Each product listed in Appendix A meets either FCC classification A or B. Refer to the Electromagnetic Emissions heading in the appropriate table to determine the classification of the product.

FOR U.S.A. ONLY

The Federal Communications Commission (in 47 CFR 15.838) has specified that the following notice be brought to the attention of the users of this product.

FEDERAL COMMUNICATIONS COMMISSION RADIO FREQUENCY INTERFERENCE STATEMENT

Warning: This equipment generates and uses radio frequency energy and if not installed and used properly, that is, in strict accordance with the manufacturer's instructions, may cause interference to radio and television reception. It has been type tested and found to comply with the limits for a Class B computing disc/tape drive in accordance with the specifications in Subpart J of FCC Rules, which are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures: reorient the receiving antenna; relocate the equipment with respect to the receiver; move the equipment away from the receiver; plug the equipment into a different branch circuit. If necessary, the user should consult the dealer or authorized field service representative for additional suggestions. The user may find the following booklet prepared by the Federal Communications Commission helpful: "How to Identify and Resolve Radio-TV Interference Problems". This booklet is available from the U.S. Government Printing Office, Washington, DC 20402. Stock No. 004-000-00345-4.

FEDERAL COMMUNICATIONS COMMISSION RADIO FREQUENCY INTERFERENCE STATEMENT

Warning: This equipment generates, uses, and can radiate radio frequency energy and if not installed and used in accordance with the instructions manual, may cause interference to radio communications. It has been tested and found to comply with the limits for Class A computing devices pursuant to Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area is likely to cause interference in which case the user at his own expense will be required to take whatever measures may be required to correct the interference.

INTRODUCTION

SECTION

Ī

GENERAL INFORMATION

This manual provides information regarding the environmental requirements of Hewlett-Packard disc/tape drives. These include operating and nonoperating (storage, transport or power down) requirements as well as recommended limits. Section II provides a generic description of each environmental item and Section III provides general information on site planning. Appendices A and B contain the specific environmental requirements, operational specifications and operational characteristics for each specific HP disc/tape drive.

Note: This manual applies only to HP disc/tape drives listed in Appendices A and B.

The environmental requirements cover both the actual physical location of the disc/tape drive and the associated area. While Hewlett-Packard provides consultation on the site environmental requirements, the scheduling, planning, preparation and verification of a site environment suitable for installation of a Hewlett-Packard disc/tape drive is the customer's responsibility. Hewlett-Packard Sales and Support Personnel are available during the pre-installation period to assist the customer.

The information in this manual covers only Hewlett-Packard disc/tape drives and accessories. The customer is responsible for meeting the site environmental requirements for the rest of the system components. If the disc/tape drive is to be installed on Hewlett-Packard computer equipment, appropriate site preparation documentation, including environmental requirements, will be provided for each system component.

Environmental requirements are those items required to ensure that HP disc/tape drives meet the published operational characteristics. Each environmental item has a specific measurable parameter or information that affects the operational characteristics of a HP disc/tape drive. Continual operation of the disc/tape drive outside the limits of the recommended environmental limits may result in degradation of disc/tape drive operation. The following items are considered environmental requirements:

· Temperature

• Electromagnetic Susceptibility

Humidity

• Power

Shock

Contaminants

Vibration

· Cooling Requirements

• Altitude

• Tilting

Contaminants (page 2-6) as yet have no measurable parameters except as rated for the disc/tape drive particulate filter. Chemical contaminants that can corrode disc/tape drive components are presently being researched by Hewlett-Packard. Operating a Hewlett-Packard disc/tape drive in an environment known to contain significant amounts of the listed contaminants will lead to disc/tape drive malfunctions requiring extensive-servicing. Hewlett-Packard therefore recommends to our customers that HP disc/tape drives not be stored or operated in areas that contain the contaminants listed in Section 2 under corrosive contaminants.

Introduction

CUSTOMER RESPONSIBILITY

The customer is responsible for furnishing all labor and materials for site preparation, site maintenance, conformance to local codes, and the compatibility of Hewlett-Packard products with local laws, codes and licenses. The customer is solely responsible for establishing and maintaining the site requirements specified at the site planning meeting. Failures resulting from such unspecified environmental or physical phenomena are not covered by warranty or maintenance agreement (examples include, but are not limited to, unusual shock or electrical damage, accident, fire or water damage, neglect, air conditioning failure, humidity control failure, damages during transportation by customer or causes other than ordinary use, or toxic or corrosive chemicals present in the air).

CUSTOMER ENGINEERING SERVICES

HP offers complete on-site customer engineering maintenance service on a world-wide basis. Charges for this service, quoted as a basic monthly maintenance charge (BMMC), are among the lowest in the industry, contributing to the low overall cost of ownership associated with the purchase of an HP disc/tape drive.

Provisions of the BMMC require compliance with the specifications and/or recommendations listed in this site environmental requirements manual unless escalation procedures are implemented. Conditions that are identified as having a detrimental effect on disc/tape drive performance (e.g., corrosive gases, noisy or unstable power source, etc.) must be corrected prior to installation.

For further details, contact your nearest Hewlett-Packard Sales and Support Office.

ENVIRONMENTAL REQUIREMENTS

SECTION

П

INTRODUCTION

The quality and reliability features of a product must be developed early in the product design stage and carried through the manufacturing process. Hewlett-Packard seeks to design and build the finest quality and reliability into our products starting at the bread-board design stage.

Type testing is where a group of units are tested and the results of that testing is used to represent that particular product.

Due to the length of testing time, and in some cases the increased stress levels applied to the product, it is not practical to test each and every product manufactured to every environmental specification. However, certain tests are performed on each product as it completes the manufacturing cycle. This testing ensures that the product sold is as good as the product that was environmentally tested.

