

# 3278 Display Station Models 1, 2, 3, 4, and 5 Maintenance Information

#### Seventh Edition (January 1981)

This is a revision of SY27-2510-5, which is now obsolete. It incorporates minor technical changes. Changes or additions to the text and illustrations are indicated by a vertical line to the left of the change. Information in this manual is subject to change from time to time; any such change will be reported in subsequent revisions or Technical Newsletters.

The drawings and specifications contained herein shall not be reproduced in whole or in part without written permission.

IBM has prepared this maintenance manual for the use of IBM customer engineers in the installation, maintenance, or repair of the specific machines indicated. IBM makes no representations that it is suitable for any other purpose.

It is possible that this material may contain reference to, or information about, IBM products (machines and programs), programming, or services that are not announced in your country. Such references or information must not be construed to mean that IBM intends to announce such IBM products, programming, or services in your country.

Requests for copies of IBM publications should be made to your IBM representative or to the IBM branch office servicing your locality.

A form for readers' comments is provided at the back of this publication. If the form has been removed, address comments to IBM Corporation, Department 52Q, Neighborhood Road, Kingston, N.Y., U.S.A. 12401. IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation whatever. You may, of course, continue to use the information you supply.

### Preface

This publication contains the information needed to service and maintain the IBM 3278 Display Station Models 1, 2, 3, 4, and 5. Part numbers for the usually needed field replaceable units (FRUs) are given in Chapter 4; keyboard assembly FRUs are given in paragraph 6.7 (Chapter 6). Additional information on the ordering of parts is contained in the *IBM 3278 Display Station Parts Catalog*, order number S126-0020.

### Organization

This publication has seven chapters:

- Chapter 1 is a brief introduction to the 3278 and to the maintenance plan for the 3278.
- Chapter 2 contains the maintenance analysis procedures (MAPs).
- Chapters 3 through 7 contain reference material that supports the MAPs.

Appendix A, Glossary, defines terms used in this publication.

### **Starting Point**

The starting point for all failure isolation on the 3278 is MAP 00, Start/Restart MAP.

### Contents

#### Safety Notices

DANGER:	All power unit removal and
	replacement procedures must be
	performed with power turned off and
	with the power cord disconnected.

DANGER: All persons handling a CRT or who are near an exposed CRT under vacuum must wear safety glasses and long-sleeved garments.

DANGER: High voltage can be present when Indicator 2 is off.

DANGER: Safety glasses must be worn when you are working on the machine with power on or off.

DANGER: Voltages are present in the heat sinks on the analog card when the power is on. Also, be careful when removing this card because the heat sinks will be hot (at high temperatures).

DANGER: Ferrocapacitor 01D/C1 is grounded only when the capacitor is retained by its mounting spring.

> The machine frame is grounded only when the prime power assembly 01D/A1 is mounted and fastened in place.

The ferrotransformer assembly 01D/T1 is grounded only when it is mounted and fastened in place.

Caution: The CRT weighs about 7.25 kg (16 pounds). Protect and support the CRT when removing and replacing it to prevent damage to the CRT and other units.

Caution: The 3278 must be off before cards and cables are reseated or swapped. Be careful not to loosen cards or cables when working on the 3278. This could cause intermittent failures then or at a later time.

Caution: The indicator above the ON/OFF switch is not a primary Power On indicator. Machine voltage may be present when this indicator is off.

Caution: Do not connect or disconnect the device cables during an electrical storm.

## **CE SAFETY PRACTICES**

All Customer Engineers are expected to take every safety precaution possible and observe the following safety practices while maintaining IBM equipment:

- 1. You should not work alone under hazardous conditions or around equipment with dangerous voltage. Always advise your manager if you MUST work alone.
- Remove all power AC and DC when removing or assembling major components, working in immediate area of power supplies, performing mechanical inspection of power supplies and installing changes in machine circuitry. Pull the power plug from the receptacle to remove power source.
- Wall box power switch, when used to disconnect power, should be locked or tagged in off position. "Do not Operate" tags, form 229-1266, should be securely attached to power switch or to outside of power box.
- 4. When it is absolutely necessary to work on equipment having exposed operating mechanical parts or exposed live electrical circuitry anywhere in the machine, the following precautions must be followed:
  - a. At least one other person familiar with power off controls, emergency power off procedures, and the location of the wall box power switch, must be in the immediate vicinity at all times.
  - b. Rings, wrist watches, chains, bracelets, metal cuff links, shall not be worn.
  - c. Only insulated pliers and screwdrivers shall be used.
  - d. Keep one hand in pocket.
  - When using test instruments be certain they are of proper capacity and controls are set correctly. Only insulated probes are used.
  - f. Avoid contacting ground potential (metal floor strips, machine frames, etc. – use suitable rubber mats purchased locally if necessary).
- 5. Safety Glasses must be worn when:
  - a. Using a hammer to drive pins, riveting, staking, etc.
  - b. Power hand drilling, reaming, grinding, etc.
  - c. Using spring hooks, attaching springs.
  - d. Soldering, wire cutting, removing steel bands.
  - e. Parts cleaning, using solvents, sprays, cleaners, chemicals, etc.
  - f. All other conditions that may be hazardous to your eyes. REMEMBER, THEY ARE YOUR EYES.
- Special safety instructions such as handling Cathode Ray Tubes and extreme high voltages, must be followed as outlined in CEM's and Safety Section of the Maintenance Manuals.
- Do not use solvents, chemicals, greases or oils that have not been approved by IBM.
- 8. Avoid using tools or test equipment that have not been approved by IBM.
- 9. Replace worn or broken tools and test equipment.
- The maximum load to be lifted is that which in the opinion of you and management does not jeopardize your own health or well-being or that of other employees.

- 11. All safety devices such as guards, shields, signs, ground wires, etc., shall be restored after maintenance.
- 12. Each Customer Engineer is responsible to be certain that no action on his part renders product unsafe or exposes hazards to customer personnel.
- 13. Place removed machine covers in a safe out-of-the-way place where no one can trip over them.
- 14. All machine covers must be in place before machine is returned to customer.
- 15. Always place CE tool kit away from walk areas where no one can trip over it (i.e., under desk or table).
- 16. Avoid touching mechanical moving parts (i.e., when lubricating, checking for play, etc.).
- 17. When using stroboscope do not touch ANYTHING it may be moving.
- Avoid wearing loose clothing that may be caught in machinery. Shirt sleeves must be left buttoned or rolled above the elbow.
- Ties must be tucked in shirt or have a tie clasp (preferably nonconductive) approximately 3 inches from end. Tie chains are not recommended.
- 20. Before powering up or starting equipment, make certain other CEs and customer personnel are not in a hazardous position.
- 21. Maintain good housekeeping in area of machines while performing and after completing maintenance.
- 22. Even though preventive measures are taken, accidents do occur. CEs and support personnel should be prepared to follow emergency first aid procedures as outlined below.

#### First Aid - General

- 1. If accidental electrocution occurs:
  - a. Remove power source before touching victim.
  - b. If power cannot be removed, pull victim away from equipment by using non-conductive material such as a broom handle, leather belt, or necktie.
  - c. Immediately begin rescue breathing; see below.
  - d. Begin CPR if necessary and only if trained person is available.
  - e. Call a doctor.
    - Have someone summon medical aid.
  - f. Remain in position. After victim revives, be ready to resume respiration
- if necessary. 2. For serious injury:
  - a. Summon medical aid.
  - b. Do not move victim unless absolutely necessary to remove from danger.
  - c. Attempt to stop serious bleeding by using pressure points or a pressure bandage.
  - d. Loosen clothing and keep victim warm.

#### **Artificial Respiration**

General Considerations

 Start Immediately, Seconds Count Do not wait or look for help or stop to loosen clothing, warm the victim or apply stimulants.

#### SY27-2510-6

2. Check Mouth for Obstructions Remove foreign objects – Pull tongue forward.

#### Rescue Breathing for Adults – Place Victim on His Back Immediately

- 1. Clear throat of water, food, or foreign matter.
- 2. Tilt head back to open air passage.
- 3. Lift jaw up to keep tongue out of air passage.
- 4. Pinch nostrils to prevent air leakage when you blow.
- 5. Blow until you see chest rise.
- 6. Remove your lips and allow lungs to empty.
- 7. Listen for snoring and gurglings, signs of throat obstruction.
- Repeat mouth to mouth breathings 10-20 times a minute. Continue rescue breathing until he breathes for himself, or medical aid arrives.

