05/08/2019

Computer Instruction Word Format: TIIAABBMMMMM
Processor Instruction Word Format: IINNNNNMMMMM

T = trace
II = instruction opcode
AA $=$ arithmetic register
BB = index register
NNNNN $=$ memory address, control fields, registers, device/synchronizer selects, etc.
МММММ = memory address
$+,-, \mathrm{x}, \div \quad=$ fixed point
$\oplus, \otimes, \odot \quad=$ floating point
' = double word
| = absolute value or magnitude
[ ] Rdd = rounded result
0500000 [ ] = extend a short number to 12 digits by prepending specified constant digits
00[] $00000=$ extend a short number to 12 digits by appending specified constant digits
\{ \} = clarifying comments

Instruction description pseudocode syntax loosely adapted from Ada.
Table colors loosely adapted from "Moore Business Forms, Inc FORM 1488TG SPEEDIREAD WITH EYE TRACK" printer paper, which was used on the Univac 1106 and Univac 1110 that I ran programs on in college.

[^0]:    1 Instruction Mnemonics shown for Computer Instructions. See documents: LARC Computing-Unit Instructions, Univac® LARC Programming the Computing Unit, An Introduction to the LARC® Data-Processing System. Behavior of Illegitimate Computer Instructions does not seem to be defined in these documents.
    2 Instruction Mnemonics not shown for Processor Instructions. Univac may not have documented them as they provided a standard Processor program that the Computers could request services from as needed. See documents: Univac® LARC Processor Instruction and Function-Signal Analyses, An Introduction to the LARC® Data-Processing System. Illegitimate Processor Instructions result in either a Stall Error or a Timeout Error, stopping the Processor.

[^1]:    7 The console printer 1 is on Computer 1's engineer control console, the console printer 2 is on Computer 1's operator control console, the console printer 3 is on Computer 2's engineer control console, the console printer 4 is on Computer 2's operator control console (in a two Computer system, no such LARC system was ever built).
    8 The manual intervention buttons $0 . .4$ are on Computer 1's operator control console, the manual intervention buttons $5 . .9$ are on Computer 2's operator control console (in a two Computer system, no such LARC system was ever built).

[^2]:    9 The console printer 1 is on Computer 1's engineer control console, the console printer 2 is on Computer 1's operator control console, the console printer 3 is on Computer 2's engineer control console, the console printer 4 is on Computer 2's operator control console (in a two Computer system, no such LARC system was ever built).

[^3]:    10 Field designation of Instruction 98 changed from C to B to avoid confusion with C register.

[^4]:    11 Behavior in this situation not explicitly specified in Univac® LARC Processor Instruction and Function-Signal Analyses. Logical inference is that if force transfer switch is off Instruction 98 continues after start without jumping.