EFFECTS OF CLIMATE

All HP Disc/Tape Drives can operate in an environment suitable for human occupancy as long as moisture will not condense within the environment and room air does not contain chemical contaminants which may degrade disc/tape drive components. Along with the environment in which the disc/tape drive operates, the effects of outside temperature, humidity, altitude and other regional characteristics must be taken into consideration. For instance:

- At higher altitudes, the efficiency of a cooling fan decreases because of reduced air density. Consider keeping the disc/tape drive enclosure at a lower temperature to compensate for the reduced air density at the disc/tape drive air intake vents.
- In locations where extremes of temperature and humidity prevail, consider the effects of such conditions on the disc/tape drive when the main power is shut down. For instance, in northern regions, the effects of winter nighttime temperatures should be considered when the main power is shut off.
- In warm, humid regions, a fungus growth prevention program should be considered.
- In shoreline installations, the disc/tape drive site may require special air conditioners, dehumidifiers, and other items to reduce high humidity and corrosive salt in the air.

Reliability and performance are at maximum when operated within the recommended temperature and humidity range. See recommended temperature and relative humidity limits in Appendix A.

VIBRATION AND SHOCK

Vibration can cause slow degradation of mechanical parts and, when severe, can cause data errors in disc/tape drives; hence it should be avoided or controlled. Also, mechanical connections such as PCA connectors and cable connectors may be affected. The best preventive measure is to build the site away from vibration-generating sources, such as heavy industrial machinery (stamp mills, etc.). Care in handling the disc/tape drives will also avoid problems resulting from sudden shock. See vibration and shock requirements in Appendix A.

Random vibration is superior as a test technique in that all product resonances can be excited simultaneously. This is especially necessary with products whose performance characteristics are statistical in nature and can only be measured over a period of time, such as disc and tape drives. It is impractical to do a long duration single frequency test at every frequency. In addition, a sweep through the frequency range does not give adequate statistics for problem frequencies. Only random vibration offers both thoroughness and timeliness

Some environments contain vibration at discrete frequencies whereas other environments contain broadband vibrations. Random vibration test and measurement techniques work for both environments. A frequency spectrum reveals the nature and magnitude of the vibration environment and can be compared directly to the spectra in this specification.

Random vibration testing has been used extensively in military and aerospace applications but does not have widespread use in commercial markets due to the high cost of test equipment. In our continuing effort to build quality products, the cost alone cannot justify a compromised test program. Because it is relatively new in this market, some explanation of terms and concepts is appropriate.

Random vibration is vibration whose magnitude is not specified for any given instant of time. The instantaneous magnitude of a random vibration is specified only by probability distribution functions giving probable fraction of the total time that the magnitude lies within a specified frequency range. Random vibration contains no periodic nor quasi-periodic constituents.

The magnitude of this distribution is measured in power spectral density, or PSD, which is the limiting mean square acceleration per unit bandwidth. It is measured in g²/Hz and reveals how much energy is applied at a particular frequency.

A site can be qualified by comparing a frequency spectrum of the intended environment to the product specification spectra. The environment should be under the specification at every frequency. Exceptions will be evaluated on a case-by-case basis.

Figures 2-1 through 2-4 are the unpackaged operating and nonoperating vibration profiles used to test most HP disc/tape drives. The vibration test verifies the disc/tape drive's operational and mechanical integrity. Appendix A refers to the appropriate figure where applicable.

Figure 2-5 is the unpackaged operating and nonoperating shock profile used to test most HP disc/tape drives. The shock test also verifies the disc/tape drive operational and mechanical integrity. Appendix A indicates the maximum acceleration levels at which no data loss will occur and no operator intervention will be required.

ALTITUDE

Altitude must be considered for operating conditions. In the operating environment, the lower air density at extremely high altitudes may be insufficient to provide adequate cooling to the disc drive which may decrease performance and/or reliability. See altitude requirements in Appendix A.

ELECTROMAGNETIC SUSCEPTIBILITY

INTRODUCTION

Every reasonable attempt is made to make Hewlett-Packard products resistant to electromagnetic interference (EMI). However, in order to minimize the possibility of experiencing difficulty it may be necessary to take unique steps. This may include but not be limited to the following:

- Improved grounding techniques.
- Placing the disc/tape drive in a grounded screen enclosure.
- Placing grounded copper screens on all windows.

RADIATED INTERFERENCE SUSCEPTIBILITY

Electronic equipment, including disc/tape drives, may exhibit unacceptable behavior if operation is attempted in environments where electromagnetic fields exist, such as near radio and TV transmitting towers, or near radar installations as found at airports. If radiated electromagnetic fields are suspected, or verified (such as by direct measurement using spectrum analyzers or field strength meters), precautions should be taken to shield the disc/tape drive products from the electromagnetic field.

CONDUCTED INTERFERENCE SUSCEPTIBILITY

Radio frequency noise may be introduced into a disc/tape drive through the ac power line as well as through the air as an electric field. Power line conditioners and line filters are very effective in eliminating conducted radio frequency interference (RFI).

ELECTROSTATIC DISCHARGE

Electrostatic discharge, commonly known as static electricity, may cause alteration of data, improper operation or electronic failure. Carpeting, low humidity, and leather-soled shoes may all contribute to unacceptable electrostatic fields. If static discharges are detected (as when touching door knobs, or metallic objects), humidifiers, antistatic mats and other antistatic procedures should be implemented.

MAGNETIC SUSCEPTIBILITY

Disc/tape drives, and magnetic media (tapes, floppy discs and removable disc packs), may all exhibit destruction of stored data if exposed to magnetic fields. Keep all magnetic materials away from magnetic media and recording devices.