Thumb and finger positions

### Chapter 1. Introduction

### 1.1 General

The IBM 3278 Display Station must be attached to a port of the IBM 3274 Control Unit or of the IBM 3276 Control Unit Display Station (or other compatible controllers) by a coaxial cable. The 3278 contains field replaceable units (FRUs), as shown in Figures 1-1 and 1-2.

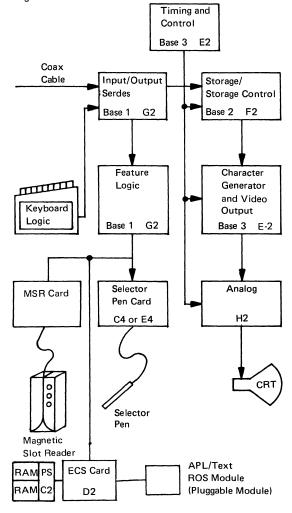

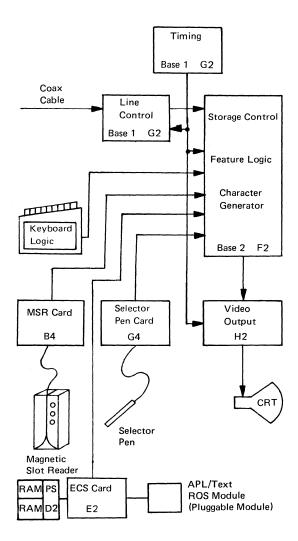

Figure 1-1. 3278 Field Replaceable Units, (D) Type

There are two configurations of the logic for the 3278 Display Station. The first is the (D) type, shown in Figures 1-1, 4-6, and 4-7. Three base logic cards are used in this configuration: base 1 (G2), base 2 (F2), and base 3 (E2). The second configuration, the (M) type, shown in Figures 1-2, 4-8, and 4-9, has two base cards: base 1 (G2) and base 2 (F2). Note the new locations of the feature cards when present with the second configuration.

The 3278 Display Station Model 5 has the (M) configuration only, and can display either an 80- or a 132character line. The offline test describes the method for testing and aligning the Model 5.

The (D) type basic logic is packaged on three cards, one 2WX3H and two 4WX3H, and contains basic functions as follows:

Base card 1 - 01A/A1G02

Interface to coax, command decode and gates, and paths to features.

Base card 2 – 01A/A1F02 Storage, counters, and storage control.

Base card 3 – 01A/A1E02

Character generator, dot character line and row counters, video serializer, and control.

The (M) type base logic is packaged on two cards, one 2WX3H and the other 4WX3H. Most of the basic functions are contained in the 4W card, which is located at 01A/A1F2. The interface to the coax cable, the dot counter, and the video serializer are located on the card in 01A/A1G2.

### 1.1.1 Magnetic Slot Reader

The magnetic slot reader (MSR) and the magnetic hand scanner (MHS) accessories allow the 3278 to enter data recorded on a magnetic stripe. They attach to the display station through a cable. The magnetic slot reader reads information when a magnetic striped card is passed through a slot in the reader. The magnetic hand scanner reads data when it is passed over a magnetic stripe. (The magnetic hand scanner is only supported on a 3278 attached to a 3274 customized for the alphanumeric character set.)

#### 1.1.2 Selector Pen

The Selector Pen feature for the 3278 Display Station is used to select a field or fields displayed on the screen. The point of the pen contains a device that can detect the light of a character on the screen; pressing the point of the pen against the screen activates a switch in the point.

### 1.1.3 APL/Text

The APL/Text feature allows users to use APL or Text applications at the 3278. A 3278 with APL/ Text installed can:

- Display the 222-character-plus-space APL/Text character set.
- Be used to enter 94 EBCDIC characters and 81 APL-specific characters plus space on the APL keyboard.
- Be used to enter 94 U.S. English characters and 65 Text-specific characters plus space on the Text keyboard.

### 1.1.4 Electrical Grounding

The 3278 is electrically connected between ac and dc returns at the unit. A ground wire is attached from the upper chassis to the gate and then to dc return at card location 01A/A1H2P8.

The coax return (shield) is isolated from the dc return at the 3278. With the ac power cord disconnected, a correctly wired unit should indicate continuity between ac and dc ground, and an open circuit between the customer coax shield and the 3278 dc ground. Major frame static points exist around the CRT area of the machine. Poor or no contact at these points may cause intermittent or erratic display operation such as:

- No display (blank screen)
- Erratic raster on the lower or the upper half of the screen
- A bright miniature raster in the center of the screen
- The high-voltage power supply cycling on and off
- A single line on the top of the screen

If the initial MAP procedures do not isolate the erratic display problem, check the following static ground points before retrying the MAPs.

- CRT harness (see Figure 4-5)
- Yoke shield and CRT connector (see Figure 5-1)
- Yoke/centering rings (see Figure 5-3)
- Contrast/intensity control (see Figure 4-5)
- Yoke grounding clips (see Figure 5-3)

The brightness-contrast assembly is grounded through a spring clip located behind the brightness assembly. Verify this connection by removing the brightness knob and checking for continuity between the frame and the brightness potentiometer shaft. (See Figure 4-5.)

Failure to maintain good grounding connections at all ground locations may cause erratic POR reset operation.

### 1.1.5 Equipment Lightning Protection

The 3278 is designed to provide a low-impedance energy path from the external coax shield to frame (ac) ground for potentials above 36 V. Additional information on lightning protection for the customer coax (customer responsibility) is provided in the *IBM 3270 Information Display System: Installation Manual—Physical Planning*, GA27-2787.

#### 1.2 Maintenance Plan

The maintenance plan for the 3278 uses the following:

- Operation tests to sense failures, both for problem determination and for verification.
- FRU swapping as an aid to failure isolation.
- Maintenance analysis procedures (MAPs) to give a planned procedure to isolate and repair any failure on the 3278.

#### 1.3 Operation Tests

Operation tests include offline and online tests.

- Offline tests (Test mode) The 3278 offline tests are activated by placing the Normal/Test switch in the Test position, taking the 3278 offline from its control unit, and putting it in Test mode.
- Online tests— The 3278 online tests are in the control unit to which the 3278 is attached. Online tests may be requested from any online display station with a keyboard, and may be run on any specified online terminal attached to the same control unit. The results of the test are displayed at the requesting display station. Online tests include a routine to display the error log for any terminal attached to the same control unit, and for the control unit.

Operation tests are described in detail in Chapter 3.

#### 1.4 FRU Swapping

The FRU swapping procedures are given in the MAPs in Chapter 2; FRU locations and part numbers, in Chapter 4.

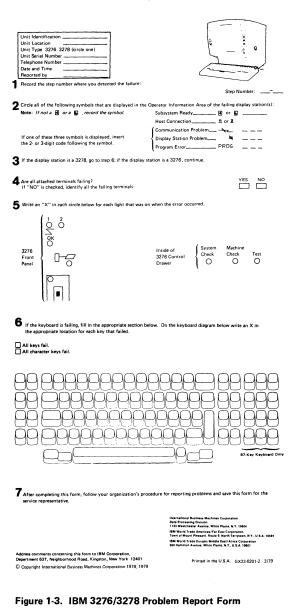

#### 1.5 MAPs

The MAPs are designed to give a quick and effective procedure for isolating and repairing any problem on the 3278. To use the MAPs effectively, you must observe the following rules:

 Before the 3278 MAPs are used, the customer should have performed problem determination, using the 3278 Problem Determination Guide (PDG), located under the keyboard handrest.

- 2. If a failure was sensed while the 3278 PDG was being used, the failing step number was recorded on a problem report form (GX23-0201, or GX18-1033 for Japanese English or Katakana; see Figure 1-3). This step number will be useful when the MAPs are being used.
- If the failure is intermittent, cards and cable connectors should be checked for correct seating, and voltages should be checked for correct tolerances as described in MAP 01. Check the tightness of the screws on the capacitors in the low-voltage power supply.
- The 3278 should be online to its control unit unless the MAP instructs you to place the 3278 offline. If the 3278 is offline (in Test mode), some of the symptoms may differ from those for which the MAPs were designed.
- 5. The MAPs will instruct you to reseat/swap cards in a specific sequence. The first card is the first probable cause of the failure, the next card is the next probable cause, etc.
- Always reseat the cards and their associated cables, and test before swapping parts. Reseat the cables, and check the capacitor screws for tightness before swapping the low-voltage power supply.
- 7. When the analog card (card 01A-H2) is swapped, the new card may need adjustment.
- 8. Always reinstall the original part when the new part did not repair the problem.
- 9. If you go through the MAP once without repairing the problem, go back to the starting point and go through the MAP a second time. If, after a second pass through the MAPs, the trouble is not repaired, call for assistance.
- 10. The ECS card 01A/A1D02 (D) or 01A/A1E2 (M) may contain a pluggable APL/Text character generator ROS module. Static discharge can damage the ROS module if you do not follow proper grounding procedures when handling a loose module, that is, one not installed in a card socket. Hand contact should first be made to the foam or wrapping in which

### IBM 3276/3278 Problem Report Form

the module is packed. Also, while holding a module to be installed in a socket, first make hand contact to the socket pins to drain off any static charge.

