1311 DISK DIAGNOSTIC TEST 0021
TEST DATA PROGRAM

A. SCOPE:

This program writes the test data, to be used with DT0022, on cylinder 97 of the CE Disk Pack. The CE Disk Pack can be on any Disk Storage Drive unit, but it must contain the indelible addresses of the first (0) unit. The indelible addresses may be written using DT0020.

B. SETUP:

1. While running the test, the program switches have the following functions:

Switch 1 ON Bypasses error typeouts
OFF Allows error typeouts

Switch 2 Not used

Switch 3 ON Halts on error
OFF Bypasses halt on error

Switch 4 ON Loops test
OFF Halts on test completion

2. During the keying in of data if the user makes an error while typing on the console typewriter, he can turn program Switch 3 on, press RELEASE and START, and then turn Switch 3 off and re-enter the data.

3. Normal setting of console switches:

Program Switches---AS DESIRED

Data Switches-----PROGRAM

4. The user should insure that the PACK ON and READY LIGHTS on the Disk Storage Drive are ON, and the WRITE ADDRESS and the COMPARE DISABLE Switches are OFF. (Compare Disable, IN)

C. DETAILED EXPLANATION:

The test data required for DT0022 is written on cylinder 97 of the CE Disk Pack by this test. The correct indelible addresses must be on the CE Disk Pack before this test will operate properly, and these addresses must be between 00000-19999.

The test has been written in routine form, and groups of routines perform logical functions. The routines that perform logical functions are:

Control Routine

Seek Cylinder Routine

Generate Test Data Routine

Write Test Data Routine

Check Test Data Written Routine

Test Complete Routine

Error Routine

The Control Routine is comprised of a group of routines. The name of the test, switch settings, and pertinent operating instructions are typed out during the execution of the Control Routine. The module number of the Disk Storage Drive unit on which the CE Pack is installed must be entered from the console typewriter during the execution of the Control Routine. After the module number has been keyed in, the drive code digit is calculated and stored in the Disk Control Field sub-instructions. The Drive code is calculated by multiplying the module number by two and adding one to the product. Thus the results are:

| <u>Module No.</u> | <u>Drive Code</u> |
|-------------------|-------------------|
| 0 ✓ | 1 ✓ |
| 1 ✓ | 3 ✓ |
| 2 | 5 |
| 3 | 7 |

The last routine of the Control Routine verifies that the CE Pack is on the Disk Storage Drive Unit being addressed. The verification consists of accessing to cylinder 00 and attempting to read a sector with head 0 and head 1. A file address check should occur on each attempt. Then an access to cylinder 34 is executed, and an attempt is made to read a sector with heads 2 and 3. File address checks should occur on both of these attempts. Similar attempts are made to read sectors on cylinders 35, 36, and 99 using heads 4 and 5, 6 and 7, and 8 and 9 respectively.

If file address checks do not occur on all the reads, it is assumed that the CE Pack is not installed and the message "Disk Pack on 1311 is not CE Disk Pack--Don't use Program" is typed out. The program halts after typing this message, and if the START key is depressed, the Control Routine is repeated.

The Seek Cylinder Routine positions the access mechanism at cylinder 97 by executing a seek instruction and then attempting to read a sector on cylinder 97. If no file address check occurs, the access mechanism is assumed to be at cylinder 97. If a file address check occurs, the complete track is read, the cylinder number is calculated from the data read, and an error message is typed out indicating the cylinder at which the access mechanism is positioned and that it should be 97. This routine will be repeated until the access mechanism is positioned at cylinder 97.

The Generate Test Data Routine is executed after the access mechanism has been positioned at cylinder 97. Two thousand characters of data are generated in the write area (labeled A1) of core. The format is:

```
X0000000001111111111222222222...9999999990000000000
```

```
111111111...999999999
```

X is the head number of the particular track on which the data will be written; therefore, all tracks will contain the same information except for the first character of the track. This routine also insures that all of the VRC indicators are OFF or are turned OFF.