POWER LINE IRREGULARITIES

In some geographic areas, available power that is used for the disc/tape drive may experience excessive voltage sags, surges, transients, outages, or other irregularities that are unacceptable for reliable disc/tape drive operation. Therefore, a power quality survey must be conducted. The results of the survey should be analyzed for correct voltage, current, phase, the absence of detrimental power line transients, and conducted interference that can cause a malfunction to occur as a disc/tape drive out-of-specification operation. If any item does not meet HP disc/tape drive requirements, corrective action must be taken to correct the situation. Power line irregularities may be divided into the following categories:

- a. Line Dropout. The power distribution network may lose power for short periods of time. HP disc/tape drives recover gracefully from short duration line dropouts. To insure that long duration power line dropout will not affect the constant operation of any electrical device, an uninterruptible power supply (UPS) would be required. Line conditioners and regulators will not help in this situation.
- b. Over or Under Voltage. Fluctuations from the nominal line voltage are experienced as the result of equipment being turned on or off both within the immediate vicinity and also over the entire power distribution network. A power failure many miles away may cause voltage fluctuations. In a worst case situation, (e. g. brown out), a UPS is one example of a device that can provide uninterrupted power.
- c. Line Transients. Just as radio frequency noise may be transmitted over the ac power line, electrical noise may also be evidenced at the ac power outlet. Line transients may result in interrupted operation, blown fuses, or electrical failure. The surge waveforms used to test HP disc/tape drive power line transient response are shown in figure 2-6. The waveforms are described in the IEEE "Guide on Surge Voltages in AC Circuits up to 600V, Final Draft."
- d. Neutral to Ground Noise. This is the noise exhibited between the neutral and ground lines.
- e. Ground to Ground Noise. This is the noise exhibited between the disc/tape drive ground and ground earth.

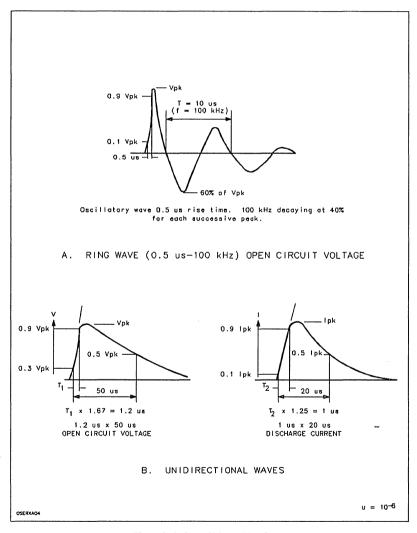

Figure 2-6. Surge Voltage Waveforms

f. Power Line Distortion. This is an undesired change in the original signal waveform that results in an unfaithful representation of the desired waveform. Waveform clipping is one example of this type of distortion. Noise in the form of extraneous signals superimposed on the desired waveform is not defined as distortion.

Power line conditioners may be helpful in regulating and conditioning (removing transients) ac power. Problems associated with power line irregularities are often very difficult to diagnose due to the unpredictable and intermittent nature of the problem.

CONTAMINANTS

Contaminants consist primarily of particulates or corrosives. Both may be airborne in atmospheric dust as a complex mixture of smokes, mists, fumes, dry granular particles, and fibers. The components of any mixture may consist of soot and smoke, silica, clay, organic materials, and metallic fragments. A sample may also include living organisms such as mold spores and bacteria. These components vary with locality, season of the year, direction and strength of the wind, and proximity of dust sources. Size of the particles also varies with differing conditions. Figure 2-7 shows size ranges of typically encountered airborne particles and figure 2-8 shows the relationship between some particles and the gap between the flying heads and oxide coating in a disc/tape drive. Avoid operation in particularly dusty areas, e.g., factory floors, sawmills, etc.

PARTICULATE CONTAMINANTS

Particulate contaminants consist primarily of dust particles which are of various physical compositions. These particles present a clear abrasive hazard to a disc/tape drive if introduced into the operating environment. In some instances, the particles are conductive and can short-circuit wiring in the disc/tape drives when an excessive amount accumulates. Also, film-forming particles and residues cause connector problems.

In environments that contain hydrocarbons, particulate accumulation on the printed circuit assemblies (PCA's) causes an increase in the internal disc/tape drive temperature. Continual accumulations of particulates eventually prevent the disc/tape drive from maintaining the correct amount of cooling on the PCA's. This causes the disc/tape drive to operate beyond the specified temperature range and a malfunction may occur as an out-of-specification operation.

The particulate upper limit is expressed as the arithmetic mean value in micrograms per cubic metre (llg/m^3) or micrograms per square centimetre per 30 days ($llg/cm^2/30$ days). If particulate limits are not available for a product, the limits will not be listed in the table for that product. Operating an HP disc/tape drive at the upper limit may require an increase in the number of times the absolute filter must be changed resulting in an increased basic monthly maintenance charge (BMMC).