 Terminals that have the ECS feature, card location 01A/A1D02 (D), will have the selector pen card in location 01A/A1E4. All references to the selector pen card for the (D) type will be location 01A/A1C04 or 01A/A1E4.

Caution: The 3278 must be off before cards and cables are reseated or swapped. Be careful not to loosen cards or cables when working on the 3278. This could cause intermittent failures then or at a later time.

1-9

## Chapter 2. MAPs

### MAP 00, Start/Restart MAP

Start here to isolate any failure on the 3278 Display Station.

Note: The two different logic types used in the 3278 are indicated by (M) and (D): (M) indicates the logic using two base cards (Figures 1-2 and 4-8); (D) indicates the logic using three base cards (Figures 1-1 and 4-6). Throughout the MAPs an (M) or a (D) will follow the card callouts to indicate in which logic the problem card is located. Where neither (M) nor (D) is indicated, the card is the same for both logic types.

### 001

2 A

(Entry Point A)

Is this the first time through this MAP ?

(Highly intermittent or not failing now; take NO leg.) Y N

> Use the Error Log and Error Code to FRU list (par. 3.3.2.3); use the Symptom/Repair List to aid you in developing your action plan. A few examples are:

- Swap suspected FRU; for example, if 3276 log shows 41 and 77 errors, swap A-G2 for isolation.
- 2. Request a Retain Data Bank/EWS Search (based on logged error codes, gathered data, and your observation of the problem).
- Check voltages for proper levels and/or ripple. (See Figure 4-11; all voltages are ± 10%.) See par. 5.4 for 44 V adjustment.
- 4. Check the ferrocapacitor for proper operation by doing the following:
  - a. Switch off the unit.
  - b. Discharge the capacitor by performing steps 1, 2, and 3, from par. 6.2.2.
     Note: Exchange the capacitor if it is distorted from internal pressure.

c. Set the CE meter to the R x 1K scale.

- d. Touch the test leads of the CE meter across the capacitor terminals; the meter should momentarily deflect. Reverse the meter test leads; the meter should deflect again. If there is no meter deflection, exchange the ferrocapacitor.
- 5. Check coax connectors and electrical grounding as described in par. 1.1.4
- 6. Contact FSC/Branch Support for assistance.

H 3

Exchange failing fuse or fuses. Switch Unit On. (Wait 30 sec.) Did fuse or fuses fail again?

## γN

#### 019

Verify correct operation. If problem occurs again start over at Entry Point A of this MAP to identify new symptom.

### **0**20

Switch unit off. Remove 01A/A1H2 card and exchange fuse(s). Switch Unit On.

### Did fuse(s) fail again?

( N

#### 021

Switch unit off.

Exchange 01A/A1H2 card and adjust.

If fuse fails after new 01A/A1H2 card is installed problem can be in high voltage power supply or yoke.

Remove connector on high voltage power supply and yoke to isolate.

#### **.** 022

Switch unit off.

Short is in Low voltage power cable logic cards or keyboard. Reinstall 01A/A1H2 removed in step 20.

Remove logic cards and keyboard cable. Exchange failing fuse and switch unit on. Did fuse fail again?

γŅ

55 .1 K

### **Terminal Failure MAP**

PAGE 5 OF 13

### **023**

Exchange logic cards one at a time in the following sequence; 01A/A1G2, F2, E2 (D), or 01A/A1F2, G2 (M).

Switch unit off and ON for each exchange. (Permit 30 sec. for power to be on each time).

If fuse does fail after a card is reinstalled, exchange that card with a new card and start over.

If fuse does not fail when all the logic cards are reinstalled, reconnect keyboard cable. If reinstalling the keyboard cable causes the fuse to fail exchange the keyboard logic card. Should exchanging of the keyboard card not repair the problem the keyboard should be exchanged.

#### **024**

Repair or exchange the Low Voltage cable. See Figure 4-12 for wiring figure.

#### **.** 025

Remove Line Power cable from power outlet.

Switch Unit On switch to ON and measure resistance across pins of line power cable plug.

(This is a continuity test of the line power cable, main power box, power switch, ferro primary and fuse F1 in the main power box, normal is less than 5 ohms.)

#### Measures 5 ohms or more? Y N

# Chapter 3. Maintenance Aids

## 3.1 Introduction

Maintenance aids for the 3278 Display Station include switches, indicators, and diagnostic tests.

# 3.2 Switches and Indicators

The 3278 switches and indicators are described in Figures 4-1 and 4-2 in Chapter 4.

# 3.3 Operation Tests

Operation tests are used to sense failures both for problem determination and for repair verification. Both offline and online tests are available.

# 3.3.1 Offline Tests

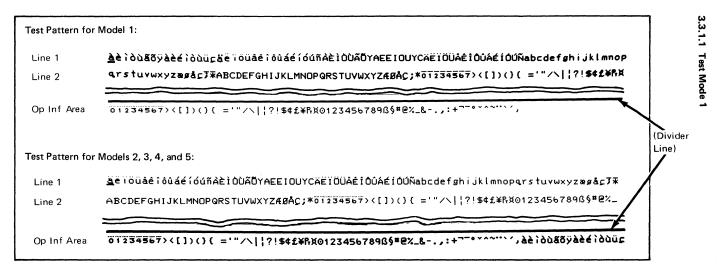

The 3278 offline tests are in 3278 logic. The test logic is activated by setting the Normal/Test switch to the Test position, taking the 3278 offline to its control unit, and putting it in test mode. There are three test modes: Test Mode 1, Test Mode 2, and Test Mode 3.

SY27-2510-6

# DISPLAY STATION TEST

- Tests 3278 Display Station offline from the control unit.
- Does not test coax driver/receiver and display features; they may be tested with online test 0 (refer to 3.3.2.2).

Test Name	Activity	Result
Test Mode 1: Pattern Display	Displays a predetermined pattern of characters. Mode Entry: Set Aa/A to Aa. Set Normal/Test to Test.	Fills display with pattern of characters shown in Figure 3-1, 3-2, or 3-3. Compare the test pattern lines shown in the figure with the corresponding lines on the screen. Verify that the characters are in correct sequence. This is a test of the <i>character generator, storage</i> , and <i>control logic</i> . Character-generator failure causes wrong or defective characters to be displayed at any point or points on the screen, and control failure affects all characters.

	Function	Models 1 – 4	Model 5		
	Reverse and blink cursor Reverse cursor	, (comma) ' (apostrophe)	s		
	Blink cursor	=	R	132-character	
	Normal cursor	Space key	Q	length only	
	Inhibit cursor	1	U		
and the second second	Inhibit display	? 			
	Change from 132- to 80-character length (Model 5 only)	and and a second se Second second second Second second	٩		
22	Press Control key, then C key, ther Press B key twice, then Control key				

23	Press W key.	
24	Press 🐱 key.	
	Press Control key.	
25 ·	Press G key.	
26	Press A key	All positions from top left of screen to first "a" become 0.
	Press Control key.	
	Press B key.	Loads first position of operator information area with 3.
	Press B key again, then Control key.	
27	Press O (alpha) key	(Prepares for testing display intensity control.)
28	Press I (alpha) key.	All characters on screen display with high intensity,
	Press Control key, then B key twice.	except operator information area.
	Press Control key.	Cursor advances to first (*) in row 2.
29	Press O (alpha) key.	
30	Press Q key.	All characters from cursor's previous position to end of
		screen and characters on the first line to the first lowercase
		"a" display with normal intensity. Cursor also advances
		to row 3.

Test Name	Activity	Result
Test Mode 3 (Cont'd) 31	Switch power off, then on Press Control key, B key twice, then Control key.	Power-On Reset occurs.
32	Press G key twice. Press Control key, then B key twice. Press Control key.	All positions become 0 except operator information area.
33	Press G key twice Press Control key. Press B key twice.	Operator information area displays 0s. Note: All references to keys to be used in Test Mode 3 are identified by the diagram shown for Test Mode 2. (Do not identify keyboard keys by the characters that appear on the keytops.)
34	Press M key.	
35	Press and hold 2 key until 2's appear in top line ((D) type). Press and hold 3 key until 3's appear in top line ((M) type).	
36	Press and hold 4 key to enter eight to ten 4's ((D) type).	