The Write Test Data Routine writes the test data on cylinder 97. A group mark is set in the proper location so that the data can be written using the wrong length record mode. After the data has been written, the ANY DATA CHECK is interrogated. If it is ON, the Error Routine is entered in order that a message can be typed out indicating which indicators are ON. After the error messages have been typed out, another attempt is made to write the test data. A read back check is executed after the test data has been written without turning on the ANY DATA CHECK. ~~After the read back check,~~ the ANY DATA CHECK is interrogated again. If it is on, the Error Routine is entered to type out a message indicating which indicators are on. The read back check instruction is attempted again after the error message is typed out. If no VRC indicator was turned on during the execution of the read back check instruction, the Check Test Data Written Routine is entered. This routine consists of instructions to read the track previously written into a read area (labeled A2) and to make a program compare against the write data. If the read and write data compare, a check is made to see if all ten tracks in the cylinder have been written. If not, updating instructions are executed and the Write Test Data Routine is reentered. If the read and write data do not compare, an error message is typed out, and then the check to see if all tracks have been written is made. The Write Test Data and the Check Test Data Written Routines are executed in order until all tracks in cylinder 97 have been written.

The Test Complete Routine is entered after all tracks have been written. In the Test Complete Routine a Check is made of Program Switch 4. If it is on, the entire Test is repeated until switch 4 is turned OFF. With switch 4 OFF, switch 1 is interrogated. If it is OFF, the test completed message is typed out and the program halts. If switch 1 is on, a check is made of the error map to determine if any errors occurred while running the test. If any errors occurred, a message that the error type outs were suppressed precedes the test complete message.

The Error Routine contains the instructions to type out the error messages, log the fact that an error occurred, and return the program to the proper place after the error message has been typed out.

D. ERROR ANALYSIS:

ERROR OCCURRED BUT SW 1 WAS ON THUS NO ETO. ER 30 01914

This error typeout will occur in the test complete routine if the user has switch 1 ON and an error occurred during the running of the test.

ETO = error typeout.

ACCESS AREM AT XX SHD BE 97. ER22 01014

This typeout will occur if the access arm fails to seek cylinder 97 in order that the test data can be written on it. XX is the cylinder at which

the access arm was positioned. It should have been 97.

All other error typeouts follow the following format:

AAAAAAAAAABBBBBBB (XX) CYL ZZ HD Y

AAAAAAAAA, is the program disk operation that the error occurred on.

The disk operation are all WITH WRONG LENGTH RECORD CHECK.

The messages that can be typed are:

WRITE 20 SCT ER3 01554

The program is writing 20 sectors (1 track) of test data from area A1 in memory onto a track on the Disk Pack.

READ BACK COMP ER4 01614

The program is read back track check of the data written onto the Disk Pack out of area A1 in memory.

READ 20 SCTR ER5 01674

The program is reading the 20 sectors written, back into area A2 in memory.

PROG COMPARE ER6 01758

The program is doing a compare of the 20 sectors of data written from area A1 and read back into area A2.

SEEK ER8 00942

The program has performed a seek operation.

BBBBBBB(XX), is the error that occurred and turned on Any Data Check. Where XX is the indicator.

The messages that can be typed are:

| | | |
|------------------|------|-------|
| ADS CK (36) | ER10 | 02058 |
| WLR CK (37) | ER11 | 02130 |
| OVFO CK (38) | ER12 | 02154 |
| RD CK (06) | ER14 | 02190 |
| WR CK (07) | ER15 | 02214 |
| MBR-E (16) | ER16 | 02238 |
| MBR-0 (17) | ER17 | 02262 |
| FILE NO IND (39) | ER13 | 02154 |

The program found any file indicator on, but all the indicators which turn it on are off.