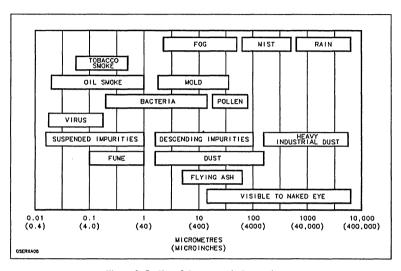

Figure 2-7. Size of Common Air Contaminants

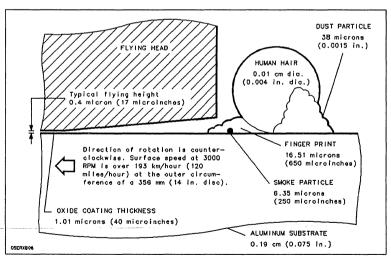

Figure 2-8. Contaminant Sizes Relative to Disc/Head Spacing

CORROSIVE CONTAMINANTS

Corrosion is a complex form of material deterioration and is generally defined as the destruction of material by chemical or electrochemical reaction with its environment. Some effects of corrosion in disc/tape drives are the destruction of magnetic surfaces on discs and tapes, deterioration of plastics used in the equipment, and general degradation of conformal coatings on printed circuit assemblies (PCA's). Many common problems can be avoided by isolating the disc/tape drive from contaminant producing machinery. Examples of this type are office copiers, milling machines, and equipment that produce corrosive vapors or particulates. However, in areas where the atmosphere contains large amount of various corrosive contaminants, more drastic measures must be taken to ensure clean air in the environment where the disc/tape drive is used. Most environments are corrosive to some degree. Examples are air and moisture; fresh, distilled, or salt water; urban and industrial atmospheres; steam and other gases such as chlorine, ammonia, hydrogen sulfide, sulfur dioxide, and fuel gases; mineral acids such as hydrochloric, sulfuric, and nitric. In general, inorganic materials are more corrosive than organic. For example, corrosion in the petroleum industry is due more to sodium chloride, sulfur, hydrochloric and sulfuric acids, and water than to oil, naphtha, or gasoline.

Corrosive environments such as that found in steel, acid, and paper manufacturing industries usually preclude the use of filtered ambient air for forced convection cooling. Corrosives generally cannot be filtered out by normal filtration methods, and the techniques that must be used are complex and costly. In these cases, the disc/tape drives must be enclosed in a highly controlled environment.

Although the term "environment" as used here refers only to atmospheric contaminants, there is a strong link between corrosion rates and temperature and humidity conditions. Many corrosion processes (film thickness buildup, etc.) accelerate rapidly at high humidities and temperatures. This means that corrosive environments that possess high temperatures and humidities should be of particular concern. The following are typical corrosive contaminants.

- Sulfur Dioxide. Sulfur dioxide is generally considered the most corrosive of the common contaminant
 gases. In combination with water, it forms sulfurous acid mist, an active and rapidly corrosive compound.
 It is known to produce molecular separation in polymers, and to cause spots on microfilm materials. This
 acid is found in industrial environments and causes deterioration of disc surfaces.
- Total Oxidants. The presence of strong oxidizing gases in the atmosphere, particularly ozone, is known to be potentially harmful to any organic material. The damaging effects most often encountered are the cross linking of elastomers, the cracking of stressed rubber, and the oxidation of silver.
- Hydrogen Sulfide. Hydrogen sulfide is a rapid corrosive agent, particularly to copper and silver. Hydrogen
 sulfide is a common atmospheric contaminant found near oil fields, sulfur springs, and marshy areas, and
 occasionally is emitted from industrial or sewage treatment activities.
- Ammonia. In sufficient concentrations, ammonia has been found to cause cracking of stressed brass, decrease insulation resistance, and increase loss factor in certain insulators.
- Halogens. Halogens are chemical elements that are fairly corrosive. The halogens are: fluorine, bromine, chlorine, and iodine. Halogens react strongly with metals and hydrogen to form halides. The metal halides are solid water-soluble salts such as table salt (sodium chloride). Halogens usually occur in salt deposits and sea water environments. Halogens (and their compounds) are widely used in medicine, photographic films, sanitation processes, disinfectants, insecticides, some textile processes, paints, bleaches and plastics.

COOLING REQUIREMENTS

A fan, internal to the disc/tape drive, provides adequate ventilation when the disc/tape drive is operated in the appropriate environment. To obtain maximum efficiency, allow the required clearances between the front and rear of the disc/tape drive. Air conditioning may be required to maintain the correct temperature. Install required air conditioning before installation of a HP disc/tape drive. See temperature and cooling requirements in Appendix A.

TILTING

Tilting the disc/tape drive more than the specified angle may result in longer seek times or no seek at all. These seek times may be greater than the specified seek time. See tilting requirements in Appendix A.

2-11/2-12

SITE PLANNING

SECTION

Ш

3-1. INTRODUCTION

The purpose of site planning is to provide an optimum environment for computer products. By providing this optimum environment the customer will receive maximum satisfaction and success. As stated in the specification tables (refer to Appendix A), continually operating a product at an extreme of the environmental requirements can reduce the product reliability.

Since Hewlett-Packard is dedicated to customer satisfaction we have provided a set of recommended environmental specification for a majority of the products listed in Appendix A. By providing an environment that fits within the range of the recommended environmental specifications, the customer should receive maximum long term trouble free operation of their HP products.

3-2. ENVIRONMENTAL SPECIFICATIONS

Three different specifications are given for most environmental requirements.

- Recommended Specifications
- Operating Specifications
- Nonoperating Specifications

Recommended specifications are those specifications that Hewlett-Packard, through experience has determined will provide the maximum long-term success to our customers.

For those products in Appendix A that do not have a recommended specification for one of the environmental specifications it is recommended to the customers that they provide an environment that fits into the mid range of the operating specifications, where practical.

Operating specifications are those specifications that Hewlett-Packard, through type testing, has determined provides a safe (survival) operating range for the product. It also must be understood that continual operation at the extremes of this operating range results in stress on the the product and can result in early failure or less reliable operation. All possible combinations of stresses have not been type tested. The results of simutaneously applying worst case extremes of several environmental parameters are unpredictable.

Nonoperating specifications are designated limits for transit and storage of the product. Type testing has been completed to ensure that the HP product will operate when installed, if these nonoperating specifications have not been exceeded.

-3-3. ENVIRONMENTS

There are basically two environments where Hewlett-Packard disc and disc/tape drives should be operated. The first is the controlled computer room environment. This environment is a physical area where all environmental elements (i. e. temperature, humidity, power, etc.) are controlled to fit the recommended specifications of the disc drives 100 percent of the time. Disc drives such as the HP 792X, HP 7933 and HP

Site Planning

7935 should be operated in this type of environment. These disc drives are typically connected to large computer systems that require this environmental control for maximum reliability. Under certain circumstances certain members of the HP 791X family fit into this category.