3-16

	Press and hold 5 key to enter eight to ten 5's ((M) type).	
37	Press and hold 8 key to enter eight to ten 8's ((D) type). Press and hold 9 key to enter eight to ten 9's ((M) type).	
38	Press Control key: press B key twice, then Control key.	
39	Press W key	
40	Press ∓ key. Press Control key. Press B key twice, then Control key.	
41	Press S key.	
42	Press 2 key Press 3 key Press Control key.	Cursor moves back to last 2 entered ((D) type). Cursor moves back to last 3 entered ((M) type).
43	Press B key twice, then Control key.	
44	Press Q key.	

Test Name		Result
45	Press 8 key.	Cursor moves forward to first 8 entered ((D) type). Cursor moves forward to first 9 entered ((M) type).
*****	This concludes tests that can be performed by the Offline Test (Test Mode). Display station features must be tested online; see Online Test 0 (par. 3.3.2.2).	

Test Mode

The 3278 online tests are in the control unit to which the 3278 is attached. When the 3278 is attached to a 3274 or 3276, online tests may be requested from any online display station with a keyboard, and may be run on any online terminal attached to the same control unit. Results, if any, of the test are displayed at the requesting display station. Eight online tests can be selected:

Test 0 – Display Operation	
Test 1 — Error Log Display	
Test 2	
Test 3	
Test 4 – Error Log Erase (for 3274, erases error log for selec	ted device;
for 3276, erases entire error log)	
Test 5	
Test 6	
Test 8 – PS Feature Test Pattern	
(Refer to the control unit documentation for a description of te	ests 2, 3, 5,
and 6.)	

When the 3278 is attached to a control unit/adapter other than a 3274 or 3276, refer to the documentation for the control unit/adapter for the differences to the online tests.

## 3.3.2.1 Requesting Online Tests

Test primarily terminal adapter and coax—and, through interactive test (Test 0, Routine 3), also display station.

- Error log display and erase functions (referred to as "tests").
- Test requesting display—or another display (or printer DA and coax) specified by requesting display.
- Display test results at requesting display.
- Run concurrently with customer application in subsystem (but station to be tested must not be in session if SNA, and not in WAIT state if BSC).

Objective Activity		Result		
1. Start test.	Press and hold ALT; strike TEST, and then release both keys.	Display is cleared. TEST is displayed in operator information area.		
<ol> <li>Do one of following:</li> <li>Run test 0 on requesting display.</li> <li>Run test 0 on display other than requesting display.</li> </ol>	Key in: / Press: Enter Key in: AA/ { AA is port address Press: Enter { of display to be tested.	Test 0 begins. Test 0 begins. See par. 3.3.2.2 for test details.		
<ul> <li>Run test other than 0 on requesting display.</li> </ul>	Key in: /B Press: Enter { B is number of selected test to be run (1,2,3,4,5,6,or 8)	Selected test begins.		

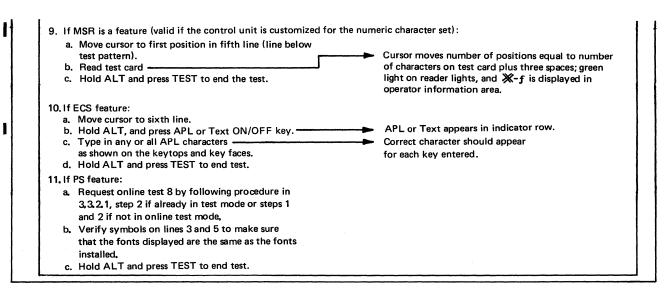

<ul> <li>Run test other than 0 on terminal other than requesting display.</li> </ul>	Key in: AA/B Press: Enter	Selected test begins.
3. Re-enter if X symbol is displayed,	<ul> <li>You tried to select an in-session terminal for test 0</li> <li>You used an invalid test number or address.</li> <li>You used more than one slash (/) and/or had space(s) in your format.</li> <li>You did not begin test format at position 0 (upper-left position of display).</li> </ul>	Do Not Enter ×, Op Check え, and Function Not Available -f are displayed in operator information area. Do Not Enter ×, Op Check え, and Wrong Number # ? are displayed in operator information area.
	Press Reset; re-enter test format.	Only TEST is displayed.
4. Interpret test results.	Invoking message is retained and is suffixed with +, -, or 0, where: + = succeeded - = failed 0 = device power off routine number.	Example: AA/ TA Address Test 0 Routine 2 Failed <i>Note:</i> Applicable only to Test 0.
5. Continue test.	Press and hold ALT, and strike CLEAR.	Enter another test (step 2).
6. End test.	Press and hold ALT; strike TEST and then release ALT.	TEST is erased from display.

Test or Routine Name	Activity	Result	
Test 0: Display Function.	To determine that terminal is functioning overall.		
Routine 1: TA Test (3276 only)	Check basic TA functions—register, serdes, command decoder, etc., operations; driver/ receiver operation excluded.	Stop on error. Display test result on requesting display. If no error, go to next routine.	
Routine 2: Link Test (3276 only)	Check link by issuing Reset and receiving a POR response.	Stop on error. Display test result on requesting display. If no error and if a display is being tested, go to next routine; otherwise stop.	
Routine 3: Interactive Test (Display only; not for printer)	Permit operator testing of selector pen and keyboard functions. Display test pattern. Sound audible alarm (if feature is installed).	Test pattern is displayed; it and test procedure are described below.	

	Test Pattern Definition		Test Pattern	
Line 1:	CCCC identifies the control unit (3274 or 3276) to which the 3278 is attached. NN is the port number (00 through 31).	(Line 1) (Line 2) (Line 3)	TEST: CCCC ?SEL PEN &SEL PEN	NN SEL PEN > SEL PEN
Line 2:	?SEL PEN and SEL PEN are high-intensity, protected, and selector-pen-detectable fields.	(Line 4)	DISPLAY	INSERT CK
Line 3:	&SEL PEN and > SEL PEN are normal- intensity, protected, and selector-pen- detectable fields.			
Line 4:	Non-display field with NON preceding normal-intensity and protected field DISPLAY INSERT. If blanking circuits on analog card fail, NON can be seen. CK (and two null characters) is normal-intensity, unprotected, and non-detectable field, followed by another normal-intensity, unprotected, and non-detectable field containing cursor.			

(Routine 3: Interactive Test, Test Procedure)	
Test Procedure	Result .
1. Move cursor under C of CK.         2. Press â key.         3. Press A.         4. Press B.         5. Press C.	<ul> <li>(displays in operator info area)</li> <li>DISPLAY INSERT ACK (displays in fourth line)</li> <li>DISPLAY INSERT ABCK (displays in fourth line)</li> <li>DISPLAY INSERT ABCK (no change in fourth line)</li> <li>X ± &gt; (displays in operator info area)</li> </ul>

3.3.2.2 Test 0, Display Operation

### 3.3.2.3 Test 1, Error Log Display

From the last time that control unit power was turned on, all errors sensed by the control unit were recorded in the error log. When control unit power is turned off, the error log is erased. The error log for any terminal attached to the control unit can be displayed by requesting online test 1. The following error log formats are displayed at the requesting display station:

3274 Error Log

Line, AA/	/1				w-order digits of the 200	), 300, 400, and 500	
Co	oax port addres	is 00-31	series nnn i	numbers, 200 lettr	most to 500 rightmost.		
Line 2	2233	4455		. Displays the static	stical-counter information	on associated with this devic	ce.
Line 3	XXXX	XXXX	<u>xxxx</u>				
			Count of f	feature errors since	e last power on.		
			Count of bad s	status received from	n the base since last pow	er on,	
		Numb	er of device check	ks (buffer parity en	rors) since last power or	I.	
		Not applica	able.				
	Numb	er of coax par	ity errors since las	st power on.			
	Number of	f coax timeout	s since last power	on.			

#### For example:

03/1 0400 0000 0000 0002 0000

The last error detected by the display was error code 204. This was a storage error (buffer parity error). Two of these errors have been detected since the display was powered on.

