is clobber- ing the CR LF:DC1 from the computer.	Disable the AUTO LF key on the terminal.			

TABLE 5-8. PROBLEMS PROGRAMMING WITH PERIPHERAL DEVICES

TABLE 5-8. PROBLEMS PROGRAMMING WITH PERIPHERAL DEVICES (cont'd)

Symptom	Cause	Recovery			
 Unexpected device behavior: Your reads are terminating earlier than what was expected. The terminal speed is different from what was expected. The behavior of Echo is opposite from what is expected. The behavior of Subsystem Break is opposite from what you expected. 	 Most FCONTROL calls affect all the files opened on a device. Perhaps your program issued an FCONTROL call against another file open on this device. If several programs (even being run by other users) are accessing this device, someone else's program might be using FCONTROL to change the device characteristics "behind your back". 	 Add one or more FCONTROL calls to your program to set up the device characteristics you need. Find out if other programs are accessing your device. Either im- plement an initialization scheme for each access period or modify all programs to use the same setting. 			
 Parity errors seem to occur on every (or nearly every) transmission. The behavior of (CONTROL) X is opposite from what you expected. Most control characters do not function as expected. 					

READER COMMENT SHEET

HP 3000 Computer Systems

FUNDAMENTAL DATA COMMUNICATIONS HANDBOOK

5957-4634 June 1984

We welcome your evaluation of this manual. Your comments and suggestions help us to improve our publications. Please explain your answers under Comments, below, and use additional pages if necessary.

Is this manual technically accurate?	Yes	No No
Are the concepts and wording easy to understand?	Yes	No No
Is the format of this manual convenient in size, arrangement, and readability?	Yes	No No