The second environment can be defined as the general office environment where personnel work on a full time basis and where environmental elements are subject to greater variations (within the recommended ranges) than those in a controlled computer room. Although they have the same recommended specifications as the HP 793X, members of the HP 791X and HP 794X series are typically operated in the environment with the following recommendations. It is recommended that the customer make every effort to reduce all adverse affects on the disc drive. This should include, but not be limited to, clean power, reduced temperature and humidity swings and reducing the circumstances where electrostatic discharge can cause reliability problems.

While many Hewlett-Packard disc drives have been operated successfully in environmental circumstances not optimally suited for reliable operations, there have also been circumstances where reliability has been adversely effected.

It is Hewlett-Packard's goal that our customers be highly successful in the use of our products. We therefore highly recommend that the time, energy and effort be made to provide a benign environment for our products. It will be to the long term benefit of our customers.

3-4. ACOUSTICS

There are two methods of specifying acoustic emissions: sound pressure level and sound power level. Sound pressure level is most commonly quoted because it yields a number significantly lower than sound power level. The disadvantage in comparing sound pressure levels is that the values are dependent upon test methods and measurement distances. For example, if sound pressure is measured from a long distance, the result is a very low number, although the product may be producing a lot of noise.

Sound power levels take measurement distance and method into account and yield the actual noise level emitted by the product. Sound pressure levels result from measuring only what reaches the sound meter. The only number valid to use for product comparisons is sound power level.

Where applicable, both numbers are quoted in the specification tables (Appendix A) to indicate the difference between the two numbers. Sound pressure numbers quoted are an average of nine points that lie on a parallelepiped whose surfaces are one metre from every product boundary.

APPENDIX A HEWLETT-PACKARD DISC/TAPE DRIVE SPECIFICATIONS

PRODUCT SPECIFICATIONS AND CHARACTERISTICS

NOTE

The following information stipulates the operating specifications and characteristics of this device/subsystem when installed and operated within the limits specified under ENVIRONMENTAL REQUIREMENTS found elsewhere in this table.

Operating Specifications

DISC DRIVE OPERATING SPECIFICATIONS

Average controller overhead time:	4.0 ms
Average seek time:	30.0 ms
Average rotational delay:	8.5 ms
Average time to transfer 1 kbyte (at 625 kbytes/sec):	_1.8 ms
Total average transaction time (excluding system overhead):	44.3 ms

Disc performance index:

22.6*

DISC DRIVE DATA CAPACITY (formatted)

Item	Data Bits	Data Bytes	Sectors	Tracks	Heads
	Per	Per	Per	Per	Per
Byte Sector Track Head Removable Total	8 2048 131,072 82,182,144 164,364,288 328,728,576	256 16,384 10,272,768 20,545,536 41,091,072	64 40,128 80,256 160,512	627 1254 2508	2 14

^{*}Maximum disc transactions per second, for 1 kbyte transfers, less system overhead. (Refers to fundamental disc performance; true 1/O rates are application dependent and must take into account system overhead, including the individual system configuration specifications.)

POWER CHARACTERISTICS

Voltages (true RMS): 115V setting;

100V, 115V, 120V, single phase (inclusive tolerance range is 90V to 132V)

230V setting:

230V, 240V, single phase (inclusive tolerance range is 180V to 264V)

Frequency:

47.5 to 66 Hz

Maximum Power (during spin up):

115V setting; 200 Watts (90V, 60Hz) 230V setting; 200 Watts (180V, 60Hz)

Typical Power:

 115V setting;
 145 Watts (115V, 60Hz)

 230V setting;
 145 Watts (230V, 50Hz)

Maximum Current (occurs during spin-up):

115V setting; 3.0A (true RMS at 90V, 60Hz)
230V setting; 1.7A (true RMS at 180V, 50Hz)

Typical Current:

 115V setting;
 1.7A (true RMS at 115V, 60Hz)

 230V setting;
 1.0A (true RMS at 230V, 50Hz)

Table A-1. HP 7907A Disc Drive Specifications (cont.)

Line Dropout:

No effect on performance; no operator intervention required for dropout equal to or less than 1/2 cycle(s) of the ac line frequency (20 ms, 50 Hz; 16.7 ms, 60 Hz).

HEAT DISSIPATION

Maximum (during spin up): Typical: 200 Watts (683 Btu/hr; 172 Kcals/hr) 145 Watts (495 Btu/hr; 125 Kcals/hr)

ACOUSTIC EMISSIONS

Average sound pressure level $(\overline{L_p}_A)$: Sound power level (L_{wA}) :

54 dB(A) 67 dB(A)

ELECTROMAGNETIC EMISSIONS

Radiated and conducted interference:

- HP 7907 -- For U.S.A., meets FCC docket 20780 for Class A computing peripheral devices.
- HP 7907 -- for Europe, meets VDE 0871 for Level B computing devices. FTZ licensed on some HP systems. Refer to your local sales representative for more information.

Magnetic operating: Magnetic nonoperating: <5 gauss on all surfaces</p><5.25 milligauss at 4.6m (15 ft) on all surfaces</p>

SAFETY

- CSA certified to CSA 22.2 No. 154.
- Meets all applicable safety standards of IEC 380 and IEC 435.
- UL listed to UL 114 and UL 478.

TILT

When mounted using an HP 19507A Rackmount Kit, the HP 7907 shall meet all performance specifications throughout a 360° rotation. Shock and vibration testing has not been performed on the HP 7907 while being tilted.

ENVIRONMENTAL REQUIREMENTS

Note: The environmental specifications listed herein apply when this device is not connected to a Hewlett-Packard (HP) system. When this device is connected with HP systems, the more stringent environmental and performance specifications listed for any single HP device within the HP system are applicable and supersede these specifications.