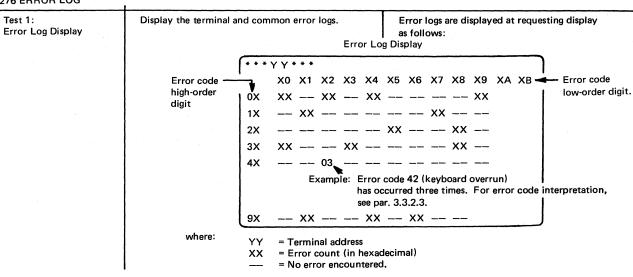

#### 3274 Display Error Log Codes

These errors appear on the screen as X 2xx, where xx is one of the 2-digit numbers listed below.

02	=	"Hot tube". Normally, error code	11	=	Invalid Status received
		is seen in log of another terminal.	12	=	Invalid Scan Code received
03	=	Feature bus error	22	=	Invalid Selector Pen Status or
04*		Storage error			Command Q failure
05	=	Unsupported feature attached	23		ECS buffer parity
06	=	Incorrect feature address	24	=	Invalid MSR Status or Command Q failure
07*	=	Lost Op Complete this display	25	=	ECS Status/Initialization error
08	=	Invalid Op Complete (received	26	=	ECS Command Q failure
		unexpected Op Complete)	27	=	ECS WRT ALT/Command Q failure
09*	=	Command Q failure	34	=	ECS without ROS extension
10	=	Invalid keyboard attached (no table)			

#### 3276 ERROR LOG

3.3.2.3

Test

Error Log Display

SY27-2510-6

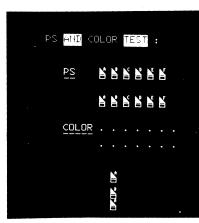

#### Error log codes (3276 Control Unit):

41 Keyboard error (invalid code)71 Adapter receive parity42 Keyboard overrun72 Data parity error\*43 MSR data parity73 Lost Op complete\*44 SP data parity74 Feature timeout\*60 MSR timeout77 Device Check (terminal buffer parity)\*61 SP timeout0A Total count of error code 7070 Timeout (no response from the terminal)\*0B Total count of adapter Receive parity

#### Refer to the control unit manuals for definitions of other error codes.

Example: In the error log for terminal YY, where a horizontal line through 4Z and a vertical line through Z1 meet, the value of XX is 06. This shows that, since the control unit power was turned on, terminal YY has had 6 errors of the 41 code (keyboard error) type, which were sensed by the control unit.

<sup>\*</sup>Control unit may log off device.

# 3.3.2.4 Test 8, PS Feature Test Pattern (Applies Only to the Requesting Termir.al)

Line 1: The letters "PS" and the word "COLOR" will blink. The words "AND" and "TEST" are displayed in reverse video.

Line 3: PS is underscored.

Lines 3 and 5: A symbol is displayed for each PS storage installed. The leftmost symbol is PS "A"; the rightmost is PS "F". A dot is displayed if the PS storage is not installed.

Line 7: "COLOR" is underscored.

Lines 10, 11, and 12: Symbols A, B, and A, respectively, are displayed. Lines 2, 4, 6, and 9 are blank.

#### Notes:

- 1. Model 4 only: Does not display bottom portion of PS symbols on lines 3 and 5.
- 2 Models 3 and 4: There is no space between PS symbols on lines 10 and 11.
- 3. Models 1, 2, 3, and 4: There is no space between PS symbols on lines 11 and 12.

# Chapter 5. Display Image Adjustments

Before checking the following adjustments, determine that all voltages are within tolerance (see MAP 01, step 028), set the Normal/Test switch to the Test position to display the test pattern, and install the alignment mask (PN 1743248) on the display screen.

## 5.1 Yoke Alignment and Centering

Disable vertical deflection by installing jumpers on the analog card test points (see Figure 4-6). Jumper test point A to C and C to B, or wrap a bare wire around all four pins. A single horizontal trace should be displayed. This trace should be parallel to, and vertically and horizontally centered on, line 1 on the alignment mask. If the trace is not parallel to line 1, the yoke must be aligned. If the trace is not centered, the centering rings must be adjusted (see Figure 5-2). In either case, the CRT cone shield must be removed before the adjustment is made.

**5.1.1 Remove Cone Shield.** To remove the cone shield, do the following after removing the top and side covers:

## DANGER

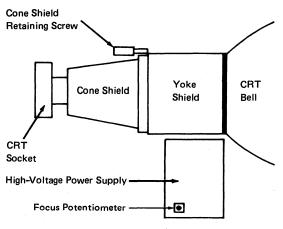

# Switch off the 3278, and then disconnect the power cord.

- 1. Remove the socket from the base of the CRT (see Figure 5-1).
- Loosen the cone shield retaining screw (see Figure 5-1), rotate the cone shield counterclockwise until the locking tabs disengage, and pull the cone shield straight back to clear the CRT neck. Do not remove the yoke or yoke shield.
- 3. Reseat the socket on the CRT base, connect the power cord, and turn on the 3278.

**5.1.2 Yoke Alignment.** To adjust the yoke alignment, do the following:

- 1. Loosen the yoke clamp screw (see Figure 5-2).
- 2. Rotate the yoke by turning the yoke shield until the horizontal trace is parallel to line 1 on the alignment mask.
- 3. Be sure the yoke is firmly seated against the CRT bell, and tighten the yoke clamp screw.

SY27-2510-6 (1/81) 5-1

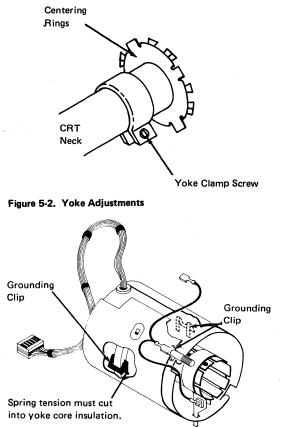

Figure 5-3. Yoke Grounding Clips

**5.1.3 Centering and Horizontal Width.** Turn the centering rings (see Figure 5-2) to center the horizontal trace, both vertically and horizontally, on line 1 of the alignment mask. The width (length of the horizontal trace) should be 266.7 mm (10.5 inches) as indicated by line 2 on the alignment mask. It may be necessary to adjust the width potentiometer, width (80), on the analog card (see Figure 4-6) together with the centering rings.

**5.1.4 Reinstall Cone Shield.** When the yoke alignment, centering, and width adjustments are correct, remove the jumpers from the analog card test points and replace the cone shield by reversing the procedure in paragraph 5.1.1.

### 5.2 Analog Card Adjustments

There are five potentiometers (seven for Model 5) on the analog card (see Figure 4-6) which may need adjustment when the analog card is swapped, or at other times. Check the conditions described in the first paragraph of this chapter before continuing.

# Note: The Normal/Test switch must be in the Test position.

- 1. See paragraph 5.1.3 for a description of the width potentiometer.
- Install a jumper between pins E02 G04 and E02 J08 (D) or F2G12 to F2J08 (M).
- 3. Adjust the top margin potentiometer so the top trace of the first character line is centered on line 3 on the alignment mask for the appropriate model.
- 4. Adjust the character height potentiometer so the bottom trace of the last character line is near the line on the alignment mask for this model of the 3278.
- Remove the jumper installed in step 2, and adjust the row space potentiometer to obtain the total vertical height of 101.6 mm (4 inches) for a Model 1, or 203.2 mm (8 inches) for all other models (line 7).

- 6. For Model 5 only:
  - a. Set the display to 132-character-width mode. For this test the Normal/Test must be in the Normal position and the 3278 must be connected to a properly customized 3274. See step 21 of Test Mode 3 in paragraph 3.3.1.3; use normal cursor.
  - Adjust the height and width potentiometers (Figure 4-6) to screen size as shown on the alignment mask.
- 7. With the intensity control fully clockwise (and released) and the raster blanking potentiometer fully counterclockwise, is the background raster visible? If so adjust the raster blanking potentiometer clockwise to just blank out the raster lines. With the intensity control fully counterclockwise, no display should be visible. Set the intensity control for readability. With the contrast control fully clockwise, the contrast between the high-intensity and normal-intensity fields is maximum. The normal-intensity fields may not display if intensity is set at a low level. Set the contrast control for readability.

#### 5.3 Focus Adjustment

The focus potentiometer is located on the highvoltage power supply (see Figure 5-1). Adjust the focus potentiometer for the best overall definition of the screen image characters at the center and those at the edge of the display area.

#### 5.4 +44 V Power Supply Adjustment Procedures

To adjust the +44 V power supply to the correct operating range (+44 to +48 V), perform the following steps.