| | | |
|----------------|-----|-------|
| DATA NOT EQUAL | ER7 | 01782 |
|----------------|-----|-------|

The 20 sectors of test data written onto the Disk Pack does not compare with the data that was read back into memory.

| | | |
|-------------|------|-------|
| SELECT LOCK | ER19 | 02058 |
|-------------|------|-------|

Self-explanatory

| | | |
|-------------|-------|-------|
| CYL ZZ HY Y | ER 20 | 02370 |
|-------------|-------|-------|

This is the rest of the error typeout that tells the user which cylinder (CYL) the error occurred on, where ZZ will be from 00 to 99. And also which head (HD) or track was

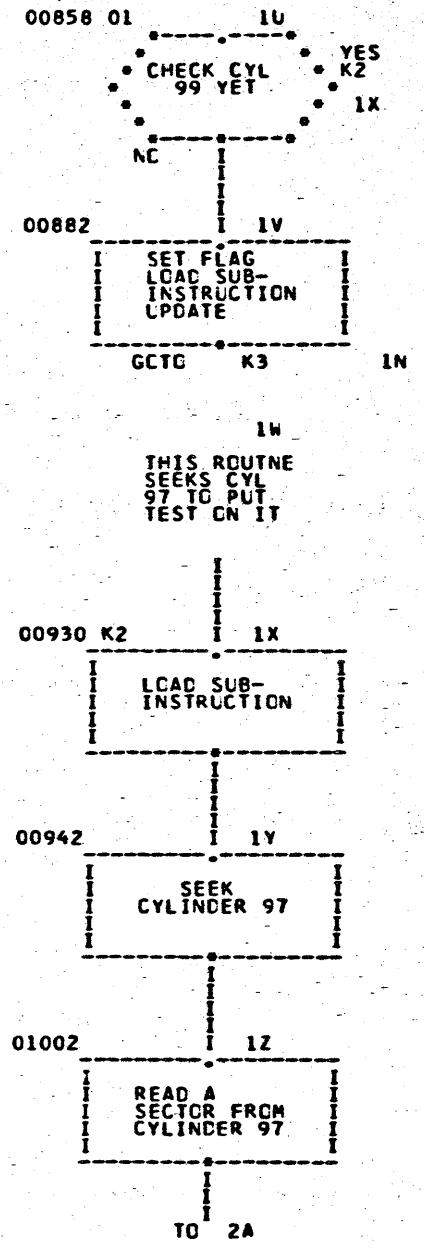

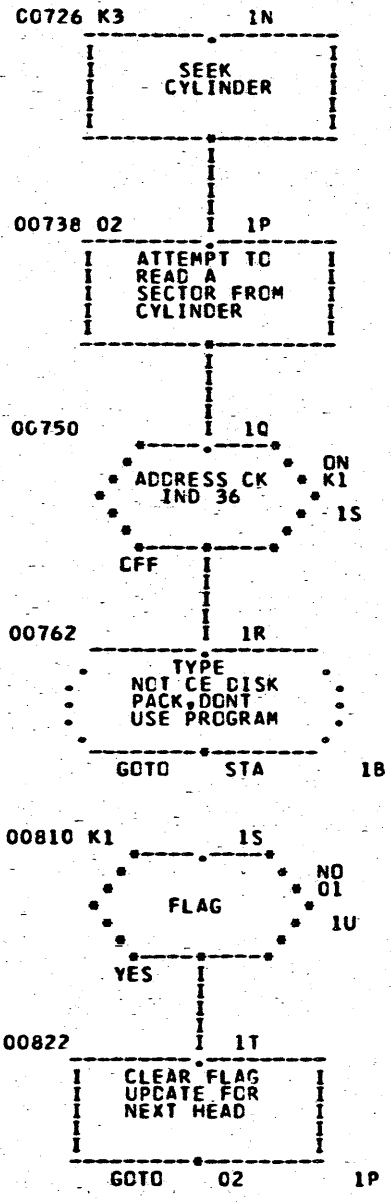

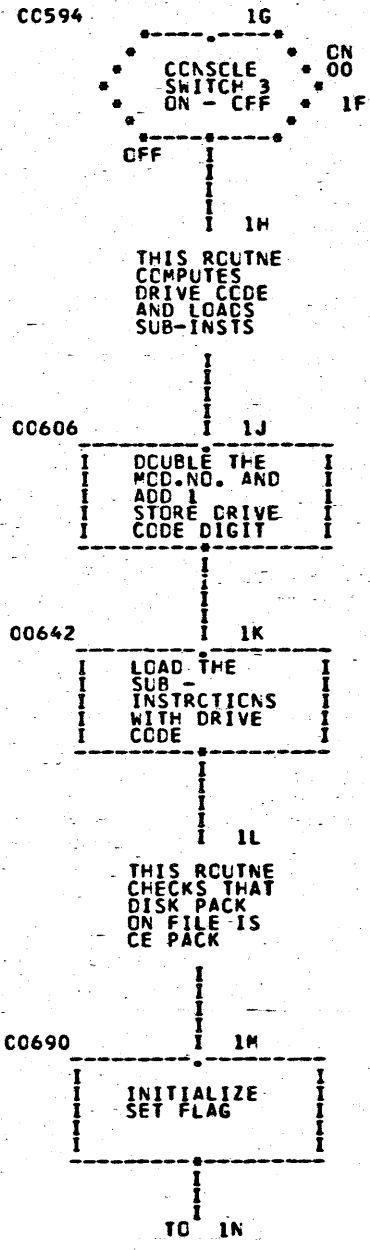

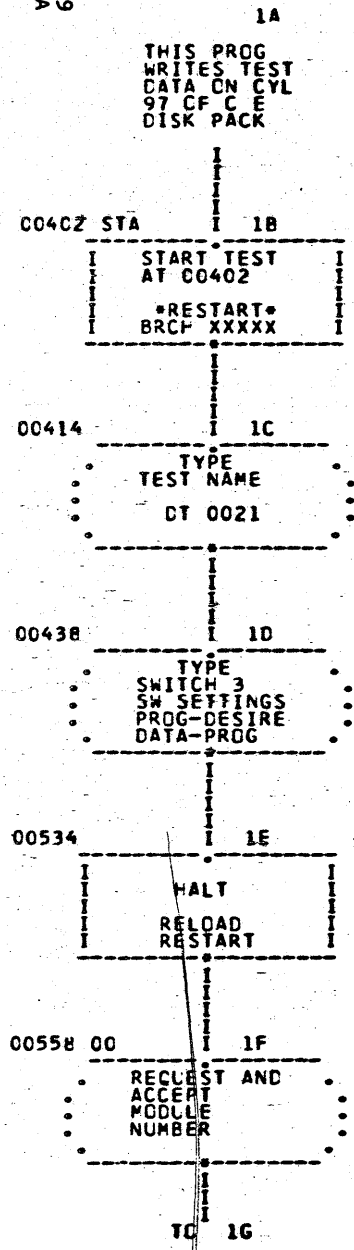

in error on that cylinder, where Y will be from 0 to 9.

E. SERVICE HINTS:

This test is not intended to be a diagnostic; however, all the test data that is written on the file is read back into memory and compared.

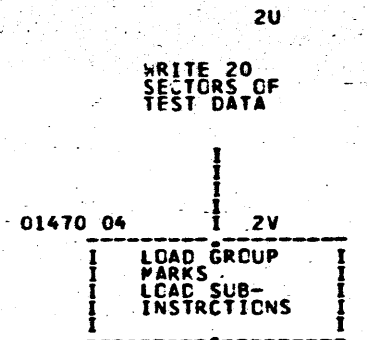

If the program runs successfully, the assumption may be properly made that the computer can write to and read from the Disk Storage Drive.