The following specifications were type-tested under controlled conditions. Hewlett-Packard maintains an active program of auditing production products to ensure these specifications remain true when products are again tested under the same conditions. The limits of these specifications do not represent optimum for long, trouble-free operation and are specifically not recommended for maximum customer satisification. The recommended conditions are stated separately where appropriate.

POWER REQUIREMENTS

Voltages (true RMS):

115V setting;

100V, 115V, 120V, single phase (inclusive tolerance range is 90V to 132V)

230V setting;

230V, 240V, single phase (inclusive tolerance range is 180V to 264V)

Frequency:

47.5 to 66 Hz

Maximum Power:

115V setting (during spin up); 230V setting;

270 Voltamps (90V, 60Hz) 306 Voltamps (230V, 50Hz)

Typical Power:

115V setting; 230V setting; 195 Voltamps (90V, 60Hz) 230 Voltamps (230V, 50Hz)

Maximum Current (occurs during spin-up):

115V setting; 230V setting; 3.0A (true RMS at 90V, 60Hz) 1.7A (true RMS at 180V, 50Hz)

Typical Current:

115V setting; 230V setting; 1.7A (true RMS at 115V, 60Hz) 1.0A (true RMS at 230V, 50Hz)

Line Surge and Sag:

80% and 120% typical line voltage for 30 sec. 70% and 130% typical line voltage for 0.5 sec.

Line Dropout:

Must not exceed 1/2 cycle, 10 ms at 50 Hz or 1/2 cycle 8.3 ms at 60 Hz.

Table A-1. HP 7907A Disc Drive Specifications (cont.)

TEMPERATURE

Recommended operating range:

Operating range:

Nonoperating range:

20°C to 25.5°C (68°F to 78°F) 10°C to 40°C (50°F to 104°F) -40°C to 75°C (-40°F to 167°F)

Maximum rate of change:

20°C (36°F) per hour

HUMIDITY

Operating:

5% to 95% relative humidity, noncondensing

Nonoperating:

5% to 95% relative humidity, noncondensing

VIBRATION*

Operating

(See Figure

2 - 3) Nonoperating

<500V <10 kV

Unidirectional wave (one 20 us wide pulse): Recommended limit:

<500V

POWER REQUIREMENTS

Recommended limit:

The daily average not to vary more than ±2% from the correct voltage

Voltage: Frequency: 100, 120, 220, 240V; +5%,-10% 50 Hz, 60 Hz; +10%, -5%*

Recommended frequency:

47.5 to 52.5 Hz, 57 to 66 Hz

Phase: Current:

Single 8 amperes maximum at 120 Vac, 60 Hz

Distortion:

5% peak and flat harmonic distortion

Line Surge and Sag:

80% and 120% typical line voltage for 30 sec.

70% and 130% typical line voltage for 0.5 sec.

*The HP 7911/HP 7912/HP 7914 Disc/Tape Drives require a pulley and belt change when changing between 50 Hz and 60 Hz.

Table A-2. HP 7911, 7912 and 7914 Disc/Tape Drives Specifications (continued)

TILT

Can be operated in any position; however, the disc drive drive should not be rotated about its axis (vertical axis for the HP 7914P; horizontal axis for the HP 7914R) at a rate greater than 0.2 radians/second due to gyroscopic effects. Rotation beyond this rate can cause errors which require reinitialization of the media.

COOLING REQUIREMENTS

Allow 76.2 mm (3 in.) in front and behind for adequate air flow.

SYSTEM CONFIGURATIONS **

- Total cable length is limited to one metre per equivalent HP-IB load.
- Each HP 7911, HP 7912, or HP 7914 places one equivalent load on each of the HP-IB lines.
- In addition to the external HP-IB cable provided, each HP 7911, HP 7912, and HP 7914 has an internal 1-metre HP-IB cable that must be considered when configuring the disc drive with a system.

^{**}Consult the appropriate system configuration guide for specific constraints in conjunction with the host CPU.

76 dB(A)

SAFETY

- CSA certified to CSA 22.2 No. 154.
- Meets all applicable safety standards of IEC 380 and IEC 435.
- UL listed to UL 114 and UL 478.

ENVIRONMENTAL REQUIREMENTS

Note: The environmental specifications listed herein apply when this device is not connected to a Hewlett-Packard (HP) system. When this device is connected with HP systems, the more stringent environmental and performance specifications listed for any single HP device within the HP system are applicable and supersede these specifications.

The following specifications were type-tested under controlled conditions. Hewlett-Packard maintains an active program of auditing production products to ensure these specifications remain true when products are again tested under the same conditions. The limits of these specifications do not represent the optimum for long, trouble-free operation and are specifically not recommended for maximum customer satisification. The recommended conditions are stated separately where appropriate.

TEMPERATURE

Recommended operating range: Operating range:

Nonoperating range: Maximum rate of change: 20°C to 25.5°C (68°F to 78°F) 10°C to 40°C (50°F to 104°F) -40°C to 60°C (-40°F to 140°F) 10°C (18°F) per hour

HUMIDITY

Operating:

20% to 80% relative humidity, noncondensing and with maximum of 0.015kg water per kg of dry air. For example, this is equivalent to a maximum of 80% relative humidity at 24° C (75°F), a maximum of 50% relative humidity at 32° (90°F), or a maximum of 32% relative humidity at 40° C (104° F).

Table A-4. HP 7914TD Disc/Tape Subsystem Specifications (cont.)

Nonoperating:	10% to 90% relative humidity, noncondensing and wet bulb temperature not to exceed 25.6 °C (78°F). For example, this is equivalent to a maximum of 90% relative humidity at 27°C (81°F), a maximum of 50% relative humidity at 34° (93°F), or a maximum of 32% relative humidity at 40°C (104°F).