#### A. Preparation

- 1. Switch off the 3278.
- 2. Connect the jumper to pin J6 on the lowvoltage power supply. (See Figure 4-11.)
- 3. Switch on the 3278.

#### B. First Measurement

- 1. Measure the voltage at fuse 5 (+) to dc return (-).
- If the voltage is between +44 and +48 V the adjustment is completed. Skip the following steps.

- 3. If the voltage is less than +44 V, go to step C.
- 4. If the voltage is greater than +48 V, go to step D.
- C. Voltage Measured Is Less Than +44 V
- 1. Switch off the 3278.
- 2. Connect the jumper to pin J5. (See Figure 4-11.)
- 3. Switch on the 3278.
- 4. Measure the voltage at fuse 5 (+) to dc return (-).
- 5. If the voltage is between +44 and +48 V, the adjustment is completed. Skip the following steps.
- 6. If the voltage is still less than +44 V, one or more of the following conditions are present:
  - a. The +44 V power supply is defective.
  - b. The ferrotransformer is defective.
  - c. There is a logic or cable short.
- D. Voltage Measured Is Greater Than +48 V (with jumper connected to pin J6)
- 1. Switch off the 3278.
- 2. Connect the jumper to pin J7.
- 3. Switch on the 3278.
- 4. Measure the voltage at fuse 5 (+) to dc return (-).
- 5. If the voltage is between +44 and +48 V, the adjustment is completed. Skip the following steps.
- 6. If the voltage is still greater than +48 V, go to step E.
- E. Voltage Measured Is Greater Than +48 V (with jumper connected to pin J6)
- 1. Switch off the 3278.
- 2. Connect the jumper to pin J9.
- 3. Switch on the 3278.
- 4. Measure the voltage at fuse 5 (+) to dc return (-).
- 5. If the voltage is between +44 and +48 V, the adjustment is completed.
- If the voltage is still greater than +48 V, one or more of the following conditions may be present:
  - a. The +44 V power supply is defective.
  - b. The ferrotransformer is defective.
  - c. There is a logic or cable short.

## Chapter 6. Removals and Replacements

#### 6.1 Covers

All removal and exchange procedures require that the desired unit be made accessible by removing the correct covers. You may leave the top cover on the display station while performing many maintenance procedures. This protects the CRT by partially covering it.

- 1. Front cover: Push backward on the latch at the top center. The cover moves forward at the top while pivoting on two pins at the bottom. Lift the cover off the pins.
- 2. Side covers: Before removing the right side cover, remove the security key, if it is inserted. Pull the front pin (under the front of the side cover) toward the front of the display. When the pin reaches the limit of movement, pivot the rear edge of the cover slightly away from the base and top cover. Lift the cover from the display station. The WTC side covers use a rear retainer spring that prevents movement of the front pin. Release the spring by using a screwdriver on the spring.
- 3. Top/rear cover: The top/rear cover can be removed only after both side covers are removed. Pull out the spring-loaded knobs at the lower right and lower left of the top cover and pivot up. Pull the top cover back slightly to disengage it from the guides in the CRT frame. Carefully lift the cover off the display station.

#### 6.2 Power Units

DANGER: All power unit removal and exchange procedures must be performed with power off and with the power cord disconnected at the wall outlet. (Switch off power before disconnecting the plug.)

#### 6.2.1 Low-Voltage Power Supply

- 1. Remove the low-voltage shield by loosening the screw at the center of the shield.
- 2 Disconnect the two cable connectors (P2 and P3) on the low-voltage supply (J2 and J3), and disconnect the slip-on connector from the tab located at the upper-right corner of the assembly. See Figure 4-11.

- 3. Remove the screw holding the assembly to the lower frame. (The screw is located at the bottom center of the assembly.)
- 4. Slide the assembly partially from the display station, and disconnect the two cables connected on the back of the assembly.
- 5. Slide the assembly from the display station.
- 6. Reinstall in the reverse sequence.
- 7. Use the adjustment procedure in paragraph 5.4 for the +44 V power supply.

#### 6.2.2 AC Capacitor

- Holding the insulated handle of a screwdriver, short out the capacitor terminals with a metal shaft to discharge the capacitor.
- Remove the rubber cover from the top of the capacitor (see Figure 4-3), and slide it back on the wire leads.
- 3. Pull the two leads from the capacitor terminals.
- 4. Pull the capacitor from the spring holder.
- 5. Reinstall in the reverse sequence. (This capacitor has no polarity.)

#### 6.2.3 Prime Power Box

- Disconnect the cable connectors plugged into the rear and top of the prime power box (see Figure 4-3).
- 2. Remove the ac capacitor as described in paragraph 6.2.2.
- 3. Disconnect the line cord from the receptacle if not previously done.
- 4. Remove the two screws holding the prime power box to the front of the frame.
- 5. Remove the assembly from the machine.
- 6. Reinstall in the reverse sequence.

#### 6.2.4 Ferrotransformer

- 1. Remove the low-voltage power supply shield.
- 2. Remove the leads from the ac capacitor as described in paragraph 6.2.2.
- 3. USA/Canada: Remove the ferro connector from the prime power assembly.

#### SY27-2510-6

6-2

- 4. WT except Canada: Disconnect the two wires (two screws) leading from the ferro terminal strip to the prime power assembly. Note where the leads are connected for reinstallation.
- 5. EMEA ferrotransformer only: Remove the screw fastening the ground wire (green/yellow) from the side of the prime power assembly.
- Disconnect the two cable connectors and slip-on connector from the ferrotransformer to the lowvoltage assembly.
- 7. Remove the outer mounting screw holding the ferro to the frame and loosen the inner screw.
- 8. Slide the transformer out of the frame.
- 9. Reinstall in the reverse sequence.
- 10. Check the +44 V supply using procedure 5.4.

#### 6.2.5 High-Voltage Power Supply

- Using an insulated jumper wire, ground the CRT anode terminal to discharge static charge. Carefully disconnect the CRT anode lead; static charge may be present.
- 2. Disconnect the input cable at the lower edge of the high-voltage assembly (see Figure 4-4).
- Open the logic gate by loosening the front mounting screw located in back of the highvoltage supply support shield.
- Remove the high-voltage supply mounting screw located on the back of the high-voltage support shield.
- 5. Slide the power supply out of the support shield.
- 6. Reinstall in the reverse sequence. Ensure that the anode lead is firmly seated on the CRT bell.

#### 6.2.6 Fuses

1. Fuses are located near the line-voltage cord socket and under the low-voltage shield.

#### 6.2.7 Card/Connector Removal and Replacement

**Procedures.** All cards and internal connectors (except the CRT socket) have mechanical locking devices.

#### 6.2.7.1 Internal Connectors

Removal — Pinch the latch tabs together, and pull the connector free from the pins.

Exchanging – Reseat the connector, and ensure that the tabs are latched.

#### 6.2.7.2 Internal Coax

Removal – Press and hold the latch button, and pull the connector free from the pins.

Exchanging – Reseat and ensure that the connector is latched.

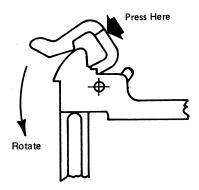

#### 6.2.7.3 Cards

Removal — Unlock and rotate the extractor levers simultaneously at the top and bottom until the card disengages.

Exchanging - Open both extractor levers fully.

Insert the card holder tracks into the front guide fingers (card components towards hinge). Push in until the card holder tracks engage the rear fingers. *Do not use the extractor levers to reseat the card.* Apply firm finger pressure to the card holder (or connector housing for double-ended cards) to ensure proper contact seating.

After reseating, press firmly on the indicated surface of both extractor levers (top and bottom) and rotate simultaneously in the direction shown until latched.

#### 6.2.8 Circuit Board Segments

- 1. Disconnect all the cabling at the gate.
- Remove the top and the bottom board mounting screws.
- 3. Pull the outermost stiffener straight out until it is free of the alignment pins.
- 4. Remove the affected circuit board segment(s) by inserting the guide pins into the alignment holes in the inner stiffener, starting in card column "H". Ensure that the numerals and "This Side Out" (pin side) face out and that the "arrows" point upward. Seat the segment(s) firmly into all the card connectors.
- 5. Reinstall the outer stiffener over the alignment pins with the numeral "2" at the top and the "arrows" pointing upward.
- Reinstall the mounting hardware and ensure that the card holders are equally centered in the gate opening; then tighten the screws and reinstall the cabling.
- 7. Check by using procedure 3.3.1 through step 2 of 3.3.1.3 (Test Mode 3) and procedure 3.3.2.2.

#### 6.3 CRT

#### DANGER

All persons handling a CRT or who are near an exposed CRT under vacuum must wear safety glasses and long-sleeved garments.

- Disconnect the power cord at the wall receptacle.
- 2. Remove the left, right, and top covers.
- Open the logic gate by loosening the front mounting screw located in back of the highvoltage supply.
- 4. On units with the security keylock feature:
  - a. Mark the location of the keylock assembly mounting bracket on the side of the frame.

- b. Remove the screws holding the bracket to the frame.
- c. Place the keylock assembly to give access to the lower-right CRT holding nut.
- 5. Using an insulated jumper wire, ground the CRT anode to discharge electricity.
- 6. Carefully disconnect the CRT anode lead. There may be an electric charge on the anode.
- Disconnect the CRT socket ground lead from the CRT bell ground strap, located in front of the yoke assembly.
- 8. Remove the socket from the end of the CRT.
- 9. Remove the cone shield from the end of the CRT:
  - a. Loosen the cone shield retaining screw.
  - b. Turn the cone counterclockwise until the locking tabs disengage.
  - c. Pull the cone shield straight back and free of the CRT.
- 10. Remove the yoke ground wire from the CRT bell ground strap.
- Loosen the yoke clamp screw, slide the yoke assembly off the CRT, and place it on the upper frame.
- 12. Open the new CRT container, and place the pad on a stable surface near the display station to support the old CRT when it is removed.

Caution: The following steps free the CRT from its mounting. The CRT weighs about 7.25 kg (16 pounds). Protect and support the CRT from too much pressure, which could damage the CRT or other units.

- 13. Remove the CRT holding nuts (4).
- 14. With the CRT resting on the mounting studs, carefully remove the grounding straps.
- 15. Connect the lifting strap (supplied with the new CRT) to the top CRT mounting tabs.
- 16. Carefully slide the CRT toward the rear of the display station and lift it from the unit.
- 17. Place the CRT face down on the pad.
- 18. Install the new CRT in the reverse sequence.

6-6

- 19. When tightening the CRT mounting nuts, ensure that the ground strap is flat against the CRT bell and under the spring. Gradually tighten the nuts, alternating from nut to nut until all are fully tightened.
- 20. See that the yoke cable is located at the top when replacing the yoke assembly.
- 21. Perform all display station image adjustments (see Chapter 5).
- 22. Tighten the yoke mounting screws after adjustments.

#### 6.4 Yoke and Shields

The yoke and shield assemblies are removed from the CRT neck as a unit. After the assemblies are removed, they can be separated.

**Note:** The top and rear covers must be removed, and the logic gate must be opened.

- Disconnect the yoke cable from the gate, and disconnect the ground wire(s) from the CRT bell ground strap.
- Cut the yoke cable fasteners on the logic gate, and support. Disconnect the CRT socket ground lead from the CRT bell ground strap, located in front of the yoke assembly.
- 3. Remove the socket from the base of the CRT.
- 4. Remove the cone shield from the base area of the CRT:
  - a. Loosen the shield retaining screw.
  - b. Turn the cone shield counterclockwise until the locking tabs disengage.
  - c. Pull the cone straight back and clear of the CRT.
- 5. Loosen the yoke clamp, and carefully slide the assembly off the CRT.
- 6. Remove the clamp from the centering magnet assembly.
- 7. Separate the yoke from the shield by pressing the plastic tabs (4) located around the shield circumference, and slide the yoke forward (away from the clamp).

8. Remove the two grounding clips, noting the positions of these clips, and install them in the same positions on the new yoke.

Caution: Do not cut into the yoke wiring with the clips. Also ensure that the clips are cutting through the white insulation coating on the yoke core.

9. Before removing the centering magnet assembly from the yoke, note the orientation of the centering magnet assembly guides in relation to the split in the yoke windings. This assembly must be reinstalled with the assembly guides in the same orientation or the yoke wiring will not be positioned properly when installed in the shield. Remove the centering magnet assembly by lifting the four plastic tabs, and install them on the new yoke with the same orientation that they had on the old yoke.

# Caution: Ensure that the centering magnet assembly guides are lined up with the split in the yoke winding.

- 10. Reinstall in the reverse sequence.
- 11. See that the yoke cable is located at the top when replacing the yoke assembly.
- Push the yoke tightly against the CRT bell when tightening the yoke clamp. Do not tighten the screw fully until after the adjustments have been made.
- 13. Perform all the display image adjustments (see Chapter 5).
- Tighten the yoke mounting screw fully after the adjustment.

#### 6.5 Operator Controls

Operator controls are mounted to the CRT mask assembly. The mask assembly must be removed to replace any of the following controls.

#### 6.5.1 CRT Frame Assembly

- 1. Remove the side and top covers.
- Disconnect the On/Off switch cable connector from the top of the prime power box and remove the rubber cable retainer.
- 3. Remove the two screws from the upper rear of the CRT support.
- 4. While pulling the mask forward, press the plastic tabs located under the top cover ground spring, near the on/off switch, and near the intensity control.
- 5. Pivot the mask down in front of the unit.

#### 6.5.2 On/Off Switch

- 1. Remove the rubber clamp from the cable clamp.
- 2. Press the plastic catch at the rear of the switch to one side, and pull the switch out.

#### 6.5.3 Intensity and Contrast Controls

- 1. Pull off the two knobs and spacer or the audible alarm knob.
- 2. Disconnect the connector, and slip it out of the fasteners.
- 3. Expand the spring clips (2) with a screwdriver, and pull the control assembly off the pins.

#### 6.5.4 Indicator Card Assembly

- 1. Remove the screw with spring.
- 2. Remove the connector and card assembly.

#### 6.5.5 Switches

- 1. Remove the cable connectors. (Note where the leads are connected for reinstallation.)
- 2. Press the spring latch, and remove the switch.
- 3. Reinstall in the reverse sequence.

#### 6.6 Optional Features

#### 6.6.1 Audible Alarm

The audible alarm circuits are in a small metal box on the logic gate.

- 1. Remove the audible alarm box from the gate by loosening the mounting screws.
- 2. Remove the circuit board from the metal box.
- 3. Remove the cable wires from the audible alarm circuit board with longnose pliers or with a small screwdriver.
- 4. Reinstall in the reverse sequence. The circuit board is marked with the color code of wires to be connected.

#### 6.6.2 Security Keylock

- 1. Remove the screws that hold the keylock assembly to the frame.
- Remove the keylock assembly cover.
- 3. Remove the cable leads from the switch with pliers or with a small screwdriver. Note the terminals from which the leads are removed (for later connection).
- 4. Remove the cable fastener from the hole in the switch assembly.
- 5. Remove the cable from the keylock assembly.
- 6. Reinstall in the reverse sequence. Be sure to align the keylock assembly with the hole in the right side cover.

#### 6.7 Keyboard Units

This section describes the procedures for removing and reinstalling the keyboard units. The following equipment may be required:

Keytop puller tool	-	PN 9900373 (preferred), PN 75475, or PN 627953
lsopropyl alcohol	-	PN 2200200 (or IBM tape transport cleaner - PN 453511)
Cloth (lint-free)	-	PN 2108930 (or tissue - PN 2123106)

SY27-2510-6

#### 6.7.1 Keyboard from Display Station

- 1. Switch off power.
- 2. Remove the display station front cover.
- Remove the cable ground wing nut from the frame.
- 4. Free the cable fastener, and remove the keyboard cable connector from its socket.
- 5. Reinstall in the reverse sequence.
- Ensure that all cable connectors are tightly seated in the sockets and that the ground straps are attached.

#### 6.7.2 Keyboard Top Cover

- 1. Invert the keyboard.
- Remove the four screws in the corners of the keyboard base.
- Place the keyboard base on a flat surface.
- 4. Lift the top cover off the keyboard.
- 5. Reinstall in the reverse sequence.

**Note:** Check for cover clearance around the keys after the cover has been reinstalled. Adjust if required.

#### 6.7.3 Keyboard Assembly from Base

- 1. Switch off power.
- 2. Disconnect the keyboard from the display station. (See par. 6.7.1.)
- Remove the keyboard top cover. (See par. 6.7.2.)
- 4. Disconnect the keyboard cable connector and clicker connector at the logic card.
- 5. Remove the two screws that hold the keyboard assembly to the mounting. (Mark for alignment reference.)
- Lift the keyboard assembly off the mounting and remove the logic card assembly from the keyboard per paragraph 6.7.8.
- 7. Reinstall in the reverse sequence.
- 8. Ensure that the cable connector is tightly seated.