TILT

The tape drive has not been tested for tilt. The disc drive can be operated in any position; however, the disc drive should not be rotated about the horizontal axis perpendicular to its side at a rate greater than 0.2 radians/second due to gyroscopic effects. Rotation beyond this rate can cause errors which require reinitialization of the media.

TILT

This product can be operated in any position; however, the disc drive should not be rotated about its vertical axis at a rate greater than 0.2 radians/second due to gyroscopic effects. Rotation beyond this rate can cause errors which require reinitialization of the media.

COOLING REQUIREMENTS

Allow 76.2 mm (3 in.) in front and behind for adequate air flow.

*The HP 7914CT Disc/Tape Drive require a pulley and belt change when changing between 50 Hz and 60 Hz.

Table A-5. HP 7914CT Disc/Tape Drive Specifications (continued)

SYSTEM CONFIGURATIONS **
• Total cable length is limited to one metre per equivalent HP-IB load.
• In addition to the external HP-IB cable provided, each HP 7914CT has an internal 1-metre HP-IB cable that must be considered when configuring the disc drive with a system.
• In an HP 7914CT, each controller places one equivalent load on the HP-IB lines.
t*Consult the appropriate system configuration guide for specific constraints in conjunction with the host CPU.
Hewlett-Packard, in a continuing effort to offer excellent products at a fair value, reserves the right to change specifications, designs and models without actice.

Controller cache impact:	-16.6 ms*	0.0 ms*
Total average transaction time (excluding system overhead):	24.0 ms	39.6 ms

Disc performance index:

41.7 ms** 25.3 ms**

*** ****** /

*The reduction in time is due to the reduced number of seeks required for a disc drive with controller cache. The actual performance improvement on a disc drive will vary, depending on the read hit rate and the read precentage; the listed values are based on a read hit rate of 70% and a read precentage of 70%.

Hit rate is defined as the number of times the disc drive finds information in cache divided by the number of times the information is requested from the disc drive.

**Average disc transactions per second. Refers to fundamental disc drive performance; actual I/O rates are application dependent and must take into account system overhead, the system configuration, and the locality of data on the disc. The read hit rate and the read precentage will also have a significant impact on performance of the HP 793XP Disc Drive.

SYSTEM CONFIGURATIONS*

- Total cable length is limited to 1 metre per equivalent HP-IB load.
- This disc drive places one equivalent load on each of the HP-IB lines.

*Consult the appropriate system configuration guide for specific constraints in conjunction with the host CPU.

Figure A-2. HP 793X Standard and Optional Power Cords (continued)

ENVIRONMENTAL REQUIREMENTS

Note: The environmental specifications listed herein apply when this device is not connected to a Hewlett-Packard (HP) system. When this device is connected with HP systems, the more stringent environmental and performance specifications listed for any single HP device within the HP system are applicable and supersede these specifications.

The following specifications were type-tested under controlled conditions. Hewlett-Packard maintains an active program of auditing production products to ensure these specifications remain true when products are again tested under the same conditions. The limits of these specifications do not represent the optimum for long, trouble-free operation and are specifically not recommended for maximum customer satisfication. The recommended conditions are stated separately where appropriate.

AMBIENT TEMPERATURE

Recommended operating range:

Operating range: Nonoperating range:

Maximum rate of change:

20°C to 25.5°C (68°F to 78°F) 10°C to 40°C (50°F to 104°F) -40°C to 65°C (-40°F to 149°F) 20°C (36°F) per hour

HUMIDITY

Operating:

8% to 80% relative humidity, noncondensing and wet bulb temperature not to exceed 25.6 °C (78 °F). For example, this is equivalent to a maximum of 80% relative humidity at 28°C (82°F), a maximum of 50% relative humidity at 34° (93°F), or a maximum of 32% relative humidity at 40°C (104°F).

Nonoperating:

8% to 80% relative humidity, noncondensing and wet bulb temperature not to exceed 25.6 °C (78 °F). For example, this is equivalent to a maximum of 80% relative humidity at 28°C (82°F), a maximum of 32% relative humidity at 40° (140°F) or, a maximum of 15% relative humidity at 50°C (122°F).

Note: The media module must not be installed if there are signs of moisture condensation in or on the media module.

ALTITUDE

Operating: Nonoperating:

maximum 3 000m (9,840 ft) maximum 15 000m (49,213 ft)

Table A-7. HP 97935A Media Module Specifications

VIBRATION

Operating (See Figure 2-1)

Random vibration with maximum power spectral density (PSD) of 2.5 X 10^{-5} g²/Hz from 5 to 10 Hz; 7.5 dB/octave from 10 to 2.5 Hz; PSD of 2.5 X 10^{-6} g²/Hz from 2.5 to 30 hz; -24 dB/octave from 30 to 40 Hz; PSD of 2.5 X 10^{-5} g²/Hz from 40 to 2000 Hz; -9.3 dB/octave from 2000 to 2500 Hz; PSD of 1.25 x 10^{-5} g²/Hz at 2500 Hz.

Nonoperating (See Figure 2-2)

Random vibration with a power spectral density of 0.0005 g²/Hz from 10 to 2000 Hz.

SHOCK*

Operating: Nonoperating: 2 g maximum at 11 ms, half sine waveform 30 g maximum at 11 ms, half sine waveform

* The effect of excessive shock on a media module will be, in decreasing order of severity, head crash, premature failure of spindle and actuator, or error rate.

OPERATING SPECIFICATIONS

Average controller overhead time:	10.1 ms
Average seek time:	30 ms
Average rotational delay:	8.3 ms
Average time to transfer 1 kbyte (at 625 kbytes/sec):	2 ms
Total average transaction time (excluding system overhead):	50.4 ms

Disc performance index:

20*

Refers to fundamental disc performance; true I/O rates are application dependent and must take into account system overhead, including the individual system configuration specifications.