#### 6.7.4 Clicker Assembly

- 1. Switch off power.
- 2. Disconnect the keyboard from the display station. (See par. 6.7.1.)
- 3. Remove the keyboard top cover. (See par. 6.7.2.)
- 4. Remove the keyboard assembly from the base. (See par. 6.7.3.)
- 5. Disconnect the clicker connector.
- 6. Remove the clicker assembly by sliding the bail fastener from under the cast tabs.
- 7. Reinstall in the reverse sequence.

#### 6.7.5 Keybutton

Remove buttons by sliding the keytop puller tool over the keytop and pulling straight up.

#### 6.7.6 Key Module

The work area must be clean during work on the keyboard. Any particle between the key module flyplate and the printed circuit is a possible problem.

- 1. Switch off power.
- Disconnect the keyboard from the display station. (See par. 6.7.1.)
- 3. Remove the keyboard top cover. (See par. 6.7.2.)
- 4. Remove the keybutton from the module that will be swapped. (See par. 6.7.5.)
- 5. Remove the keyboard assembly from the base. (See par. 6.7.3.)
- 6. Invert the keyboard, and place it on the base pins located on the left and right sides.

#### 6.7.6.1 Key Module Removal (Including Spacer Module)

**Note:** See par. 6.7.7A, Spacebar Removal, if the spacebar module is to be swapped.

1. Remove the screws that hold the base plate and circuit board to the all-keys assembly.

- 2. Lift the circuit board from the all-keys assembly, and place the circuit board on its base in a clean area.
- 3. Handle the all-keys assembly by the sides. Be careful not to press any keys. Lift the all-keys assembly off the base, turn it over, and place it on the base.

**Note:** Swap the key module if the flyplate comes off. Do not attempt to repair the module. Repaired modules can cause intermittent failures.

- Press down on the key module until it is free of the holding plate.
- 5. Lift the edge of the all-keys assembly nearest the key module that has just been removed. Remove the bad module.
- 6. Lift the all-keys assembly by the edges, and invert it on its base.

#### 6.7.6.2 Key Module Replacement

- 1. Ensure that the alignment tab and the angled keystem are in the same position as those of the other modules in the all-keys assembly.
- 2. Install the new module (PN 1748131) by pressing the key module into the holding plate by hand.
- 3. Clean the printed circuit board by carefully wiping it with a lint-free cloth moistened with isopropyl alcohol. Inspect all key module flyplates for any foreign matter, and carefully clean if needed.
- 4. Align the holding screw holes through the baseplate, circuit board, insulator, and top insulator (if used). Lower the circuit board assembly on the all-keys assembly. Secure the circuit board to the all-keys assembly with the holding screws.
- 5. Reinstall the keyboard assembly on the base, maintaining its original alignment.
- 6. Reinstall the keybutton in the correct location.

- 7. Reinstall the keyboard cable connector and clicker cable to the logic card. Reinstall the keyboard top cover, and reconnect the keyboard to the display if it was removed.
- 8. Use test mode 2 to check for correct operation of the keyboard.

#### 6.7.7 Spacebar

Perform the removals described in pars. 6.7.1 and 6.7.2 for access to the keyboard assembly.

- A. Spacebar Removal
- Hold the spacebar button at each end (beyond the modules), and remove by pushing upward evenly.
- Remove pivots (if necessary) by pushing with a screwdriver in the slot in the side of the pivot.
- B. Spacebar Exchange
- 1. Press any pivots removed in step 2 (above) into the mounting frame.
- 2. Place the spacebar button on its modules, and lower it into position while engaging the bar in the two pivots.
- 3. Press down on the spacebar at the spacebar modules to seat the spacebar button.
- Check the spacebar operation for binds. If it binds, the probable cause is a bent right module stem. This stem can be shaped to free the bind.
- Install the keyboard top cover, and reconnect the keyboard to the display if it was previously removed.

#### 6.7.8 Logic Card Assembly

- 1. Disconnect the keyboard from the display station.
- 2. Remove the keyboard top cover. (See par. 6.7.2.)
- 3. Disconnect the keyboard cable connector and clicker connector at the logic card.
- 4. Remove the two holding screws from each end of the logic card.

#### SY27-2510-6

5. Remove the logic card by pressing outward on each end of the 30-pin connector housing (points A in Figure 4-10).

Reinsert the card by applying pressure inward on the same area of the 30-pin connector housing as for removal.

**Note:** Always remove and insert the logic card by applying pressure to the 30-pin connector housing. Do not pull, tilt, or press on the card area.

6. Reinstall in the reverse sequence.

**Note:** Check that the keyboard ID jumpers on the new logic card are in the same positions as on the old logic card. See Figure 4-10.

#### 6.8 Selector Pen

- 1. Switch off the unit.
- 2. Hold rear portion of barrel and selector-pen cord in one hand. Unscrew cone-shaped tip counterclockwise to remove the lens assembly.
- Reinstall the lens assembly, and screw the coneshaped tip clockwise to reassemble the selector pen.

Caution: Do not overtighten the cone-shaped tip when reassembling.

## Chapter 7. Magnetic Slot Reader Information

The magnetic slot reader (MSR) and the magnetic hand scanner (MHS) are devices used to read data encoded on different types of magnetic striped documents, such as adhesive labels on card stock, tags, and plastic cards. An audio beeper and three light indicators present feedback information to the operator.

The MSR components are packaged in a plastic housing which has a slot that serves as the document path. The MHS is a hand-held device whose components are also packaged in a plastic housing. The repair and maintenance of both devices is a customer responsibility.

Neither device may read magnetic stripes accurately if the stripes contain any of the following defects: tears, scratches, contaminants, demagnetized areas, wrinkles (surface irregularities), and voids.

Head element cleaning is performed by the customer as required. The recommended method of cleaning is to wipe the element with a cloth wetted with isopropyl alcohol. Refer the customer to the *Magnetic Hand Scanner – Magnetic Slot Reader Replacement Procedures* manual, GA24-3663.

#### Appendix A. Glossary

The terms defined in this glossary apply to the 3278 Display Station and its attachment to the 3274 and 3276 Control Units.

Analog card: A circuit card that converts digital information into high-level signals for writing characters on the display screen.

*Attribute:* A byte of data that specifies the kind of display field. An attribute can specify the field as protected or unprotected, for numeric, alphanumeric, intensity, selector-pen detectability, and modification.

*Bell:* The sides of the cathode-ray tube (CRT) between the display screen and the neck. (See Figure 5-2.)

*Blanking:* The ability to prevent writing on the screen.

*Clicker:* An assembly that, when enabled, generates a small sound when a key on the keyboard is pressed. The sound indicates to the operator that the keyboard has recognized the key pressed.

Coax: A shielded cable containing a single conductor.

*Cone shield:* A shield mounted on the neck of the CRT. (See Figure 5-1.)

*Contrast:* The difference in light intensity between displayed characters.

*Cursor:* An underscore symbol that identifies a character position in a screen display, usually the character position at which the next character to be entered from the keyboard will be displayed.

(D): The logic type using three base cards. (See Figures 1-1, 4-6, and 4-7.)

*Divider scan:* The straight line that is continuously written on the display screen above the bottom line. (See Figure 3-1.)

*Dual intensity:* The ability to have two levels of brightness for the characters displayed on the display screen.

Ferro: The ferrotransformer. (See Figure 4-3.)

*Filament:* An internal part of the CRT, located in the neck, that glows when voltage is applied.

*Flyplate:* The part of the key module, suspended on springs, that snaps on the circuit board when the keybutton is pressed.

*Handrest:* The part of the keyboard cover where the heel of the hand can be placed for greater ease in entering data and operating the repeat-action keys.

*Keybutton:* The molded keytop that is installed on the keystem.

(*M*): The logic type using two base cards. (See Figures 1-2, 4-8, and 4-9.)

*Mask:* The frame surrounding the display screen. (See Figure 4-5.)

*Neck:* The narrow portion of the CRT between the bell and the CRT socket. (See Figure 5-1.)

*Prime:* The compartment where the power cord is attached to the display station.

*Raster:* The visual sweep of the electron beam on the display screen. The raster is normally present only when the intensity control is in the override position.

Security Keylock: A key-operated switch that allows use of the display station.

*Sweep:* A single movement of the electron beam, either vertically or horizontally, on the display screen.

*Top card connector:* A connector that is used to provide additional connections between two or more logic cards that have connectors on the edge of the card opposite the card base.

*Yoke:* The deflection coil assembly that is installed on the CRT neck. (See Figures 4-5 and 5-1.)