OPERATING CHARACTERISTICS

HEAT DISSIPATION

Maximum: Typical: 85 Watts (290 Btu/hr; 73 Kcals/hr) 65 Watts (222 Btu/hr; 56 Kcals/hr)

ELECTROMAGNETIC EMISSIONS

Radiated and conducted interference:

- HP 7941A/7945A -- For U.S.A., designed to meet FCC docket 20780 for Class B computing peripheral devices.
- HP 7941A/7945A -- for Europe, designed to meet VDE 0871 for Level B computing devices. FTZ licensed on some HP systems. Refer to your local sales representative for more information.

Magnetic nonoperating: Magnetic operating: <2 milligauss at 2m (7 ft) on all surfaces</p>
<5 gauss on all surfaces</p>

POWER CHARACTERISTICS

Voltages (true RMS):

115V Setting; 230V setting; 100V, 115V, 120V, single phase (inclusive tolerance range is 90V to 132V) 220V, 240V, single phase (inclusive tolerance range is 180V to 264V)

Frequency:

47.5-66 Hz

Maximum Power:

115V setting; 85 Watts (90V, 60Hz) 230V setting; 85 Watts (198V, 50Hz)

Typical Power:

115 setting; 65 Watts (115V, 60Hz) 230V setting; 65 Watts (230V, 50Hz)

Maximum Current (occurs during spin-up):

115V setting; 1.6A (true RMS at 90V, 60Hz) 230V setting; 1.0A (true RMS at 180V, 50Hz)

Typical Current:

115V setting; 0.80A (true RMS at 115V, 60Hz) 230V setting; 0.50A (true RMS at 230V, 50Hz)

Line Dropout:

No effect on performance; no operator intervention required for dropout equal to or less than one cycle of the ac line frequency (20.0 ms, 50 Hz; 16.7 ms, 60 Hz).

ACOUSTIC EMISSIONS

Average sound pressure level (\overline{L}_{pA}) : Sound power level (L_{wA}) :

41 dB(A) 53 dB(A)

SAFETY

- CSA certified to CSA 22.2 No. 154.
- Meets all applicable safety standards of IEC 380 and IEC 435.
- UL listed to UL 114 and UL 478.

ENVIRONMENTAL REQUIREMENTS

Note: The environmental specifications listed herein apply when this subsystem is not connected to a Hewlett-Packard (HP) system. When this subsystem is connected with HP systems, the more stringent environmental and performance specifications listed for any single HP device within the HP system are applicable and supersede these specifications.

The following specifications were type-tested under controlled conditions. Hewlett-Packard maintains an active program of auditing production products to ensure these specifications remain true when products are again tested under the same conditions. The limits of these specifications do not represent the optimum for long, trouble-free operation and are specifically not recommended for maximum customer satisification. The recommended conditions are stated separately where appropriate.

TEMPERATURE

Recommended operating range:

Operating range: Nonoperating range: 20°C to 25.5°C (68°F to 78°F) 5°C to 45°C (41°F to 113°F) -40°C to 60°C (-40°F to 140°F)

Maximum rate of change:

10°C (18°F) per hour

HUMIDITY

Operating:

8% to 80% relative humidity, noncondensing, and wet bulb temperature not to exceed 29 °C (84 °F). For example, this is equivalent to maximum of 80% relative humidity at 32 °C (90 °F), a maximum of 65% relative humidity at 35 °C (95 °F), or a maximum of 46% relative humidity at 40 °C (104 °F).

Nonoperating:

5% to 90% relative humidity, noncondensing and wet bulb temperature not to exceed 29 °C (84 °F). For example, this is equivalent to a maximum of 95% relative humidity at 30 °C (86 °F), a maximum of 50% relative humidity at 38 °C (100 °F), a maximum of 32% relative humidity at 45 °C (113 °F), or a maximum of 10% relative humidity at 60 °C (140 °F).

Table A-8. HP 7941A and HP 7945A Disc Drives Specifications (cont.)

VIBRA	TION
-------	------

Operating (See Figure 2 - 3

Random vibration with power spectral density (PSD) of $0.0001 \text{ g}^2/\text{Hz}$ from 5 to 350 Hz; -6 dB/octave from 350 to 500 Hz; PSD of 0.00005 g^2/Hz at 500 Hz.

Nonoperating (See Figure 2 - 4)

Random vibration with power spectral density (PSD) of 0.015 g^2 /Hz from 5 to 100 Hz; -6 dB/octave from 100 to 137 Hz; PSD of 0.008 g^2 /Hz from 137 to 350 Hz; -6 dB/ octave from 350 to 500 Hz; PSD of 0.0039 g²/Hz at 500

Hz.,

SHOCK

Recommended operating range:

< 0.5 g's

Operating: Nonoperating: 1.5 g maximum at 11 ms, half sine waveform 20 g maximum at 11 ms, half sine waveform

ALTITUDE

Operating: Nonoperating:

maximum 4 600m (15, 000 ft) maximum 15 000m (49,200 ft)

ELECTROMAGNETIC SUSCEPTIBILITY OPERATING RANGE

Radiated:

Recommended limit:

14 kHz to 1 GHz, up to 3 V/m <0.5 V/m

Conducted:

30 Hz to 50 kHz, <3 V rms 50 kHz to 400 MHz, <1V peak-to-peak <0.5 rms

Recommended limit: Electrostatic Discharge: Recommended limit:

<15.0 kV <5. kV<1 gauss, 47.5 to 198 Hz

Power line transients (per IEEE Standard P587.1/F)

Oscillatory wave (100 kHz ringing wave):

Recommended limit:

Unidirectional wave (one 20 us wide pulse): Recommended limit:

<1.5 kV and <50 A (open circuit voltage) <500V <1.0 kV and <100 A (open circuit voltage)

<500V
